A HISTORY OF WORLD SOCIETIES

Take the lead in succeeding in your history course.

Taking your first college history course might seem like a challenge. These excerpts from the **Bedford Tutorials for History** will give you tools for succeeding in your history course.

Taking Effective Notes

Lectures and reading assignments present large amounts of information that can be overwhelming. Here are a few tips for taking effective notes.

Establish Shortcuts to Facilitate Taking Legible Notes

To speed up your note-taking and yet still have notes you can read, use abbreviations and symbols to indicate commonly used words and ideas. Text-messaging conventions are transferrable to note-taking — for example, use “w/o” for “without” and “b/c” for “because.” In your history class, you can use “c.” for “century” and establish other shortcuts for commonly used historical terminology.

Organize Your Notes and Be Selective

Every time you begin a new set of notes, include the date and subject at the top of the page. Focus on the big ideas and include the concrete examples and details needed to illustrate and support those ideas. Your goal is to create notes that are brief yet understandable.

Working with Primary Sources

A primary source is a document, object, or image created during the time period under study. Sometimes, historical documents can be difficult to understand because of their form or language. Here are questions you can ask when analyzing primary sources.

- ***Who produced this document, when, and where?***
  Identifying the author of a primary source is important because it helps expose the author's point of view. We need to know something about how the author or artist viewed the world and how he or she came to produce the document or visual source.

- ***Who was the intended audience of the document?***
  There is often a close connection between a document and its intended audience. The historical importance of a document is partly determined by who read it.

- ***What are the main points of the document?***
  While reading, start to make connections between the main points of the document and the specific choices the author made in style, organization, content, and emphasis.

- ***What does this document reveal about the time and place in which it was written?***
  Often there is no single right answer to this question because readers bring their own goals and purposes to their analyses and use the evidence found in the document to draw their own conclusions about the document's historical meaning.

Avoiding Plagiarism and Managing Sources

Most students are aware that plagiarism can be committed on purpose, but unintentional or accidental plagiarism is also problematic. Keeping track of source material has always been tough, and technology has made it easy to cut text from an online source and copy it into your paper. You may have intended to modify or acknowledge it later but then forgot where it came from. Omitting a citation of a source by accident is still a breach of academic ethics. Here are four steps that you can use to help avoid plagiarism.

Step 1: Manage Sources Efficiently

Many academic professionals and students take notes and keep track of sources using index cards. Write one piece of evidence — a quote, a fact, an idea — on each card along with the original source of that data. This can also be done electronically, by creating a single file for each source that you consult and housing all of these files in a folder called “Sources.”

Step 2: Use Sources Properly

Using sources properly as you take notes and incorporate them into your writing is another crucial component of the research and writing process. You will not be able to cite your sources properly if you don't know which note is a quote, which note is a partial paraphrase of another author's point, and which one is paraphrased fully.

Step 3: Acknowledge Sources Appropriately

There are some general rules about what types of information require citation or acknowledgment and what types do not. Widely accepted facts or common knowledge do not need to be cited, but another person's words or ideas (even if not quoted verbatim) require a citation.

Step 4: Cite Sources Completely and Consistently

Historians and others writing about history have adopted the citation guidelines from the *Chicago Manual of Style* (CMS). The citations are indicated by superscript numbers within the text that refer to a note with a corresponding number either at the bottom of the page (footnote) or at the end of the paper (endnote). Here are just a few brief examples of CMS-style notes.

Book:	David Brion Davis, *Inhuman Bondage: The Rise and Fall of Slavery in the New World* (New York: Oxford University Press, 2006), 73.

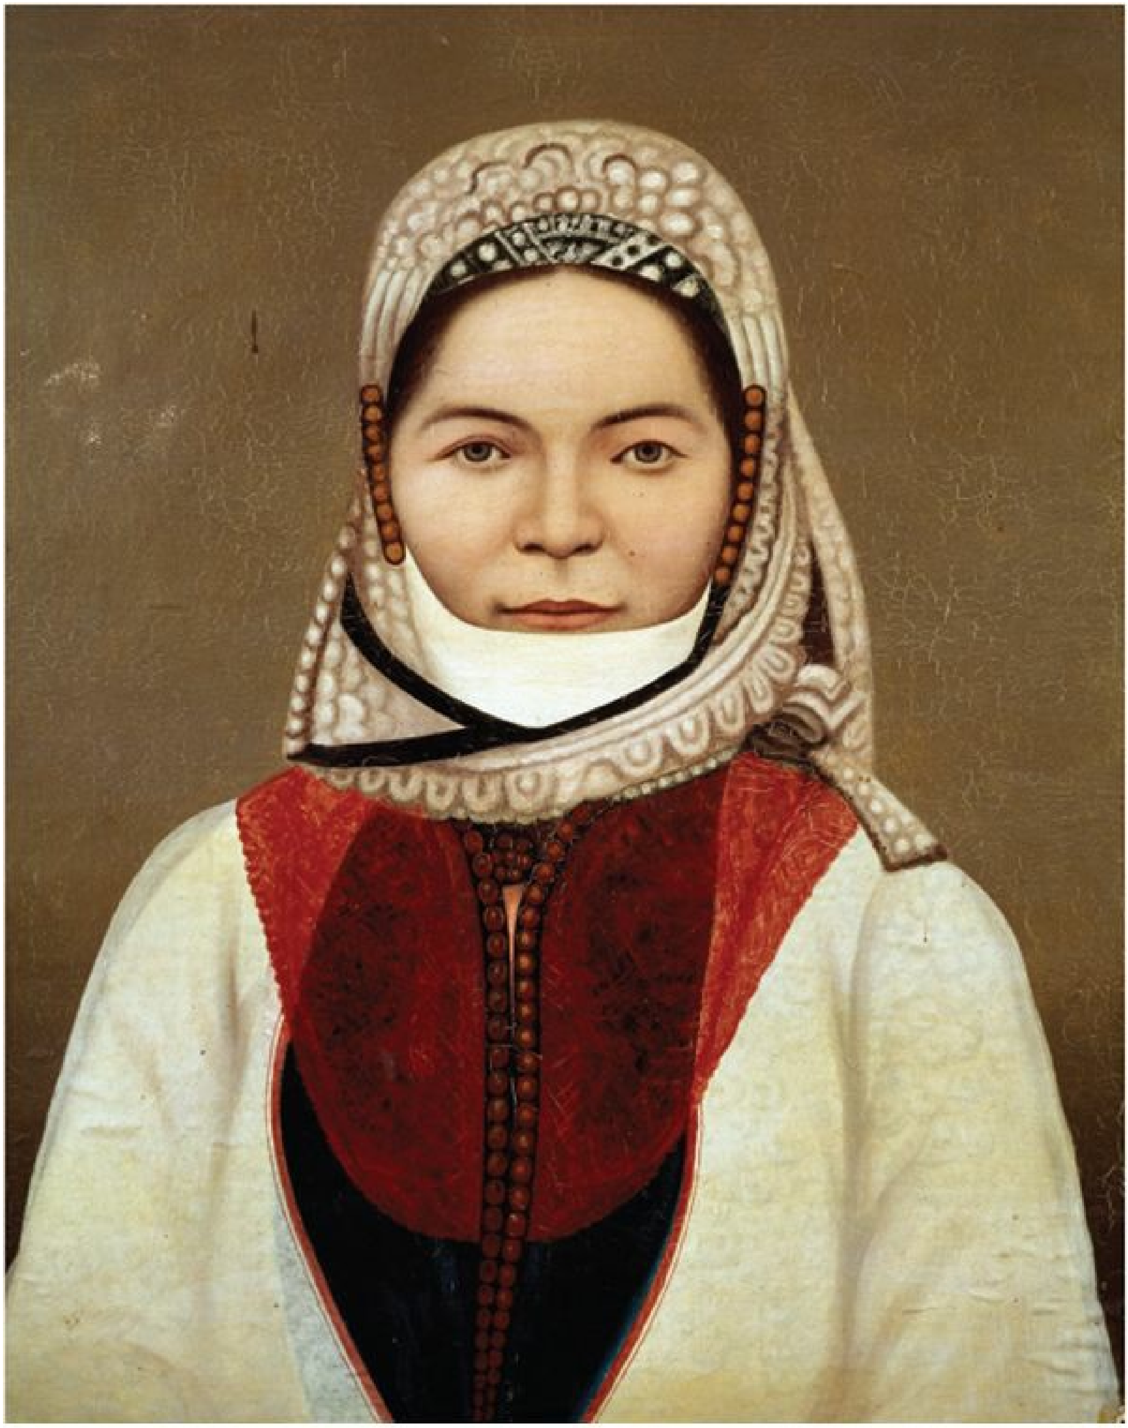
Armenian woman from Isfahan, painting, 20th century



Armenian Woman from Isfahan, painting, 20th century / Armenian Cathedral and Museum, Julfa, Isfahan, Iran / De Agostini Picture Library / G. Dagli Orti / Bridgeman Images

In this painting by an unknown artist from the early twentieth century, an Armenian woman wearing an elaborate headdress and brocade jacket gazes serenely at the viewer. Her clothing is what became defined as "Armenian national dress," one of many national and ethnic costumes largely invented during the period of growing nationalism in the nineteenth century but claimed as part of much older traditions. Armenia was a kingdom in southwest Asia that adopted Christianity in the fourth century. Conquered by various empires over the centuries, Armenians scattered and developed global trading networks that for a time centered on Isfahan (now in Iran), where this painting is located. Many Armenians remained in Armenia, which became part of the Ottoman Empire, until Ottoman authorities during World War I ordered their mass deportation to the Syrian Desert, a genocidal policy through which hundreds of thousands died from exhaustion, starvation, or massacre.

Preface

Why This Book This Way

The world is becoming ever more interconnected, and the eleventh edition of *A History of World Societies* responds to this reality. To the social and cultural focus, comprehensive regional organization, and global perspective that have long been its hallmarks, we have added features that emphasize connections and parallel developments. Each of the authors on our collaborative team is a regional expert with deep experience in teaching world history, who brings insights into the text from the classroom, as well as from new secondary works and his or her own research in archives and libraries. In response to the growing emphasis on historical thinking skills in the teaching of history at all levels, as well as to requests from our colleagues and current adopters, we have significantly expanded the book’s primary source program to offer a wide variety of sources, both written and visual, presented in several ways. Every chapter now includes Thinking Like a Historian, which groups approximately five sources around a central question; Global Viewpoints, which presents two sources from different parts of the world on the same issue; and Analyzing the Evidence, which features an individual text or visual source. We now have more primary sources than ever before and innovative tools — both print and digital — designed to help students think historically and master the material.

The Story of *A History of World Societies*

In this age of global connections, with their influence on the economy, migration patterns, popular culture, and climate change, among other aspects of life, the study of world history is more vital and urgent than ever before. An understanding of the broad sweep of the human past helps us comprehend today’s dramatic changes and enduring continuities. People now migrate enormous distances and establish new lives far from their places of birth, yet migration has been a constant in history since the first humans walked out of Africa. Satellites and cell phones now link nearly every inch of the planet, yet the expansion of communication networks is a process that is thousands of years old. Children who speak different languages at home now sit side by side in schools and learn from one another, yet intercultural encounters have long been a source of innovation, transformation, and at times, unfortunately, conflict.

This book is designed for twenty-first-century students who will spend their lives on this small interconnected planet and for whom an understanding of only local or national history will no longer be sufficient. We believe that the study of world history in a broad and comparative context is an exciting, important, and highly practical pursuit. It is our conviction, based on considerable experience in introducing large numbers of students to world history, that a book reflecting current trends in scholarship can excite readers and inspire an enduring interest in the long human experience.

Our strategy has been twofold. First, we have made social and cultural history the core elements of our narrative. We know that engaging students' interest in the past is often a challenge, but we also know that the emphasis on individual experience in its social and cultural dimensions connects with students and makes the past vivid and accessible. We seek to re-create the lives of ordinary people in appealing human terms and also to highlight the interplay between men's and women's lived experiences and the ways they reflect on these to create meaning. Thus, in addition to foundational works of philosophy and literature, we include popular songs and stories. We present objects along with texts as important sources for studying history, and this has allowed us to incorporate the growing emphasis on material culture in the work of many historians. At the same time, we have been mindful of the need to give great economic, political, and intellectual developments the attention they deserve. We want to give individual students and instructors an integrated perspective so that they can pursue — on their own or in the classroom — the themes and questions that they find particularly exciting and significant.

Second, we have made every effort to strike an effective global and regional balance. The whole world interacts today, and to understand the interactions and what they mean for today's citizens, we must study the whole world's history. Thus we have adopted a comprehensive regional organization with a global perspective that is clear and manageable for students. For example, Chapter 7 introduces students in depth to East Asia, and at the same time the chapter highlights the cultural connections that occurred via the Silk Road and the spread of Buddhism. We study all geographical areas, conscious of the separate histories of many parts of the world, particularly in the earliest millennia of human development. We also stress the links among cultures, political units, and economic systems, for these connections have made the world what it is today. We make comparisons and connections across time as well as space, for understanding the unfolding of the human story in time is the central task of history. We further students' understanding of these connections with the addition of new timelines in each chapter that put regional developments into a global context.

Primary Sources for Historical Thinking

A History of World Societies offers an extensive program of primary source assignments to help students master a number of key learning outcomes, among them **critical thinking**, **historical thinking**, **analytical thinking**, and **argumentation**, as well as learning about the **diversity of world cultures**. For this eleventh edition, we have added a new feature, **Thinking Like a Historian** (one in each chapter), which typically groups five or six textual or visual sources around a central question, with additional questions to guide students' analysis of the evidence and a "Putting It All Together" assignment that asks them to synthesize the sources with what they have learned in class and use the evidence to create an argument. Topics include "Slavery in Roman and Germanic Society" (Chapter 8), "When and Why Did Foot Binding Begin?" (Chapter 13), "Forced Relocation of Armenians to Persia" (Chapter 17), "The Rights of Which Men?" (Chapter 22), and "The Relationships Between Mosquitoes, People, and Epidemics" (Chapter 33).

To encourage comparisons across chapters and across cultures, we have sharpened the focus of the **Global Viewpoints** feature, which provides students with perspectives from two cultures on a key issue. This feature offers a pair of primary documents on a topic that illuminates the human experience, allowing us to provide more concrete examples of differences in the ways people thought. Anyone teaching world history has to emphasize larger trends and developments, but students sometimes get the wrong impression that everyone in a society thought alike. We hope that teachers can use these passages to get students thinking about diversity within and across societies. The 33 Global Viewpoints assignments — one in each chapter — introduce students to working with sources, encourage critical analysis, and extend the narrative while giving voice to the people of the past. Each includes a brief introduction and questions for analysis. Carefully chosen for accessibility, each pair of documents presents views on a diverse range of topics such as "Roman and Chinese Officials in Times of Disaster" (Chapter 6), "Early Descriptions of Africa from Egypt" (Chapter 10), "Aztec and Spanish Views on Christian Conversion in New Spain" (Chapter 16), "Declarations of Independence: The United States and Venezuela” (Chapter 22), and “Gandhi and Mao on Revolutionary Means” (Chapter 29).

A third type of original source feature, **Analyzing the Evidence** (two in each chapter), features an individual visual or written source, longer and more substantial than those in other features, chosen to extend and illuminate a major historical issue considered in each chapter, with headnotes and questions that help students understand the source and connect it to the information in the rest of the chapter. Selected for their interest and carefully integrated into their historical context, these in-depth looks at sources provide students with firsthand encounters with people of the past and should, we believe, help students “hear” and “see” the past. Topics include “The Teachings of Confucius” (Chapter 4), “Orthodox Icon of Jesus” (Chapter 8), “Abu Hamid al-Ghazali on the Etiquette of Marriage” (Chapter 9), “Courtly Love Poetry” (Chapter 14), “Lamu Old Town, Lamu Island, Kenya” (Chapter 20), “*Rain, Steam, and Speed — the Great Western Railway*” (Chapter 23), “Reyita Castillo Bueno on Slavery and Freedom in Cuba” (Chapter 27), “C. L. R. James on Pan African Liberation” (Chapter 31), “A Member of China’s Red Guards on Democratic Reform” (Chapter 32), and “A Brazilian Band on Globalization” (Chapter 33).

Taken together, the primary source features in this book offer the tools for building historical skills, including **chronological reasoning**, **explaining causation**, **evaluating context**, and **assessing perspective**. The suggestions for essays based on the primary sources encourage students to further expand their skills as they use their knowledge to develop historical arguments and write historical analyses. In LaunchPad these features are each accompanied by autograded questions that test students on their basic understanding of the sources so instructors can ensure students read the sources, quickly identify and help students who may be struggling, and focus more class time on thoughtful discussion and instruction.

In addition, our **primary source documents collection**, *Sources of World Societies*, includes written and visual sources that closely align the readings with the chapter topics and themes of this edition. The documents are available in a fully assignable and assessable electronic format within each chapter in LaunchPad, and the multiple-choice questions — now accompanying each source — measure comprehension and hold students accountable for their reading.

Finally, our new **Bedford Document Collections** modules in LaunchPad, which are also available for customizing the print text, provide a flexible repository of discovery-oriented primary source projects ready to assign. Each curated project — written by a historian about a favorite topic — poses a historical question and guides students through analysis of the sources. Examples include “The Silk Road: Travel and Trade in Premodern Inner Asia”; “The Spread of Christianity in the Sixteenth and Early Seventeenth Centuries”; “The Singapore Mutiny of 1915: Understanding World War I from a Global Perspective”; and “Living Through Perestroika: The Soviet Union in Upheaval, 1985–1991.”

Student Engagement with Biography

In our years of teaching world history, we have often noted that students come alive when they encounter stories about real people in the past. To give students a chance to see the past through ordinary people’s lives, each chapter includes one of the popular **Individuals in Society** biographical essays, each of which offers a brief study of an individual or group, informing students about the societies in which the individuals lived. This feature grew out of our long-standing focus on people’s lives and the varieties of historical experience, and we believe that readers will empathize with these human beings who themselves were seeking to define their own identities. The spotlighting of individuals, both famous and obscure, perpetuates the book’s continued attention to cultural and intellectual developments, highlights human agency, and reflects changing interests within the historical profession as well as the development of “micro-history.” **NEW** features include essays on Catarina de San Juan, an Indian woman who was enslaved by Portuguese traders and transported to Mexico (Chapter 16); Rebecca Protten, a former slave from Antigua who was part of a mixed-race marriage with a German Moravian missionary (Chapter 19); and Samuel Crompton, inventor of the spinning mule (Chapter 23).

Geographic Literacy

We recognize students’ difficulties with geography, and the new edition retains our **Mapping the Past map activities**. Included in each chapter, these activities ask students to analyze a map and make connections to the larger processes discussed in the narrative, giving them valuable practice in reading and interpreting maps. In LaunchPad, these maps come with new assignable activities. Throughout the textbook and online in LaunchPad, nearly **100 full-size maps** illustrate major developments in the chapters. In addition, **75 spot maps** are embedded in the narrative to show specific areas under discussion.

Chronological Literacy in a Global Context

The increased attention to global connections and comparisons that marks this edition can also be seen in new timelines at the end of each chapter. Along with graphically displaying major events and developments from the chapter, they also include key developments in other regions with cross-references to the chapters in which they are discussed. These comparisons situate events in the global story and help students identify similarities and differences among regions and societies.

Helping Students Understand the Narrative

We know firsthand and take seriously the challenges students face in understanding, retaining, and mastering so much material that is often unfamiliar. With the goal of making this the most student-centered edition yet, we continued to enhance the book’s pedagogy on many fronts. To focus students’ reading, each chapter opens with a chapter preview with focus questions keyed to the main chapter headings. These questions are repeated within the chapter and again in the “Review and Explore” section at the end of each chapter that provides helpful guidance for reviewing key topics. “Review and Explore” also includes “Make Comparisons and Connections” questions that prompt students to assess larger developments across chapters, thus allowing them to develop skills in evaluating change and continuity, making comparisons, and analyzing context and causation.

Within the narrative, a chapter summary reinforces key chapter events and ideas for students. This is followed by the chapter-closing **Connections** feature, which synthesizes main developments and makes connections and comparisons between countries and regions to explain how events relate to larger global processes, such as the influence of the Silk Road, the effects of the transatlantic slave trade, and the ramifications of colonialism. This also serves as a bridge to the subsequent chapters.

Key terms are bolded in the text, defined in the margin, and listed in the “Review and Explore” section to promote clarity and comprehension, and **phonetic spellings** — increased in this edition — are located directly after terms that readers are likely to find hard to pronounce.

The chapter ends with **Suggested Resources**, which includes up-to-date readings on the vast amount of new work being done in many fields, as well as recommended documentaries, feature films, television, and websites.

The high-quality art and map program has been thoroughly revised and features **hundreds of contemporaneous illustrations**. To make the past tangible, and as an extension of our attention to cultural history, we include numerous artifacts — from weapons and armor to dishes, furnishings, and figurines. As in earlier editions, all illustrations have been carefully selected to complement the text, and all include captions that inform students while encouraging them to read the text more deeply. **Numerous high-quality full-size maps** illustrate major developments in the narrative, and helpful spot maps are embedded in the narrative to locate areas under discussion.

In addition, whenever an instructor assigns the **LaunchPad e-Book** (which can be bundled for free with the print book), students get full access to **LearningCurve**, an online adaptive learning tool that promotes mastery of the book's content and diagnoses students' trouble spots. With this adaptive quizzing, students accumulate points toward a target score as they go, giving the interaction a game-like feel. Feedback for incorrect responses explains why the answer is incorrect and directs students back to the text to review before they attempt to answer the question again. The end result is a better understanding of the key elements of the text. Instructors who actively assign LearningCurve report their students come to class prepared for discussion and their students enjoy using it. In addition, LearningCurve's reporting feature allows instructors to quickly diagnose which concepts students in their classes are struggling with so they can adjust lectures and activities accordingly. The LaunchPad e-Book with LearningCurve is thus an invaluable asset for instructors who need to support students in all settings, from traditional lectures to hybrid, online, and newer "flipped" classrooms. In LaunchPad, instructors can also assign the **Guided Reading Exercise** for each chapter, which prompts students to read actively to collect information that answers a broad analytic question central to the chapter as a whole. Through these tools and more, LaunchPad can make the textbook even easier for students to understand and use. To learn more about the benefits of LearningCurve and LaunchPad's other features, see the "Versions and Supplements" section on page x.

All our changes to the book, large and small, are intended to give students and instructors an integrated perspective so that they can pursue — on their own or in the classroom — the historical questions that they find particularly exciting and significant.

Textual Changes

This edition is enhanced by the incorporation of new scholarship and subject areas that immerse students in the dynamic and ongoing work of history. Updates to the eleventh edition include more about Byzantium, Hungary, the Balkans, and the Ottomans (Chapters 14–15); more about technology acquisition and the role of technology in European exploration and more comparisons of Portuguese and Spanish colonization (Chapter 16); more global context for the “little ice age” and more information on the economic and social crises and the popular revolts that occurred in Europe and Asia partly as a result of the climate change (Chapter 18); new coverage on the religious repression of Huguenots under Louis XIII and Cardinal Richelieu (Chapter 18); new material on differences among English, Spanish, and French interactions with indigenous people in the Americas as well as more about the Indians who allied with the French (Chapter 18); reorganized and expanded coverage of the Enlightenment with two new sections covering major thinkers, currents of Enlightenment thought, key debates, global aspects of Enlightenment thought, and the role of women (Chapter 19); new coverage of how colonial contact forged European national identities (Spanish, French, English) as well as “Indian” and “African” identities (Chapter 19); revised coverage of Latin American revolutions with more on the background to the revolutions, the emergence and spread of liberal political ideas, the abolition of slavery, and the events of the revolutions in different parts of Latin America (Chapter 22); new material on the Congress of Vienna and the new “neutral” states of some territories, the neglect of small states, subject peoples, and the question of the future of the European territories of the Ottoman Empire (Chapter 24); revised and expanded coverage of social and economic conflicts that helped spark the 1848 revolutions (Chapter 24); revised discussion of export-led growth in the Americas, giving added focus to social movements (Chapter 27); a sharpened focus on the Cold War as a global phenomenon, enhanced discussion of U.S. intervention in Guatemala and of the Cuban Revolution, enhanced discussion of the Vietnam War as a conflict with global ramifications, and revised treatment of the postwar reconstruction of Japan (Chapter 31); updated discussion of the European Union in the context of the Greek economic crisis, the refugee crisis, and Britain’s vote to exit the European Union (Chapter 32); expanded discussion of China’s emergence as a global economic power and updated treatment of the Arab Spring (Chapter 32); updated and expanded discussion of nuclear proliferation, global health in the context of the Zika outbreak, the role of the Islamic State (ISIS) in the contemporary Middle East, the refugee crisis in Europe, and smartphone use in the developing world (Chapter 33).

Helping Instructors Teach with Digital Resources

As noted, *A History of World Societies* is offered in Macmillan’s premier learning platform, **LaunchPad**, an intuitive and interactive e-Book and course space. Free when packaged with the print book or available at a low price when used on its own, LaunchPad grants students and teachers access to a wealth of online tools and resources built specifically for this text to enhance reading comprehension and promote in-depth study. LaunchPad's course space and interactive e-Book are ready to use as is (or can be edited and customized with your own material) and can be assigned right away.

Developed with extensive feedback from history instructors and students, **LaunchPad for *A History of World Societies*** includes the complete narrative of the print book; the companion reader, *Sources of World Societies*; and **LearningCurve**, an adaptive learning tool designed to get students to read before they come to class. With **an expanded set of source-based questions in the test bank and in LearningCurve**, instructors now have more ways to test students on their understanding of sources and narrative in the book. The addition of the **new Bedford Document Collections modules in LaunchPad** means instructors have a flexible repository of discovery-oriented primary source projects to assign and to extend the text, making LaunchPad for *A History of World Societies* a one-stop shop for working with sources and thinking critically in a multitude of modes.

LaunchPad also offers several other distinctly useful assignment options to help students get the most from their reading, including **Guided Reading Exercises** that prompt students to be active readers of the chapter narrative and autograded **primary source quizzes** to test comprehension of written and visual sources in the book, the companion reader, and the Bedford Document Collections modules. These features, plus **additional primary source documents**, **video sources and tools for making video assignments**, **map activities**, **flashcards**, and **customizable test banks**, make Launchpad a great asset for any instructor who wants to enliven world history for students.

With training and support just a click away, LaunchPad can help you take your teaching into a new era. To learn more about the benefits of LearningCurve and LaunchPad, see "Versions and Supplements" on page x.

Acknowledgments

It is a pleasure to thank the many instructors who critiqued the book in preparation for this revision: Gene Barnett, Calhoun Community College; Amanda Carr-Wilcoxson, Pellissippi State Community College; Ted Cohen, Lindenwood University; Fiona Foster, Tidewater Community College; Paul J. It is also a pleasure to thank the many editors who have assisted us over the years, first at Houghton Mifflin and now at Bedford/St. Martin's (Macmillan Learning). At Bedford/St. Martin's, these include senior development editor Heidi Hood, associate editor Mary Posman Starowicz, program manager Laura Arcari, director of development Jane Knetzger, senior program director Michael Rosenberg, photo researcher Bruce Carson, text permissions editor Eve Lehmann, and senior content project manager Christina Horn, with the guidance of senior managing editor Michael Granger. Other key contributors were designer Cia Boynton, copy editor Jennifer Brett Greenstein, proofreaders Angela Morrison and Susan Zorn, indexer Leoni McVey, and cover designer William Boardman.

Many of our colleagues at the University of Illinois, the University of Washington, the University of Wisconsin–Milwaukee, and Eastern Illinois University continue to provide information and stimulation, often without even knowing it. We thank them for it. The authors recognize John P. McKay, Bennett D. Hill, and John Buckler, the founding authors of this textbook, whose vision set a new standard for world history textbooks. The authors also thank the many students over the years with whom we have used earlier editions of this book. Their reactions and opinions helped shape our revisions to this edition, and we hope it remains worthy of the ultimate praise they bestowed, that it is "not boring like most textbooks." Merry Wiesner-Hanks would, as always, like to thank her husband, Neil, without whom work on this project would not be possible. Patricia Ebrey thanks her husband, Tom. Clare Haru Crowston thanks her husband, Ali, and her children, Lili, Reza, and Kian, who are a joyous reminder of the vitality of life that we try to showcase in this book. Roger Beck thanks Ann for supporting him through five editions now, and for sharing his love of history. He is also grateful to the World History Association for all past, present, and future contributions to his understanding of world history. Jerry Dávila thanks Liv, Ellen, and Alex, who are reminders of why history matters.

Each of us has benefited from the criticism of his or her coauthors, although each of us assumes responsibility for what he or she has written. Merry Wiesner-Hanks has written and revised Chapters 1, 2, 5, 6, 8, 14, and 15; Patricia Buckley Ebrey has written and revised Chapters 3, 4, 7, 9, 12, 13, 17, 21, and 26; Roger B. Beck has written and revised Chapters 10, 20, 25, and 28–30; Clare Haru Crowston has written and revised Chapters 16, 18, 19, and 22–24; and Jerry Dávila has written and revised Chapters 11, 27, and 31–33.

Available for discount purchase on its own or for packaging with new books at no additional charge, LaunchPad is a breakthrough solution for history courses. Intuitive and easy to use for students and instructors alike, LaunchPad is ready to use as is, and can be edited, customized with your own material, and assigned quickly. LaunchPad for *A History of World Societies* includes Bedford/St. Martin's high-quality content all in one place, including the full interactive e-Book and the companion reader *Sources of World Societies*, plus LearningCurve formative quizzing, guided reading activities designed to help students read actively for key concepts, autograded quizzes for each primary source, and chapter summative quizzes. Through a wealth of formative and summative assessments, including the adaptive learning program of LearningCurve (see the full description ahead), students gain confidence and get into their reading before class. Through the Bedford Document Collections for World History (see full description ahead), embedded within LaunchPad, instructors get a flexible repository of discovery-oriented primary source projects ready to assign. These features, plus additional primary source documents, video sources and tools for making video assignments, map activities, flashcards, and customizable test banks, make LaunchPad an invaluable asset for any instructor.

LaunchPad easily integrates with course management systems, and with fast ways to build assignments, rearrange chapters, and add new pages, sections, or links, it lets teachers build the courses they want to teach and hold students accountable. For more information, visit **launchpadworks.com** or to arrange a demo, contact us at **history@macmillan.com**.

Assign LearningCurve So Your Students Come to Class Prepared

Students using LaunchPad receive access to LearningCurve for *A History of World Societies*. Assigning LearningCurve in place of reading quizzes is easy for instructors, and the reporting features help instructors track overall class trends and spot topics that are giving students trouble so they can adjust their lectures and class activities. This online learning tool is popular with students because it was designed to help them rehearse content at their own pace in a nonthreatening, game-like environment. The feedback for wrong answers provides instructional coaching and sends students back to the book for review. Students answer as many questions as necessary to reach a target score, with repeated chances to revisit material they haven't mastered. When LearningCurve is assigned, students come to class better prepared.

iClicker, Active Learning Simplified

iClicker offers simple, flexible tools to help you give students a voice and facilitate active learning in the classroom. Students can participate with the devices they already bring to class using our iClicker Reef mobile apps (which work with smartphones, tablets, or laptops) or iClicker remotes. We've now integrated iClicker with Macmillan's LaunchPad to make it easier than ever to synchronize grades and promote engagement — both in and out of class. iClicker Reef access cards can also be packaged with LaunchPad or your textbook at a significant savings for your students. To learn more, talk to your Macmillan Learning representative or visit us at **www.iclicker.com**.

Take Advantage of Instructor Resources

Bedford/St. Martin's has developed a rich array of teaching resources for this book and for this course. They range from lecture and presentation materials and assessment tools to course management options. Most can be found in LaunchPad or can be downloaded or ordered at **macmillanlearning.com**.

Bedford Coursepack for Blackboard, Canvas, Brightspace by D2L, or Moodle. We can help you integrate our rich content into your course management system. Registered instructors can download coursepacks that include our popular free resources and book-specific content for *A History of World Societies*. Visit **macmillanlearning.com** to find your version or download your coursepack.

Instructor's Resource Manual. The instructor's manual offers both experienced and first-time instructors tools for presenting textbook material in engaging ways. It includes content learning objectives, annotated chapter outlines, and strategies for teaching with the textbook, plus suggestions on how to get the most out of LearningCurve and a survival guide for first-time teaching assistants.

Guide to Changing Editions. Designed to facilitate an instructor's transition from the previous edition of *A History of World Societies* to this new edition, this guide presents an overview of major changes as well as of changes in each chapter.

Online Test Bank. The test bank includes a mix of fresh, carefully crafted multiple-choice, matching, short-answer, and essay questions for each chapter. Many of the multiple-choice questions feature a map, an image, or a primary source excerpt as the prompt. All questions appear in Microsoft Word format and in easy-to-use test bank software that allows instructors to add, edit, resequence, filter by question type or learning objective, and print questions and answers. Instructors can also export questions into a variety of course management systems.

The Bedford Lecture Kit*: Lecture Outlines, Maps, and Images.** Look good and save time with ***The Bedford Lecture Kit. These presentation materials include fully customizable multimedia presentations built around chapter outlines that are embedded with maps, figures, and images from the textbook and are supplemented by more detailed instructor notes on key points and concepts.

NEW *Sources of World Societies*, Third Edition. Designed to accompany *A History of World Societies*, each chapter of this primary source collection contains approximately five written and visual sources that present history from the perspectives of well-known figures and ordinary individuals alike. *Sources of World Societies* provides a broad selection of 165 primary source documents and images as well as editorial apparatuses to help students understand the sources. Each chapter also includes a selection of sources dedicated to varied viewpoints on a specific topic. This companion reader is an exceptional value for students and offers plenty of assignment options for instructors. Available free when packaged with the print text and included in the LaunchPad e-Book with autograded quizzes for each source. Also available on its own as a downloadable e-Book.

NEW The Bedford Document Collections for World History. Found in the

LaunchPad for *A History of World Societies* and available to customize the print text, this collection provides a flexible repository of discovery-oriented primary source projects ready to assign. Each curated project — written by a historian about a favorite topic — poses a historical question and guides students through analysis of the sources. Examples include “The Silk Road: Travel and Trade in Premodern Inner Asia”; “The Spread of Christianity in the Sixteenth and Early Seventeenth Centuries”; “The Singapore Mutiny of 1915: Understanding World War I from a Global Perspective”; and “Living Through Perestroika: The Soviet Union in Upheaval, 1985–1991.” For more information, visit **macmillanlearning.com**.

NEW The Bedford Document Collections for World History Custom Print Modules. Choose one or two document projects from the collection (see above) and add them in print to a Bedford/St. Martin’s title, or select several to be bound together in a custom reader created specifically for your course. Either way, the modules are affordably priced. For more information, contact your Bedford/St. Martin’s representative.

NEW Bedford Tutorials for History. Designed to customize textbooks with resources relevant to individual courses, this collection of brief units, each 16 pages long and loaded with examples, guides students through basic skills such as using historical evidence effectively, working with primary sources, taking effective notes, avoiding plagiarism and citing sources, and more. Up to two tutorials can be added to a Bedford/St. Martin’s history survey title at no additional charge, freeing you to spend your class time focusing on content and interpretation. For more information, visit **macmillanlearning.com/historytutorials**.

The Bedford Series in History and Culture. More than 100 titles in this highly praised series combine first-rate scholarship, historical narrative, and important primary documents for undergraduate courses. Each book is brief, inexpensive, and focused on a specific topic or period. New titles in the series include *Apartheid in South Africa: A Brief History with Documents* by David M. Gordon; *Politics and Society in Japan’s Meiji Restoration: A Brief History with Documents* by Anne Walthall and M. William Steele; and *The Congo Free State and the New Imperialism: A Brief History with Documents* by Kevin Grant. For a complete list of titles, visit **macmillanlearning.com**. Package discounts are available.

Rand McNally Atlas of World History. This collection of almost 70 full-color maps illustrates the eras and civilizations in world history from the emergence of human societies to the present. Free when packaged.

The Bedford Glossary for World History. This handy supplement for the survey course gives students historically contextualized definitions for hundreds of terms — from *abolitionism* to *Zoroastrianism* — that they will encounter in lectures, reading, and exams. Free when packaged.

Trade Books. Titles published by sister companies Hill and Wang; Farrar, Straus and Giroux; Henry Holt and Company; St. Martin's Press; Picador; and Palgrave Macmillan are available at a 50% discount when packaged with Bedford/St. Martin's textbooks. The Earliest Human Societies

to 2500 B.C.E.

National Museum of Art of Romania, Bucharest, Romania/Bridgeman Images

The Thinker of Cernavoda

This small terra-cotta figure, created about 5000 B.C.E. and unearthed at Cernavoda in Romania, is the oldest known sculpture to show human introspection, the distinction that led archaeologists

to give it its name. The figure sits on a low stool, head in hands, in what looks like deep thought or perhaps grief, as it was deposited in a grave beside the body.

When does history begin? Previous generations of historians generally answered that question with “when writing begins.” Thus they started their histories with the earliest-known invention of writing, which happened about 3500–3200 B.C.E. in the Tigris and Euphrates River Valleys of Mesopotamia, in what is now Iraq. Anything before that was “prehistory.” That focus on only the last five thousand years leaves out most of the human story, however, and today historians no longer see writing as such a sharp dividing line. They explore all eras of the human past through many different types of sources, and some push the beginning of history back to the formation of the universe, when time itself began. This very new conceptualization of “big history” is actually similar in scope to the world’s oldest histories, because for thousands and perhaps tens of thousands of years many peoples have narrated histories of their origins that also begin with the creation of the universe.

Exploring the entire human past means beginning in Africa, where millions of years ago humans evolved from a primate ancestor. They migrated out of Africa in several waves, walking along coasts and over land, eventually spreading across much of the earth. Their tools were initially multipurpose sharpened stones and sticks, but gradually they invented more specialized tools that enabled them to obtain food more easily, make clothing, build shelters, and decorate their surroundings. Environmental changes, such as the advance and retreat of the glaciers, shaped life dramatically and may have led to the most significant change in all of human history, the domestication of plants and animals.

Evolution and Migration

How did humans evolve, and where did they migrate?

Studying the earliest era of human history involves methods that seem simple — looking carefully at an object — as well as new high-tech procedures, such as DNA analysis. Through such research, scholars have examined early human evolution, traced the expansion of the human brain, and studied migration out of Africa and across the planet. Combined with spoken language, that larger brain enabled humans to adapt to many different environments and to be flexible in their responses to new challenges.

Understanding the Early Human Past

People throughout the world have developed systems of classification that help them understand things: earth and sky; seen and unseen; animal, vegetable, and mineral; past, present, and future. Among these systems of classification was one invented in eighteenth-century Europe that divided all living things on earth into groups. Each of these divisions — such as that between plants and animals — is further subdivided into smaller and smaller groups, such as class, order, family, and genus. The final important division is the species, which is generally defined as a group of organisms that can interbreed with one another and produce fertile offspring of both sexes.

In their natural state, members of a species resemble one another, but over time they can become increasingly dissimilar. (Think of Chihuahuas and Great Danes, both members of the same species.) Ever since humans began shaping the world around them, this process has often been the result of human action. But in the long era before humans, the increasing dissimilarity resulted, in the opinion of most scientists, from the process of natural selection. Small variations within individuals in one species enabled them to acquire more food and better living conditions and made them more successful in breeding, thus allowing them to pass their genetic material on to the next generation. When a number of individuals within a species became distinct enough that they could no longer interbreed successfully with others, they became a new species. Species also become extinct, particularly during periods of mass extinctions such as the one that killed the dinosaurs about 65 million years ago. Natural processes of species formation and extinction continue, although today changes in the biosphere — the living matter in the world — result far more from human action than from natural selection.

The scientists who developed this system of organizing the world placed humans within it, using the same means of classification that they used for all other living things. Humans were in the animal kingdom, the order of Primates, the family Hominidae, and the genus *Homo*. Like all classifications, this was originally based on externally visible phenomena: humans were placed in the Primates order because, like other primates, they have hands that can grasp, eyes facing forward to allow better depth perception, and relatively large brains; they were placed in the **hominid** (HOM-uh-nid) family along with chimpanzees, gorillas, and orangutans because they shared even more features with these great apes. Over 98 percent of human DNA is the same as that of chimpanzees, which indicates to most scientists that humans and chimpanzees share a common ancestor. That common ancestor probably lived between 5 million and 7 million years ago.

Archaeologists at a Dig These researchers at a Native American site in the Boise National Forest in Idaho follow careful procedures to remove objects from the soil and note their location. The soil itself may also yield clues, such as seeds or pollen, about what was growing in the area, allowing better understanding of the people who once lived at the site.

Physical remains were the earliest type of evidence studied to learn about the distant human past, and scholars used them to develop another system of classification, one that distinguished between periods of time rather than types of living creatures. (Constructing models of time is called “periodization.”) They gave labels to eras according to the primary materials out of which tools that survived were made. Thus the earliest human era became the Stone Age, the next era the Bronze Age, and the next the Iron Age. They further divided the Stone Age into the Old Stone Age, or **Paleolithic era**, the long period that began when hominids first made tools about 2.5 million years ago, during which people used stone, bone, and other natural products to make their tools and gained food largely by **foraging** — that is, by gathering plant products, trapping or catching small animals and birds, and hunting larger prey. This was followed by the New Stone Age, or **Neolithic era**, which saw the beginning of agricultural and animal domestication. People around the world adopted agriculture at various times, and some never did, but the transition between the Paleolithic (pay-lee-oh-LITH-ik) and the Neolithic (nee-oh-LITH-ik) is usually set at about 9000 B.C.E., the point at which agriculture was first developed.[*]

[*] **A note on dates:** This book generally uses **B.C.E.** (Before the Common Era) and **C.E.** (Common Era) when giving dates, a system of chronology based on the Christian calendar and now used widely around the world. Scholars who study the very earliest periods of hominid and human history usually use the phrase “years ago” to date their subjects, as do astrophysicists and geologists; this is often abbreviated as **B.P.** (Before the Present). Because the scale of time covered in Chapter 1 is so vast, a mere two thousand years does not make much difference, and so **B.C.E.** and “years ago” have similar meaning in this chapter.

Paleolithic era Period before 9000 B.C.E. during which humans used tools of stone, bone, and wood and obtained food by gathering and hunting.

foraging A style of life in which people gain food by gathering plant products, trapping or catching small animals and birds, and hunting larger prey.

Neolithic era Period beginning in 9000 B.C.E. during which humans obtained food by raising crops and animals and continued to use tools primarily of stone, bone, and wood.

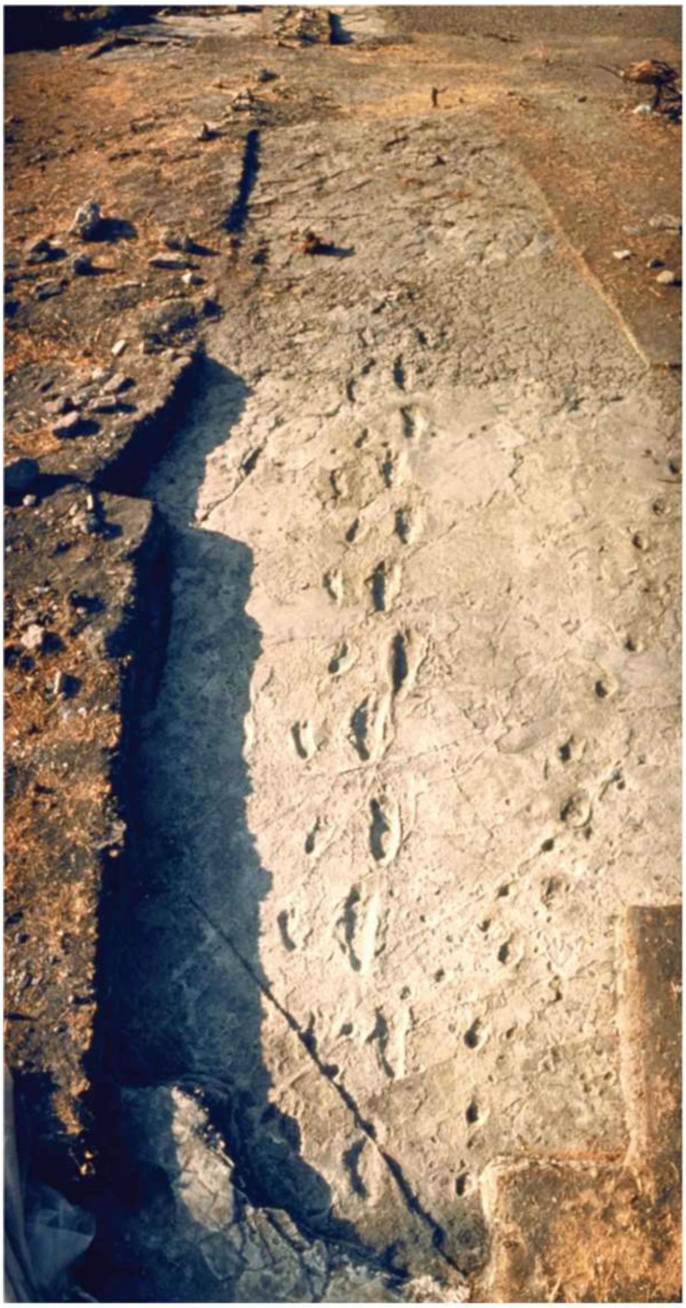
Geologists refer to the last twelve thousand years as the Holocene (meaning very recent) epoch. The entire history of the human species fits well within the Holocene and the previous geologic epoch, the Pleistocene (PLIGH-stuh-seen), which began about 2.5 million years ago.

The Pleistocene was marked by repeated advances in glaciers and continental ice sheets. Glaciers tied up huge quantities of the earth's water, leading to lower sea levels, making it possible for animals and eventually humans to walk between places that were separated by oceans during interglacial times. Animals and humans were also prevented from migrating to other places by the ice sheets themselves, however, and the colder climate made large areas unfit to live in. Climate thus dramatically shaped human cultures.

Hominid Evolution

Using many different pieces of evidence from all over the world, archaeologists, paleontologists, and other scholars have developed a view of human evolution whose basic outline is widely shared, though there are disagreements about details. Most primates, including other hominids such as chimpanzees and gorillas, have lived primarily in trees, but at some point a group of hominids in East Africa began to spend more time on the ground, and between 6 and 7 million years ago they began to walk upright at least some of the time.

Over many generations, the skeletal and muscular structure of some hominids evolved to make upright walking easier, and they gradually became fully bipedal. The earliest fully bipedal hominids, whom paleontologists place in the genus *Australopithecus* (aw-strah-loh-PITH-uh-kuhs), lived in southern and eastern Africa between 2.5 and 4 million years ago. Walking upright allowed australopithecines (aw-strah-loh-PITH-uh-seens) to carry and use things, which allowed them to survive better and may have also spurred brain development.



John Reader/Science Source

Fossil Footprints from Laetoli in Tanzania About 3.5 million years ago, several australopithecines walked in wet ash from a volcanic eruption. Their footprints, discovered by the archaeologist Mary Leakey, indicate that they walked fully upright and suggest that they were not solitary creatures, for they walked close together.

About 3.4 million years ago some hominids began to use naturally occurring objects as tools, and sometime around 2.5 million years ago one group of australopithecines in East Africa began to make and use simple tools, evolving into a different type of hominid that later paleontologists judged to be the first in the genus *Homo*. Called *Homo habilis* (HOH-moh HAB-uh-luhs) ("handy human"), they made sharpened stone pieces, which archaeologists call hand axes, and used them for various tasks. This suggests greater intelligence, and the skeletal remains support this, for *Homo habilis* had a larger brain than did the australopithecines.

About 2 million years ago, another species, called *Homo erectus* (HOH-moh ee-REHK-tuhs) ("upright human"), evolved in East Africa. *Homo erectus* had still larger brains and made tools that were slightly specialized for various tasks, such as handheld axes, cleavers, and scrapers. Archaeological remains indicate that *Homo erectus* lived in larger groups than had earlier hominids and engaged in cooperative gathering, hunting, and food preparation. The location and shape of the larynx suggest that members of this species were able to make a wider range of sounds than were earlier hominids, so they may have relied more on vocal sounds than on gestures to communicate ideas to one another.

The Great Rift Valley

One of the activities that *Homo erectus* carried out most successfully was moving (Map 1.1). Gradually small groups migrated out of East Africa onto the open plains of central Africa, and from there into northern Africa. From 1 million to 2 million years ago, the earth's climate was in a warming phase, and these hominids ranged still farther, moving into western Asia by as early as 1.8 million years ago. Bones and other materials from China and the island of Java in Indonesia indicate that *Homo erectus* had reached there by about 1.5 million years ago, migrating over large landmasses as well as along the coasts. (Sea levels were lower than they are today, and Java could be reached by walking.) *Homo erectus* also walked north, reaching what is now Spain by at least 800,000 years ago and what is now Germany by 500,000 years ago. In each of these places, *Homo erectus* adapted gathering and hunting techniques to the local environment, learning how to find new sources of plant food and how to best catch local animals. Although the climate was warmer than it is today, central Europe was not balmy, and these hominids may have used fire to provide light and heat, cook food, and keep away predators. Many lived in the open or in caves, but some built simple shelters, another indication of increasing flexibility and problem solving.

Mapping the Past

MAP 1.1 Human Migration in the Paleolithic and Neolithic Eras

ANALYZING THE MAP What were the major similarities and differences between the migrations of *Homo erectus* and those of *Homo sapiens*? How did environmental factors shape human migration?

CONNECTIONS What types of technology were required for the migration patterns seen here? What do these migration patterns suggest about the social organization of early people?

Homo Sapiens, "Thinking Humans"

Homo erectus was remarkably adaptable, but another hominid proved still more so: *Homo sapiens* (HOH-moh SAY-pee-enz) ("thinking humans"). A few scientists think that *Homo sapiens* evolved from *Homo erectus* in a number of places in Afroeurasia, but the majority think that, like hominid evolution from earlier primates, this occurred only in East Africa. The evidence is partly archaeological, but also genetic. One type of DNA, called mitochondrial DNA, indicates that modern humans are so similar genetically that they cannot have been evolving for the last 1 million or 2 million years. This evidence suggests that the evolution of *Homo sapiens* has instead taken place for only about 200,000 years. Because there is greater human genetic variety today in Africa than in other parts of the world, the evidence also suggests that *Homo sapiens* have lived there the longest, so that Africa is where they first emerged.

Although there is some debate about where and when *Homo sapiens* emerged, there is little debate about what distinguished these humans from earlier hominids: a bigger brain, in particular a bigger forebrain, the site of conscious thought. The ability to think reflectively allowed for the creation of symbolic language, that is, for language that follows certain rules and that can refer to things or states of being that are not necessarily present. Greater intelligence allowed *Homo sapiens* to better understand and manipulate the world around them, and symbolic language allowed this understanding to be communicated within a group and passed from one generation to the next. Through spoken language *Homo sapiens* began to develop collective explanations for the world around them that we would now call religion, science, and philosophy. Spoken language also enabled *Homo sapiens* to organize socially into larger groups, thus further enhancing their ability to affect the natural world.

The advantages of a larger brain seem evident to us, so we may not think to ask why hominids evolved this way. Large brains also bring disadvantages, however. They take more energy to run than other parts of the body, which means that large-brained animals have to eat more than small-brained ones. Large brains create particular problems for bipedal mammals because the narrow pelvic structure that works best for upright walking makes giving birth to a large-headed infant difficult and painful.

The question of why hominids developed ever-larger brains might best be answered by looking at how paleontologists think it happened. As *Homo habilis*, *Homo erectus*, and *Homo sapiens* made and used tools, the individuals whose mental and physical abilities allowed them to do so best were able to obtain more food and were more likely to mate and have children who survived. Thus bigger brains led to better tools, but the challenges of using and inventing better tools also created selective pressure that led to bigger brains.

The same thing may have happened with symbolic language and thought. A slightly bigger brain allowed for more complex thought and better language skills. These thinking and speaking skills enabled individuals to better attract mates and fend off rivals, which meant a greater likelihood of passing on the enhanced brain to the next generation. As we know from contemporary research on the brain, learning language promotes the development of specific areas of the brain.

The growth in brain size and complexity may also have been linked to social organization. Individuals who had better social skills were more likely to mate than those who did not — this has been observed in chimpanzees and, of course, in modern humans — and thus to pass on their genetic material. Social skills were particularly important for females because the combination of bipedalism and growing brain size led to selective pressure for hominid infants to be born at an even earlier stage in their development than other primate infants were. Thus the period when human infants are dependent on others is very long, and mothers with good social networks to assist them were more likely to have infants who survived. Humans are unique in the duration and complexity of their care for children. Cooperative child rearing, along with the development of social skills and the adaptability this encouraged, may have been an impetus to brain growth.

All these factors operated together in processes that promoted bigger and better brains. In the Paleolithic period, *Homo sapiens*' brains invented highly specialized tools made out of a variety of materials that replaced the more general-purpose stone tools made by *Homo erectus*: barbed fishhooks and harpoons, snares and traps for catching small animals, bone needles for sewing clothing, awls for punching holes in leather, nets for catching fish, sharpened flint pieces bound to wooden or bone handles for hunting or cutting, and slings for carrying infants. By 25,000 years ago, and perhaps earlier, humans in some parts of the world were weaving cloth, nets, and baskets out of bark, rushes, grasses, and other natural materials, and by 17,000 years ago they were using bows and atlatls (AHT-lah-tuhlz) — notched throwing sticks made of bone, wood, or antler — to launch arrows and barbs with flint points bound to wooden shafts. The archaeological evidence for increasingly sophisticated language and social organization is less direct than that for tool use, but it is hard to imagine how humans could have made the tools they did — or would have chosen to decorate so many of them — without both of these.

Migration and Differentiation

Like *Homo erectus* had earlier, groups of *Homo sapiens* moved. By 200,000 years ago they had begun to spread across Africa, and by 120,000 years ago they had begun to migrate out of Africa to Eurasia (see Map

1.1). They most likely walked along the coasts of India and Southeast Asia, and then migrated inland. At the same time, further small evolutionary changes led to our own subspecies of anatomically modern humans, *Homo sapiens sapiens* (which literally translates as "thinking thinking humans"). *Homo sapiens sapiens* moved into areas where there were already *Homo erectus* populations, eventually replacing them and leaving *Homo sapiens* as the only survivors and the ancestors of all modern humans.

The best-known example of interaction between *Homo erectus* and *Homo sapiens sapiens* is that between Neanderthals (named after the Neander Valley in Germany, where their remains were first discovered) and a group of anatomically modern humans called Cro-Magnons. **Neanderthals** (nee-AHN-der-tals) lived throughout Europe and western Asia beginning about 200,000 years ago, had brains as large as those of modern humans, and used tools, including spears and scrapers for animal skins, that enabled them to survive in the cold climate of Ice Age central Europe and Russia. They built freestanding houses and decorated objects and themselves with red ochre, a form of colored clay. They sometimes buried their dead carefully with tools, animal bones, and perhaps flowers, which suggests that they understood death to have a symbolic meaning.

Neanderthals Group of *Homo erectus* with brains as large as those of modern humans that lived in Europe and western Asia between 200,000 and 30,000 years ago.

Cro-Magnon peoples had moved into parts of western Asia where Neanderthals lived by about 70,000 years ago, and into Europe by about 45,000 years ago. The two peoples appear to have lived side by side for millennia, hunting the same types of animals and gathering the same types of plants. The last evidence of Neanderthals as a separate species comes from about 30,000 years ago, and it is not clear exactly how they died out. They may have been killed by Cro-Magnon peoples, or they simply may have lost the competition for food as the climate worsened around 30,000 years ago and the glaciers expanded.

Homo erectus migrated great distances, but *Homo sapiens sapiens* made use of greater intelligence and better toolmaking capabilities to migrate still farther. They had used simple rafts to reach Australia by at least 50,000 years ago, and by 35,000 years ago had reached New Guinea. By at least 15,000 years ago, humans had walked across the land bridges then linking Siberia and North America at the Bering Strait and had crossed into the Americas. Because by 14,000 years ago humans were already in southern South America, ten thousand miles from the land bridges, many scholars now think that people came to the Americas much earlier. They think humans came from Asia to the Americas perhaps as early as 20,000 or even 30,000 years ago, walking or using rafts along the coasts. (See Chapter 11 for a longer discussion of this issue.)

Land Bridge Across the Bering Strait, ca. 15,000 B.C.E.

With the melting of glaciers sea levels rose, and parts of the world that had been linked by land bridges, including North America and Asia as well as many parts of Southeast Asia, became separated by water. This cut off migratory paths but also spurred innovation. Humans designed and built ever more sophisticated boats and learned how to navigate by studying wind and current patterns, bird flights, and the position of the stars. They sailed to increasingly remote islands, including those in the Pacific, the last parts of the globe to be settled. The western Pacific islands were inhabited by about 2000 B.C.E., Hawaii by about 500 C.E., and New Zealand by about 1000 C.E. (For more on the settlement of the Pacific islands, see "The Settlement of the Pacific Islands" in Chapter 12.)

Polynesian Oceangoing Sailing Canoe This is a Hawaiian replica of the type of large double-hulled canoe in which Polynesians sailed around the Pacific as they settled many different island groups. This canoe, called the Hokule'a, has taken many voyages using traditional Pacific techniques of celestial navigation. The two hulls provided greater stability, and canoes designed like this sailed thousands of miles over the open ocean.

Once humans had spread out over much of the globe, groups often became isolated from one another, and people mated only with other members of their own group or those who lived nearby, a practice anthropologists call **endogamy**. Thus, over thousands of generations, although humans remained one species, *Homo sapiens sapiens* came to develop differences in physical features, including skin and hair color, eye and body shape, and amount of body hair. Language also changed over generations, so that thousands of different languages were eventually spoken. Groups created widely varying cultures and passed them on to their children, further increasing diversity among humans.

endogamy The practice of marrying within a certain ethnic or social group.

Beginning in the eighteenth century, European natural scientists sought to develop a system that would explain human differences at the largest scale. They divided people into very large groups by skin color and other physical characteristics and termed these groups “races,” a word that had originally meant lineage. They first differentiated these races by continent of origin — Americanus, Europaeus, Asiaticus, and Africanus — and then by somewhat different geographic areas. The word *Caucasian* was first used by the German anatomist and naturalist Johann Friedrich Blumenbach (1752–1840) to describe light-skinned people of Europe and western Asia because he thought that their original home was most likely the Caucasus Mountains on the border between Russia and Georgia. He thought that they were the first humans and the most attractive. This meaning of *race* has had a long life, though biologists and anthropologists today do not use it, as it has no scientific meaning or explanatory value. All humans are one species with less genetic variety than chimpanzees.

Later Paleolithic Society, ca. 200,000–9000 B.C.E.

What were the key features of Paleolithic society?

Eventually human cultures became widely diverse, but in the Paleolithic period people throughout the world lived in ways that were similar to one another. Archaeological evidence and studies of modern foragers suggest that people lived in small groups of related individuals and moved throughout the landscape in search of food. Most had few material possessions, only what they could carry, although in areas where food resources were especially rich, such as along seacoasts, they built structures and lived more permanently in one place. In the later Paleolithic, people in many parts of the world created art and music and developed religious ideas that linked the natural world to a world beyond.

Foraging for Food

Paleolithic peoples have often been called hunter-gatherers, but recent archaeological and anthropological research indicates that both historical and contemporary hunter-gatherers have depended much more on gathered foods than on hunted meat. Thus most scholars now call them foragers, a term that highlights the flexibility and adaptability in their search for food. Most of the foods foragers ate were plants, and much of the animal protein in their diet came from foods gathered or scavenged rather than hunted directly: insects, shellfish, small animals caught in traps, fish and other sea creatures caught in weirs and nets, and animals killed by other predators.

Paleolithic Hand Axes Like most Paleolithic stone tools, these two hand axes from Libya in northern Africa were made by chipping flakes off stone to form a sharpened edge. Although they are traditionally called axes, they were used for a variety of purposes, including skinning, cutting, and chopping.

Paleolithic peoples did hunt large game. Groups working together forced animals over cliffs, threw spears, and, beginning about 15,000 B.C.E., used bows and atlatls to shoot projectiles so that they could stand farther away from their prey while hunting. The final retreat of the glaciers also occurred between about 13,000 and 8000 B.C.E., and the warming climate was less favorable to the very large mammals that had roamed the open spaces of many parts of the world. Wooly mammoths, mastodons, and wooly rhinos all died out in Eurasia in this **megafaunal extinction**, as did camels, horses, and sloths in the Americas and giant kangaroos and wombats in Australia. In many places, these extinctions occurred just about the time that modern humans migrated into an area, and increasing numbers of scientists think that they were at least in part caused by human hunting, as many types of large animals vanished in Australia about 45,000 B.C.E., shortly after humans arrived, long before the final climate warming.

megafaunal extinction Die-off of large animals in many parts of the world, 45,000–10,000 B.C.E., caused by climate change and most likely human hunting.

Most foraging societies that exist today, or did so until recently, have some type of **division of labor** by sex, and also by age, with children and older people responsible for different tasks than adult men and women are. Men are more often responsible for hunting and women for gathering plant and animal products. This has led scholars to assume that in Paleolithic society men were also responsible for hunting, and women for gathering, although this may not have been the case. The stone and bone tools that remain from the Paleolithic period give no clear evidence of who used them, and the division of labor may have been somewhat flexible, particularly during periods of scarcity.

division of labor Differentiation of tasks by gender, age, training, status, or other social distinction.

Obtaining food was a constant preoccupation, but it was not a constant job. Studies of recent foragers indicate that, other than in times of environmental disasters such as prolonged droughts, people need only about ten to twenty hours a week to gather food and carry out the other tasks needed to survive, such as locating water and building shelters. Moreover, the diet of foragers is varied and nutritious; it is low in fat and salt, high in fiber, and rich in vitamins and minerals. The slow pace of life and healthy diet did not mean that Paleolithic life spans approached those of the modern world, however. People avoided such contemporary killers as heart disease and diabetes, but they often died at young ages from injuries, infections, animal attacks, and interpersonal violence. Mothers and infants died in childbirth, and many children died before they reached adulthood.

Total human population thus grew very slowly during the Paleolithic, from perhaps half a million humans in the world about 30,000 years ago to about 5 million 10,000 years ago. Moreover, the population was widely scattered, with small bands of people occupying very large territories. The low population density meant that human impact on the environment was relatively small, although still significant. In addition to contributing to the extinction of some large animals, Paleolithic people may have also shaped their environments by setting fires, which encouraged the growth of new plants and attracted animals that fed on them, making hunting or snaring game easier. This practice was a factor in the spread of plants that thrived best with occasional burning, such as the eucalyptus in Australia.

Family and Kinship Relationships

Small bands of humans — twenty or thirty people was a standard size for foragers in harsh environments — were scattered across broad areas, but this did not mean that each group lived in isolation. Their travels in search of food brought them into contact with one another, not simply for talking and celebrating, but also for providing opportunities for the exchange of sexual partners, which was essential to group survival. Mating arrangements varied in their permanence, but many groups seem to have developed a somewhat permanent arrangement whereby a man or woman left his or her original group and joined the group of his or her mate, what would later be termed marriage.

Within each band, and within the larger kin groups, individuals had a variety of identities; they were simultaneously fathers, sons, husbands, and brothers, or mothers, daughters, wives, and sisters. Each of these identities was relational (parent to child, sibling to sibling, spouse to spouse), and some of them, especially parent to child, gave one power over others. Paleolithic people were not differentiated by wealth, for in a foraging society accumulating material goods was not advantageous. But they were differentiated by such factors as age, gender, and position in a family, and no doubt by personal qualities such as intelligence, courage, and charisma.

Stereotypical representations of Paleolithic people often portray men going off to hunt while women and children crouched around a fire, waiting for the men to bring back meat. Studies of the relative importance of gathering to hunting, women’s participation in hunting, and gender relations among contemporary foraging peoples have led some analysts to turn these stereotypes on their heads. They see Paleolithic bands as egalitarian groups in which the contributions of men and women to survival were recognized and valued, and in which both men and women had equal access to the limited amount of resources held by the group. Other scholars argue that this is also a stereotype, overly romanticizing Paleolithic society. They note that, although social relations among foragers were not as hierarchical as they were in other types of societies, many foraging groups had one person who held more power than others, and that person was almost always a man. This debate about gender relations is often part of larger discussions about whether Paleolithic society — and by implication, “human nature” — was primarily peaceful and nurturing or violent and brutal, and whether these qualities are gender related. Like much else about the Paleolithic, sources about gender and about violence are fragmentary and difficult to interpret; there may simply have been a diversity of patterns, as there is among more modern foragers. (See “Analyzing the Evidence: Paleolithic Venus Figures,” page 12.)

Whether peaceful and egalitarian or violent and hierarchical, heterosexual relations produced children, who were cared for as infants by their mothers or other women who had recently given birth. Breast milk was the only food available that infants could easily digest, so mothers nursed their children for several years. Along with providing food for infants, extended nursing brings a side benefit: it suppresses ovulation and thus acts as a contraceptive. Foraging groups needed children to survive, but too many could tax scarce food resources. Other than for feeding, children were most likely cared for by other male and female members of the group as well as by their mothers during the long period of human childhood.

ANALYZING THE EVIDENCE

Paleolithic Venus Figures

Written sources provide evidence about the human past only after the development of writing, allowing us to listen to the voices of people long dead. For most of human history, however, there were no written sources, so we “listen” to the past through objects. Interpreting written documents is difficult, and interpreting archaeological evidence about the earliest human belief systems is even more difficult and often contentious. For example, small stone statues of women with enlarged breasts and buttocks dating from the later Paleolithic period (roughly 33,000–9000 B.C.E.) have been found in many parts of Europe. These were dubbed “Venus figures” by nineteenth-century archaeologists, who thought they represented Paleolithic standards of female beauty just as the goddess Venus represented classical standards. A reproduction of one of these statues, the 6-inch-tall Venus of Lespugue made from a mammoth tusk about 25,000 years ago in southern France, is shown here. Venus figures provoke more questions than answers: Are they fertility goddesses, evidence of people’s beliefs in a powerful female deity? Or are they aids to fertility, carried around by women hoping to have children — or perhaps hoping not to have more — and then discarded in the household debris where they have been most commonly found? Or are they sexualized images of women carried around by men, a sort of Paleolithic version of the centerfold in a men’s magazine? Might they have represented different things to different people? Like so much Paleolithic evidence, Venus figurines provide tantalizing evidence about early human cultures, but evidence that is not easy to interpret.

QUESTIONS FOR ANALYSIS

1. As you look at this statue, does it seem to link more closely with fertility or with sexuality? How might your own situation as a twenty-first-century person shape your answer to this question?
2. Some scholars see Venus figures as evidence that Paleolithic society was egalitarian or female dominated, but others point out that images of female deities or holy figures are often found in religions that deny women official authority. Can you think of examples of the latter? Which point of view seems most persuasive to you?

Cultural Creations and Spirituality

Beginning in the Paleolithic, human beings expressed themselves through what we would now term the arts or culture: painting and decorating walls and objects, making music with their voices and a variety of instruments, imagining and telling stories, dancing alone or in groups. Evidence from the Paleolithic, particularly from after about 50,000 years ago, includes flutes, carvings, jewelry, and paintings done on cave walls and rock outcroppings that depict animals, people, and symbols. In many places these paintings also show the outline of a human hand — often done by blowing pigment around it — or tracings of the fingers. (See “Thinking Like a Historian: Paleolithic Hand Markings,” page 14.)

At the same time that people marked and depicted the world around them, they also appear to have developed ideas about supernatural forces that controlled some aspects of the natural world and the place of humans in it, what we now term spirituality or religion. Paleolithic burials, paintings, and objects suggest that people may have thought of their world as extending beyond the visible. People, animals, plants, natural occurrences, and other things around them had spirits, an idea called **animism**. The only evidence of Paleolithic animism that survives is physical, of course, but more recent animist traditions carry on this understanding of the spiritual nature and interdependence of all things.

animism Idea that people, animals, plants, natural occurrences, and other parts of the physical world have spirits.

Death took people from the realm of the living, but for Paleolithic groups people continued to inhabit an unseen world, along with spirits and deities, after death; thus kin groups included deceased as well as living members of a family. The unseen world regularly intervened in the visible world, for good and ill, and the actions of dead ancestors, spirits, and gods could be shaped by living people. Concepts of the supernatural pervaded all aspects of life; hunting, birth, death, and natural occurrences such as eclipses, comets, and rainbows all had religious meaning. Supernatural forces were understood to determine the basic rules for human existence, and upsetting these rules could lead to chaos.

Ordinary people learned about the unseen world through dreams and portents, and messages and revelations were also sent more regularly to **shamans**, spiritually adept men and women who communicated with the unseen world. Shamans created complex rituals through which they sought to ensure the health and prosperity of an individual, family, or group. Many cave paintings show herds of prey animals, and several include a masked human figure usually judged to be a shaman performing some sort of ritual. (See “Analyzing the Evidence: Bison and Human in Lascaux Cave,” page 16.) Objects understood to have special power, such as carvings or masks in the form of an animal or person, could give additional protection, as could certain plants or mixtures eaten, sniffed, or rubbed on the skin. Shamans thus also operated as healers, with cures that included what we would term natural medicines and religious healing.

THINKING LIKE A HISTORIAN

Paleolithic Hand Markings

Paleolithic finger and hand markings have been found all over the world and were created in a variety of ways — running fingers over wet or soft stone, dipping a hand in pigment and pressing it onto a surface, or tracing or blowing pigment around a hand. Many were made with red ochre, a naturally occurring mixture of clay and iron oxide that humans have been using for various purposes for more than a hundred thousand years. The oldest have been dated to about 40,000 B.C.E., though most are difficult to date exactly. Why, in your opinion, was the human hand such a common image in Paleolithic art?

1 **Hand stencils from the Kimberley region in Western Australia, ca. 15,000–10,000 B.C.E.** Paintings from 15,000–10,000 B.C.E. in the Kimberley region in Australia include stencils of hands, feet, and boomerangs, and life-size paintings of animals and fish. This painting, made from red ochre, includes several adult hands with amputated fingers and thumbs, which were not uncommon in hand stencils from many parts of the world.

2 **Finger marks from Rouffignac Cave in France, 18,000–9000 B.C.E.** The finger marks of a young child, most likely a girl, along with those of adults, were made in the wet surfaces of the cave, far from the entrance, indicating that the creators would have

used torches as they decorated the walls and ceiling. The child ran the three middle fingers of each hand down the wall at the same time, which meant someone else was holding the torch so the child could see.

3 **Handprints from Cueva de las Manos (Cave of the Hands) in Argentina, ca. 8000 B.C.E.** These handprints, made by blowing red ochre paint around the hand through a bone pipe, are from different individuals. All are slightly smaller than adult hands, so were most likely made by adolescents. Most are left hands, which indicates that even in the Paleolithic, most people were right-handed, since they would have held the pipe for blowing in the hand they normally used for tasks.

4 **Handprints from Wadi el-Obeiyd in Egypt, ca. 8000–4000 B.C.E.** Caves near oases in the western deserts of Egypt contain many examples of rock art, including handprints, animals, boats, and symbols. The upper handprint here is surrounded by white circles and, further out, a honeycomb grid pattern. As with many symbols and designs in rock art, the meaning of these is not known.

ANALYZING THE EVIDENCE

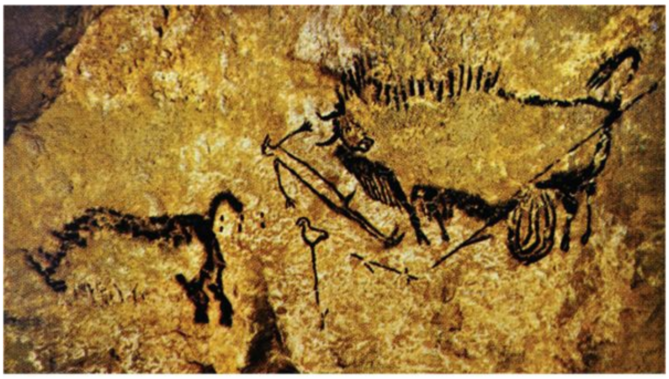
1. Source 1 shows a group of adult hands, some with amputated fingers or thumbs. What possibile reasons can you think of for an amputation? What do each of the possibilities suggest about Paleolithic society?
2. The finger marks in Source 2 were made by a group of people of various ages and, like most cave paintings, are far from the entrance to the cave. What does this suggest about the role of children in Paleolithic society?
3. The handprints in Source 3 were all made by adolescents at the same time in some type of group activity. What might have occasioned this? How and why do adolescents today mark spaces as their own?
4. What might the white circles in Source 4 symbolize? Why do you think artists frequently included symbols along with hands?
5. Along with the fact that red ochre was such a common substance, can you think of other reasons why people might have favored it for the depiction of human hands?

PUTTING IT ALL TOGETHER

Using the sources above, along with what you have learned in class and in this chapter, write a short essay that analyzes why the human hand was such a common image in Paleolithic rock art. What are various reasons people might have wanted to indicate “I was here” or “we were here,” creating a record of their presence? What does the fact that figurative rock art developed independently in many places suggest about technological inventiveness and symbolic thinking?

ANALYZING THE EVIDENCE

Bison and Human in Lascaux Cave



Universal History Archive/UIG via Getty Images

The interconnected series of caves in the Lascaux region of southwestern France has paintings (dating from about 15,000 B.C.E.) of nearly two thousand figures on its walls, including animals that would have been hunted and eaten, such as deer, bulls, bison, and horses, and those that would have been feared as predators, such as lions, other big cats, and bears, as well as geometric and abstract designs. Most of the paintings, made with colored minerals on surfaces smoothed by the artist, are located far from the cave entrance and are not easily accessible, suggesting they were made for ceremonial or ritual purposes, not as decorations for living spaces. Amid the amazing animals is a depiction, painted near the bottom of a 20-foot shaft in a remote part of the cave, of a human next to a bison spilling its guts out onto the ground. Scholars first interpreted this enigmatic scene as a hunting accident but more recently have proposed that the human is a shaman with a bird mask and a bird-head staff in a state of trance, as his body and limbs are rigid. The figure has what looks like a penis, and is usually described as a man, although some anthropologists have suggested it could have been a woman wearing an artificial penis along with a mask, as gender inversions were often part of rituals and performances. Thus the person may have been biologically female but culturally understood to be male in this ritual. Or the figure — and the actual shaman whom it may have represented — could have been understood as a third gender, neither male nor female, or both at the same time, just as the shaman may have been thought to take on the qualities of the bird represented by the mask but still remain human. Shamans regarded as a third gender could be found in the more recent past than the Paleolithic in many parts of the world, including various regions of Asia, North and South America, and Australia.

QUESTIONS FOR ANALYSIS

1. Shamans in Paleolithic and more recent societies were understood to harness power that crossed various types of boundaries, including those between the seen and unseen worlds, life and death, animal and human, and sometimes male and female. Why might this be advantageous in hunting rituals or other types of ceremonies? If the person depicted here is a shaman, what boundaries might the shaman depicted here be seen as crossing?
2. Why might Paleolithic people have made cave paintings? What do these paintings

suggest about Old Stone Age culture and society?

The Development of Agriculture in the Neolithic Era, ca. 9000 B.C.E.

How did plant and animal domestication develop, and what effects did it have on human society?

Foraging remained the basic way of life for most of human history. In a few especially fertile areas, however, the natural environment provided enough food that people could become more settled. As they remained in one place, they began to plant seeds as well as gather wild crops, to raise certain animals instead of hunting them, and to selectively breed both plants and animals to make them more useful to humans. This seemingly small alteration was the most important change in human history; because of its impact it is often termed the **Agricultural Revolution**. Plant and animal domestication marked the transition from the Paleolithic to the Neolithic. It allowed the human population to grow far more quickly than did foraging, but it also required more labor, which became increasingly specialized.

Agricultural Revolution Dramatic transformation in human history resulting from the change from foraging to raising crops and animals.

The Development of Horticulture

Areas of the world differed in the food resources available to foragers. In some, acquiring enough food to sustain a group was difficult, and groups had to move constantly. In others, moderate temperatures and abundant rainfall allowed for verdant plant growth; or seas, rivers, and lakes provided substantial amounts of fish and shellfish. Groups in such areas were able to become more settled. About 15,000 years ago, the earth’s climate entered a warming phase, and the glaciers began to retreat. As the earth became warmer, the climate became wetter, and more parts of the world were able to support sedentary or semi-sedentary groups of foragers.

In several of these places, foragers began planting seeds in the ground along with gathering wild grains, roots, and other foodstuffs. By observation, they learned the optimum times and places for planting. They removed unwanted plants through weeding and selected the seeds they planted in order to get crops that had favorable characteristics, such as larger edible parts. Through this human intervention, certain crops became

domesticated, that is, modified by selective breeding so as to serve human needs, in this case to provide a more reliable source of food. Archaeologists trace the development and spread of plant raising by noting when the seeds and other plant parts they discover show evidence of domestication.

Grinding Stones from a Neolithic Village in Jordan, occupied 7200–6500 B.C.E. Paleolithic people used stone tools to crush and grind ochre, nuts, grains, and other materials, but as crops were domesticated in the Neolithic, grinding stones such as these from Jordan in the Fertile Crescent became even more common. Grinding maximizes the amount of digestible food and caloric content derived from grain, providing important nutritional benefits as increasingly sedentary populations relied on limited areas of cultivation for most of their food. Wear patterns in women's wrist bones indicate that hand grinding was often a woman's task, a gender division of labor that continued for millennia in many parts of the world.

domesticated Plants and animals modified by selective breeding so as to serve human needs; domesticated animals will behave in specific ways and breed in captivity.

This early crop planting was done by individuals using hoes and digging sticks, and it is often termed **horticulture** to distinguish it from the later agriculture using plows. Intentional crop planting developed first in the part of southwest Asia archaeologists call the Fertile Crescent, which runs from present-day Lebanon, Israel, and Jordan north to Turkey and then south along the Tigris and Euphrates Rivers to the Iran-Iraq border (Map 1.2). About 9000 B.C.E. people there began to plant seeds of the wild wheat and barley they had already been harvesting, along with seeds of legume crops, such as peas and lentils, and of the flax with which they made linen cloth. By about 8000 B.C.E. people were growing sorghum and millet in parts of the Nile River Valley, and perhaps yams in western Africa. By about 7000 B.C.E. they were growing domesticated rice, millet, and legumes in China; yams and taro in Papua New Guinea; and perhaps squash in Mesoamerica. In each of these places, the development of horticulture occurred independently, and it may have happened in other parts of the world as well.

MAP 1.2 The Spread of Agriculture and Pastoralism Local plants and animals were domesticated in many different places. Agriculturalists and pastoralists spread the knowledge of how to raise them, and spread the plants and animals themselves through migration, trade, and conquest.

Nowhere do archaeological remains alone answer the question of who within any group first began to cultivate crops, but the fact that, among foragers, women were primarily responsible for gathering plant products suggests that they may also have been the first to plant seeds in the ground. In many parts of the world, crops continued to be planted with hoes and digging sticks for millennia, and crop raising remained primarily women's work, while men hunted or later raised animals.

Why, after living successfully as foragers for tens of thousands of years, did humans in so many parts of the world all begin raising crops at about the same time? The answer to this question is not clear, but crop raising may have resulted from population pressures in those parts of the world where the warming climate provided more food. More food meant lower child mortality and longer life spans, which allowed communities to grow. When population growth outstripped the local food supply, people had a choice: they could move to a new area — the solution that foragers had relied on when faced with the problem of food scarcity — or they could develop ways to increase the food supply to keep up with population growth, a solution that the warming climate was making possible. They chose the latter and began to plant more intensively, beginning cycles of expanding population and intensification of land use that have continued to today.

A recent archaeological find at Göbekli Tepe (gyeh-BEHK-lee TEH-peh) in present-day Turkey, at the northern edge of the Fertile Crescent, suggests that cultural factors may have played a role in the development of agriculture. Here, around 9000 B.C.E. hundreds of people came together to build rings of massive, multi-ton, elaborately carved limestone pillars and then covered them with dirt and built more. The people who created this site lived some distance away, where archaeological evidence indicates they first carved the pillars. The evidence also reveals that they ate wild game and plants, not crops. The project may have unintentionally spurred the development of new methods of food production that would allow the many workers to be fed efficiently. Indeed, it is very near here that evidence of the world's oldest domesticated wheat has been discovered. Archaeologists speculate that the symbolic, cultural, or perhaps religious importance of the structure can help explain why the people building it changed from foraging to agriculture.

Pillar at Göbekli Tepe The huge limestone pillars arranged in rings at the Paleolithic site Göbekli Tepe are somewhat humanoid in shape, and the carvings are of dangerous animals, including lions, boars, foxes, snakes, vultures, and scorpions. The structure required enormous skill and effort of the people who built it, and clearly had great importance to them.

Whatever the reasons for the move from foraging to crop raising, within several centuries of initial crop planting, people in the Fertile Crescent, parts of China, and the Nile Valley were relying on domesticated food products alone. They built permanent houses near one another in villages surrounded by fields, and they invented new ways of storing foods, such as in pottery made from clay. (See “Global Viewpoints: Stone Age Houses in Chile and China,” page 20.) Villages were closer together than were the camps of foragers, so population density as well as total population grew.

A field of planted and weeded crops yields ten to one hundred times as much food — measured in calories — as the same area of naturally occurring plants. It also requires much more labor, however, which was provided both by the greater number of people in the community and by the longer hours those people worked. Farming peoples were often in the fields from dawn to dusk. Early farmers were also less healthy than foragers were. Their narrower range of foodstuffs made them more susceptible to disease and nutritional deficiencies such as anemia.

Foragers who lived at the edge of horticultural communities appear to have recognized the negative aspects of crop raising, for they did not immediately adopt this new way of life. Instead farming spread when a village became too large and some residents moved to a new area. Because the population of farming communities grew so much faster than that of foragers, however, horticulture quickly spread into fertile areas. By about 6500 B.C.E. farming had spread northward from the Fertile Crescent into Greece, and by 4000 B.C.E. farther northward all the way to Britain; by 4500 B.C.E. it had spread southward into Ethiopia. At the same time, crop raising spread out from other areas in which it was first developed, and slowly larger and larger parts of China, South and Southeast Asia, and East Africa became home to horticultural villages.

People adapted crops to their local environments, choosing seeds that had qualities that were beneficial, such as drought resistance. They also domesticated new kinds of crops. In the Americas, for example, by about 3000 B.C.E. corn was domesticated in southern Mexico and potatoes and quinoa in the Andes region of South America, and by about 2500 B.C.E. squash and beans in eastern North America. These crops then spread, so that by about 1000 B.C.E. people in much of what is now the western United States were raising corn, beans, and squash. In the Indus Valley of South Asia, people were growing dates, mangoes, sesame seeds, and cotton along with grains and legumes by 4000 B.C.E. Accordingly, crop raising led to dramatic human alteration of the environment.

Certain planted crops eventually came to be grown over huge areas of land, so that some scientists describe the Agricultural Revolution as a revolution of codependent domestication: humans domesticated crops, but crops also “domesticated” humans so that they worked long hours spreading particular crops around the world. Of these, corn has probably been the most successful; more than half a million square miles around the world are now planted in corn.

In some parts of the world horticulture led to a dramatic change in the way of life, but in others it did not. Horticulture can be easily combined with gathering and hunting, as plots of land are usually small; many cultures, including some in Papua New Guinea and North America, remained mixed foragers and horticulturists for thousands of years. Especially in deeply wooded areas, people cleared small plots by chopping and burning the natural vegetation, and planted crops in successive years until the soil eroded or lost its fertility, a method termed “slash and burn.” They then moved to another area and began the process again, perhaps returning to the first plot many years later, after the soil had rejuvenated itself. Groups using shifting slash-and-burn cultivation remained small and continued to rely on the surrounding forest for much of their food.

Monte Verde, Chile, ca. 12,000 B.C.E.

One of the central issues facing most human groups has been shelter from the elements. People’s varying solutions to this issue reflect the environmental challenges and opportunities offered by their particular surroundings. Not only are houses physical structures, however, but they also reflect, communicate, and shape cultural and social values. The photographs on this page show the remains of houses built during the Paleolithic and Neolithic periods in two parts of the world very far from one another.

Monte Verde in Chile dates from about 12,000 B.C.E. The archaeologists who have studied this site have concluded that here, along a creek, a small group of perhaps twenty to thirty people built a 20-foot-long structure of wooden poles covered by animal skins. Within the structure were smaller living quarters separated by skins, each with its own small fire pit, around which archaeologists have found stone tools, rope made of reeds, and many different types of foraged food, including wild potatoes and seaweed that came from coastal areas far away.

The village of Banpo near Xi’an in China dates from about 4500 B.C.E. Archaeologists have concluded that a group of several hundred people built fifty or so houses there, along with kilns for making pottery and cellars for storage. They built each house by digging a shallow hole as a foundation, surrounding this with walls made of stakes interwoven with branches and twigs, and plastering this with mud, which dried to become wind and water resistant. They formed the roof out of thatch made from millet and rice stalks, grains they raised that formed the main part of their diet.

QUESTIONS FOR ANALYSIS

1. From the photographs and the descriptions, what similarities and differences do you see in the two types of houses?
2. Monte Verde was a Paleolithic community of foragers, and Banpo a Neolithic community of agriculturalists. How might the differences between the two houses have been shaped by the technology of food production? What other factors might account for the differences?
3. It is easy to see the vast differences between these houses and those of today, but what similarities do you find? What social and cultural values might lie behind these similarities?

Animal Domestication and the Rise of Pastoralism

At roughly the same time that they domesticated certain plants, people also domesticated animals. The earliest animal to be domesticated was the dog, which separated genetically as a subspecies from wolves at least 15,000 years ago and perhaps much earlier. The relationship provided both humans and dogs with benefits: humans gained dogs' better senses of smell and hearing and their body warmth, and dogs gained new food sources and safer surroundings. Not surprisingly, humans and domestic dogs migrated together, including across the land bridges to the Americas and on boats to Pacific islands.

Dogs fit easily into a foraging lifestyle, but humans also domesticated animals that led them to completely alter their way of life. In about 9000 B.C.E., at the same time they began to raise crops, people in the Fertile Crescent domesticated wild goats and sheep, probably using them first for meat, and then for milk, skins, and eventually fleece (see Map 1.2). They learned from observation and experimentation that traits are passed down from generation to generation, and they began to breed the goats and sheep selectively for qualities that they wanted. Sometimes they trained dogs to assist them in herding, and then selectively bred the dogs for qualities that were advantageous for this task.

Head of a Sheep Carved in sandstone at the southern end of the Tigris and Euphrates Valleys about 3200 B.C.E., this head was originally part of a full sculpture of a sheep. By this time, meat, milk, skins, and fleece from domesticated sheep were essential to settled agriculturalists and nomadic pastoralists in much of southwest Asia, and their importance came to be reflected in material culture.

Sometime after goats and sheep, pigs were domesticated in both the Fertile Crescent and China, as were chickens in southern Asia. Like domesticated crops, domesticated animals eventually far outnumbered their wild counterparts. Animal domestication also shaped human evolution; groups that relied on animal milk and milk products for a significant part of their diet tended to develop the ability to digest milk as adults, while those that did not remained lactose intolerant as adults, the normal condition for mammals.

Sheep and goats allow themselves to be herded, and people developed a new form of living, **pastoralism**, based on herding and raising livestock. In areas with sufficient rainfall and fertile soil, pastoralism can be relatively sedentary and thus is easily combined with horticulture; people built pens for animals, or in colder climates constructed special buildings or took them into their houses. They learned that animal manure increases crop yields, so they gathered the manure from enclosures and used it as fertilizer.

pastoralism An economic system based on herding flocks of goats, sheep, cattle, or other animals.

Increased contact with animals and their feces also increased human contact with various sorts of disease-causing pathogens. This was particularly the case where humans and animals lived in tight quarters. Thus pastoralists and agriculturalists developed illnesses that had not plagued foragers, and the diseases became endemic, that is, widely found within a region without being deadly. Ultimately people who lived with animals developed resistance to some of these illnesses, but foragers’ lack of resistance to many illnesses meant that they died more readily after coming into contact with new endemic diseases, as was the case when Europeans brought smallpox to the Americas in the sixteenth century.

In drier areas, flocks need to travel long distances from season to season to obtain enough food, so some pastoralists became nomadic. Nomadic pastoralists often gather wild plant foods as well, but they tend to rely primarily on their flocks of animals for food. Pastoralism was well suited to areas where the terrain or climate made crop planting difficult, such as mountains, deserts, dry grasslands, and tundras. Eventually other grazing animals, including cattle, camels, horses, yak, and reindeer, also became the basis of pastoral economies in Central and West Asia, many parts of Africa, and far northern Europe.

Plow Agriculture

Horticulture and pastoralism brought significant changes to human ways of life, but the domestication of certain large animals had an even bigger impact. Cattle and water buffalo were domesticated in some parts of Asia and North Africa in which they occurred naturally by at least 7000 B.C.E., and horses, donkeys, and camels by about 4000 B.C.E. All these animals can be trained to carry people or burdens on their backs and to pull loads dragged behind them. The domestication of large animals dramatically increased the power available to humans to carry out their tasks, which had both an immediate effect in the societies in which this happened and a long-term effect when these societies later encountered societies in which human labor remained the only source of power.

The pulling power of animals came to matter most, because it could be applied to food production. Sometime in the seventh millennium B.C.E., people attached wooden sticks to frames that animals dragged through the soil, thus breaking it up and allowing seeds to sprout more easily. These simple scratch plows were modified over millennia to handle different types of soil and other challenges. Using plows, Neolithic people produced a significant amount of surplus food, which meant that some people in the community could spend their days performing other tasks, increasing the division of labor. Surplus food had to be stored, and some began to specialize in making products for storage, such as pots, baskets, and other kinds of containers. Others specialized in making tools, houses, and other items needed in village life, or in producing specific types of food, including alcoholic beverages made from fermented fruits and grains. Families and households became increasingly interdependent, trading food for other commodities or services. In the same way that foragers had continually improved their tools and methods, people improved the processes through which they made things. Sometime between 4000 and 3500 B.C.E. pot makers in Mesopotamia invented the potter’s wheel. Between 3500 and 3000 B.C.E. people in several parts of the world adapted wheels for use on carts and plows pulled by animals, combining wheels with axles to allow them to spin freely. Wheeled vehicles led to road building, and wheels and roads together made it possible for people and goods to travel long distances more easily, whether for settlement, trade, or conquest.

This two-handled pot, made in the Yellow River Valley of baked ceramics, is painted in a swirling red and black geometric design. Neolithic agricultural communities produced a wide array of storage containers for keeping food and other commodities from one season to the next.

Stored food was also valuable and could become a source of conflict, as could other issues in villages where people lived close together. Villagers needed more complex rules than did foragers about how food was to be distributed and how different types of work were to be valued. Certain individuals began to specialize in the determination and enforcement of these rules, and informal structures of power gradually became more formalized as elites developed. These elites then distributed resources to their own advantage, often using force to attain and maintain their power.

Neolithic Society

How did growing social and gender hierarchies and expanding networks of trade increase the complexity of human society in the Neolithic period?

The division of labor that plow agriculture allowed led to the creation of **social hierarchies**, the divisions between rich and poor, elites and common people that have been a central feature of human society since the Neolithic era. Plow agriculture also strengthened differentiation based on gender, with men becoming more associated with the world beyond the household and women with the domestic realm. Social hierarchies were reinforced over generations as children inherited goods and status from their parents. People increasingly communicated ideas within local and regional networks of exchange, just as they traded foodstuffs, tools, and other products.

social hierarchies Divisions between rich and poor, elites and common people that have been a central feature of human society since the Neolithic era.

Social Hierarchies and Slavery

Within foraging groups, some individuals already had more authority because of their links with the world of gods and spirits, positions as heads of kin groups, or personal characteristics. These three factors gave individuals advantages in agricultural societies, and the advantages became more significant over time as there were more resources to control. Priests and shamans became full-time religious specialists, exchanging their services in interceding with the gods for food. In many communities, religious specialists were the first to work out formal rules of conduct that later became oral and written codes of law. The codes often required people to accord deference to priests as the representatives of the gods, so that they became an elite group with special privileges.

Individuals who were the heads of large families or kin groups had control over the labor of others, and this power became more significant when that labor brought material goods that could be stored. Material goods — plows, sheep, cattle, sheds, pots, carts — gave one the ability to amass still more material goods, and the gap between those who had them and those who did not widened. Storage also allowed wealth to be retained over long periods of time and handed down from one family member to another, so that over generations small differences in wealth grew larger.

The ability to control the labor of others could also come from physical strength, a charismatic personality, or leadership talents, and such traits may have also led to greater wealth.

Wealth itself could command labor, as individuals or families could buy the services of others to work for them or impose their wishes through force, hiring soldiers to threaten or carry out violence. Eventually some individuals bought others outright. Slavery predates written records, but it developed in almost all agricultural societies. Like animals, slaves were a source of physical power for their owners, providing them an opportunity to amass still more wealth and influence.

Gender Hierarchies and Inheritance

Along with hierarchies based on wealth and power, the development of agriculture was intertwined with a hierarchy based on gender. The system in which men have more power and access to resources than women, and some men are dominant over other men, is called **patriarchy**. Every society in the world that has left written records has been patriarchal, but as patriarchy came before writing, we can conclude that it originated in the early Neolithic, the Paleolithic, or perhaps even in the hominid past.

patriarchy Social system in which men have more power and access to resources than women, and some men are dominant over other men.

Plow agriculture heightened patriarchy. Although farming with a hoe was often done by women, plow agriculture came to be a male task, perhaps because of men’s upper-body strength or because plow agriculture was more difficult to combine with care for infants and small children than was horticulture. At the same time that cattle began to be raised for pulling plows and carts rather than for meat, sheep began to be raised primarily for wool. Spinning thread and weaving cloth became primarily women’s work. Spinning and weaving were generally done indoors and involved simpler and cheaper tools than did plowing; they could also be taken up and put down easily, and so could be done at the same time as other tasks.

Though in some ways this arrangement seems complementary, with each sex doing some of the necessary labor, plow agriculture increased gender hierarchy. Men’s responsibility for plowing and other agricultural tasks took them outside the household more often than women’s duties did, enlarging their opportunities for leadership. This role may have led to their being favored as inheritors of family land and the right to farm communally held land. Accordingly, over generations, women’s independent access to resources decreased, and it became increasingly difficult for women to survive without male support.

As inherited wealth became more important, men wanted to make sure that their sons were theirs, so they restricted their wives’ movements and activities. This was especially the case among elite families. Among foragers and horticulturalists, women needed to be mobile for the group to survive; their labor outdoors was essential. Among agriculturalists, the labor of animals, slaves, and hired workers could substitute for that of women in families that could afford them. Thus in some Neolithic societies, there is evidence that women spent more and more of their time within the household. Social norms and ideals gradually reinforced this pattern, so that by the time written laws and other records emerged in the second millennium B.C.E., elite women were expected to work at tasks that would not take them beyond the household or away from male supervision. Non-elite women also tended to do work that could be done within or close by the household, such as cooking, cloth production, and the care of children, the elderly, and small animals.

Social and gender hierarchies were enhanced over generations as wealth was passed down unequally, and they were also enhanced by rules and norms that shaped sexual relationships, particularly heterosexual ones. However their power originated, elites began to think of themselves as a group set apart from the rest by some element that made them distinctive — such as military prowess, natural superiority, or connections with a deity. They increasingly understood this distinctive quality to be hereditary and tended to marry within their group, a social endogamy we might think of as the selective breeding of people. They developed traditions — later codified as written laws — that stipulated how such marriages would pass status and wealth to the next generation. Relationships between elite men and non-elite women generally did not function in this way, or did so to a lesser degree; the women were defined as concubines or mistresses, or simply as sexual outlets for powerful men. Relations between an elite woman and a non-elite man generally brought shame and dishonor to the woman’s family and sometimes death to the man. (Early rules and laws about sex generally did not pay much attention to same-sex relations because these did not produce children who could threaten systems of inheritance.)

No elite can be completely closed to newcomers, however, because the accidents of life and death, along with the genetic problems caused by repeated close intermarriage, make it difficult for any small group to survive over generations. Thus mechanisms were developed in many cultures to adopt boys into elite families, to legitimate the children of concubines and slave women, or to allow elite girls to marry men lower on the social hierarchy. All systems of inheritance also need some flexibility. The inheritance patterns in some cultures favored male heirs exclusively, but in others close relatives were favored over those more distant, even if this meant allowing daughters to inherit. The drive to keep wealth and property within a family or kin group often resulted in women's inheriting, owning, and in some cases managing significant amounts of wealth, a pattern that continues today. Hierarchies of wealth and power thus intersected with hierarchies of gender in complex ways.

Trade and Cross-Cultural Connections

The increase in food production brought by the development of plow agriculture allowed Neolithic villages to grow ever larger. By 7000 B.C.E. or so, some villages in the Fertile Crescent may have had as many as ten thousand residents. One of the best known of these, Çatal Hüyük (cha-TAHL hoo-YOOK) in what is now modern Turkey, shows evidence of trade as well as of the specialization of labor. Çatal Hüyük's residents lived in mud-brick houses whose walls were covered in white plaster. The men and women of the town grew wheat, barley, peas, and almonds and raised sheep and perhaps cattle, though they also seem to have hunted. They made textiles, pots, figurines, baskets, carpets, copper and lead beads, and other goods. They gathered, sharpened, and polished obsidian, a volcanic rock that could be used for knives, blades, and mirrors, and then traded it with neighboring towns. From here the obsidian was exchanged still farther away, for Neolithic societies slowly developed local and then regional networks of exchange and communication.

Among the goods traded in some parts of the world was copper. Pure copper occurs close to the surface in some areas, and people, including those at Çatal Hüyük, hammered it into shapes for jewelry and tools. More often, copper, like most metals, occurs mixed with other materials in a type of rock called ore, and by about 5500 B.C.E. people in the Balkans had learned that copper could be extracted from ore by heating it in a smelting process. (See "Individuals in Society: The Iceman," page 25.) Smelting techniques were discovered independently in many places around the world, including China, Southeast Asia, West Africa, and the Andes region. Pure copper is soft, but through experimentation artisans learned that it would become harder if they mixed it with other metals such as arsenic, zinc, or tin during heating, creating an alloy called bronze.

Because it was stronger than copper, bronze had a far wider range of uses, so much so that later historians decided that its adoption marked a new period in human history, the Bronze Age. It began about 3000 B.C.E. in some places, and by about 2500 B.C.E. bronze technology was having an impact in many parts of the world, especially in weaponry. The end of the Bronze Age came with the adoption of iron technology, which also varied in its beginnings from 1200 B.C.E. to 300 B.C.E. All metals were expensive and hard to obtain, however, which meant that stone, wood, bone, leather, bark, and grasses remained important materials for tools and weapons long into the Bronze Age, and the only materials in the vast parts of the world where metals were unobtainable.

Objects were not the only things traded over increasingly long distances during the Neolithic period, for people also carried ideas as they traveled. Knowledge about the seasons and the weather was vitally important for those who depended on crop raising, and agricultural peoples in many parts of the world began to calculate recurring patterns in the world around them, slowly developing calendars. Scholars have demonstrated that people built circular structures of mounded earth or huge upright stones to help them predict the movements of the sun and stars.

Stone Circle at Nabta Playa, Egypt, ca. 4800 B.C.E. This circle of stones, erected when the Egyptian desert received much more rainfall than it does today, may have been a type of calendar marking the summer solstice. Circular arrangements of stones or ditches were constructed in many places during the Neolithic era, and most no doubt had calendrical, astronomical, and/or religious purposes.

The rhythms of the agricultural cycle and patterns of exchange also shaped religious beliefs and practices. Shamans and priests developed ever more elaborate rituals designed to assure fertility, in which the gods were often given something from a community’s goods in exchange for their favor. In many places gods came to be associated with patterns of birth, growth, death, and regeneration. Like humans, the gods came to have a division of labor and a social hierarchy. Thus, as human society was becoming more complex, so was the unseen world.

The Iceman

The artifacts found with the body tell scientists much about how the Iceman lived. The Iceman's shoes, made with a twine framework stuffed with straw and covered with skin, indicate that he used all parts of the animals he hunted.

ON SEPTEMBER 19, 1991, TWO GERMAN VACATIONERS climbing in the Italian Alps came upon a corpse lying facedown and covered in ice. Scientists determined that the Iceman, as the corpse is generally known, died 5,300 years ago. He was between twenty-five and thirty-five years old at the time of his death, and he stood about five feet two inches tall. An autopsy revealed much about the man and his culture. The bluish tinge of his teeth showed a diet of milled grain, which proves that he came from an environment where crops were grown. The Iceman hunted as well as farmed: he was found with a bow and arrows and shoes of straw, and he wore a furry cap and a robe of animal skins that had been stitched together with thread made from grass.

The equipment discovered with the Iceman demonstrates that his people mastered several technologies. He carried a hefty copper ax, made by someone with a knowledge of metallurgy. In his quiver were numerous wooden arrow shafts and two finished arrows. The arrows had sharpened flint heads and feathers attached to the ends of the shafts with resin-like glue. Apparently the people of his culture knew the value of feathers to direct the arrow and thus had mastered the basics of ballistics. His bow was made of yew, a relatively rare wood in central Europe that is among the best for archers.

Yet a mystery still surrounds the Iceman. When his body was first discovered, scholars assumed that he was a hapless traveler overtaken in a fierce snowstorm. But the autopsy found an arrowhead lodged under his left shoulder. The Iceman was not alone on his last day. Someone was with him, and that someone had shot him from below and behind. The Iceman is the victim in the first murder mystery in Europe, and the case will never be solved.

QUESTIONS FOR ANALYSIS

1. What does the autopsy of the corpse indicate about the society in which the Iceman lived?
2. How do the objects found with the Iceman support the generalizations about Neolithic society in this chapter?

Chapter Summary

Through studying the physical remains of the past, sometimes with very new high-tech procedures such as DNA analysis, scholars have determined that human evolution involved a combination of factors, including bipedalism, larger brain size, spoken symbolic language, and longer periods of infancy. Humans invented ever more complex tools, many of which were made of stone, from which later scholars derived the name for this earliest period of human history, the Paleolithic era. These tools allowed Paleolithic peoples to shape the world around them. During this era, humans migrated out of Africa, adapting to many different environments and developing diverse cultures. Early humans lived in small groups of related individuals, moving through the landscape as foragers in the search for food.

Beginning about 9000 B.C.E. people living in southwest Asia, and then elsewhere, began to plant seeds as well as gather wild crops, raise certain animals, and selectively breed both plants and animals to make them more useful to humans. This domestication of plants and animals was the most important change in human history and marked the beginning of the Neolithic era. The domestication of large animals led to plow agriculture, through which humans could raise much more food, and the world's population grew. Plow agriculture allowed for a greater division of labor, which strengthened social hierarchies based on wealth and gender. Neolithic agricultural communities developed technologies to meet their needs and often traded with one another for products that they could not obtain locally. Religious ideas came to reflect the new agricultural society.

CONNECTIONS

The human story is often told as a narrative of unstoppable progress toward greater complexity. The small kin groups of the Paleolithic gave way to Neolithic villages that grew ever larger until they became cities. Egalitarian foragers became stratified by divisions of wealth and power that were formalized as aristocracies, castes, and social classes. Oral rituals of worship, healing, and celebration in which everyone participated grew into a dizzying array of religions, philosophies, and branches of knowledge presided over by specialists. The rest of this book traces this story and explores the changes over time that are the central thread of history.

As you examine what can seem to be a staggering number of developments, it is also important to remember that many things were slow to change and that some aspects of human life in the Neolithic, or even the Paleolithic, continued. Foraging, horticulture, pastoralism, and agriculture have been the primary economic activities of most people throughout the entire history of the world. Though today there are only a few foraging groups in very isolated areas, there are significant numbers of horticulturalists and pastoralists, and their numbers were much greater just a century ago. At that point the vast majority of the world’s people still made their living directly through agriculture. The social patterns set in early agricultural societies — with most of the population farming the land and a small number of elite who lived off their labor — lasted for millennia. You have no doubt recognized other similarities between the early peoples discussed in this chapter and the people you see around you, and it is important to keep these continuities in mind as you embark on your examination of human history.

Review the Main Ideas

Answer the focus questions from each section of the chapter.

1. How did humans evolve, and where did they migrate? (p. 4)
2. What were the key features of Paleolithic society? (p. 10)
3. How did plant and animal domestication develop, and what effects did it have on human society? (p. 13)
4. How did growing social and gender hierarchies and expanding networks of trade increase the complexity of human society in the Neolithic period? (p. 22)

Make Comparisons and Connections

Analyze the larger developments and continuities within and across chapters.

1. Why is the Agricultural Revolution called the most important change in human history?
2. What continuities persisted between the Paleolithic and Neolithic eras?
3. Why and how did social hierarchies develop?

4. Along with basic ways of life such as foraging, horticulture, pastoralism, and agriculture, what other aspects of society that developed in the Neolithic do you see around you today? What might account for these continuities stretching across millennia?

Complex Societies in Southwest Asia and the Nile Valley

3800–500 B.C.E.

Louvre, Paris, France/Erich Lessing/Art Resource, NY

Persian Archers

In this colorful decorative frieze made of glazed brick, men wearing long Persian robes and laced ankle boots carry spears, bows, and quivers. This reconstruction in the Louvre Museum in Paris was made from material found in the palace of King Darius I of Persia in Susa, built about 510 B.C.E. Enough bricks were found there to suggest that there were originally many archers, perhaps representing Darius's royal guards or symbolizing the entire Persian people.

Five thousand years ago, humans were living in most parts of the planet. They had designed technologies to meet the challenges presented by deep forests and jungles, steep mountains, and blistering deserts. As the climate changed, they adapted, building boats to cross channels created by melting glaciers and finding new sources of food when old sources were no longer plentiful. In some places the new sources included domesticated plants and animals, which allowed people to live in much closer proximity to one another than they had as foragers.

That proximity created opportunities, as larger groups of people pooled their knowledge to deal with life's challenges, but it also created problems. Human history from that point on can be seen as a response to these opportunities, challenges, and conflicts. As small villages grew into cities, people continued to develop technologies and systems to handle new issues. To control their more complex societies, people created governments, militaries, and taxation systems. In some places they invented writing to record taxes, inventories, and payments, and they later put writing to other uses. The first places where these new technologies and systems were introduced were the Tigris and Euphrates River Valleys of southwest Asia and the Nile Valley of northeast Africa, areas whose histories became linked through trade, military conquests, and migrations.

Writing, Cities, and States

How does writing shape what we can know about the past, and how did writing develop to meet the needs of cities and states?

The remains of buildings, burial sites, weapons, tools, artwork, and other handmade objects provide our only evidence of how people lived, thought, felt, and died during most of the human past. Beginning about 5,000 years ago, however, people in some parts of the world developed a new technology, writing. Writing developed to meet the needs of more complex urban societies that are often referred to as “civilizations.” In particular, writing met the needs of the state, a new political form that developed during the time covered in this chapter.

Written Sources and the Human Past

Historians who study human societies that developed systems of writing continue to use many of the same types of physical evidence as do those who study societies without writing. For some cultures, the writing or record-keeping systems have not yet been deciphered, so our knowledge of these people also depends largely on physical evidence. Scholars can read the writing of a great many societies, however, adding greatly to what we can learn about them.

Much ancient writing survives only because it was copied and recopied, sometimes years after it was first produced. The survival of a work means that someone from a later period — and often a long chain of someones — judged it worthy of the time, effort, and resources needed to produce copies. The copies may not be completely accurate. Historians studying ancient works thus often try to find as many early copies as they can and compare them to arrive at the version they think is closest to the original.

The works considered worthy of copying tend to be those that are about the political and military events involving major powers, those that record religious traditions, or those that come from authors who were later regarded as important. By contrast, written sources dealing with the daily life of ordinary men and women were few to begin with and were rarely saved or copied because they were not considered significant.

Clay Letter Written in Cuneiform and Its Envelope, ca. 1850 B.C.E. In this letter from a city in Anatolia, located on the northern edge of the Fertile Crescent in what is now southern Turkey, a Mesopotamian merchant complains to his brother at home, hundreds of miles away, that life is hard and comments on the trade in silver, gold, tin, and textiles. Correspondents often enclosed letters in clay envelopes and sealed them by rolling a cylinder seal across the clay, leaving the impression of a scene, just as you might use a stamped wax seal today. Here the very faint impression of the sender's seal at the bottom shows a person, probably the owner of the seal, being led in a procession toward a king or god.

Some early written texts survive in their original form because people inscribed them in stone, shells, bone, or other hard materials, intending them to be permanent. Stones with inscriptions were often erected in the open in public places for all to see, so they include text that leaders felt had enduring importance, such as laws, religious proclamations, decrees, and treaties. (The names etched in granite on the Vietnam Veterans Memorial in Washington, D.C., are perhaps the best-known modern example, but inscriptions can be found on nearly every major public building.) Sometimes this permanence was accidental: in ancient Mesopotamia (in the area of modern Iraq), all writing was initially made up of indentations on soft clay tablets, which then hardened. Hundreds of thousands of these tablets have survived, the oldest written in cuneiform (see "Writing, Mathematics, and Poetry") and dating to about 3200 B.C.E. From these written records historians have learned about many aspects of everyday life. By contrast, writing in Egypt at the same time was often done in ink on papyrus sheets, made from a plant that grows abundantly in Egypt. Some of these papyrus sheets have survived, but papyrus is much more fragile than hardened clay, so most have disintegrated. In China, the oldest surviving writing is on bones and turtle shells from about 1200 B.C.E., but it is clear that writing was done much earlier on less permanent materials such as silk and bamboo. (For more on the origins of Chinese writing, see “The Development of Writing” in Chapter 4.)

Cities and the Idea of Civilization

Along with writing, the growth of cities has often been a way that scholars mark the increasing complexity of human societies. In the ancient world, residents of cities generally viewed themselves as more advanced and sophisticated than rural folk — a judgment still made today by urban dwellers. They saw themselves as more “civilized,” a word that comes from the Latin adjective *civilis*, which refers to either a citizen of a town or of a larger political unit such as an empire.

This depiction of people as either civilized or uncivilized was gradually extended to whole societies. Beginning in the eighteenth century European scholars described those societies in which political, economic, and social organizations operated on a large scale as “civilizations.” Civilizations had cities; laws that governed human relationships; codes of manners and social conduct that regulated how people were to behave; and scientific, philosophical, and theological ideas that explained the larger world. Generally only societies that used writing were judged to be civilizations.

Until the middle of the twentieth century, historians often referred to the earliest places where writing and cities developed as the “cradles of civilization,” proposing a model of development for all humanity patterned on that of an individual person. However, the idea that all human societies developed (or should develop) in a uniform process from a “cradle” to a “mature” civilization has now been largely discredited, and some world historians choose not to use the word *civilization* at all because it could imply that some societies are superior to others. But they have not rejected the idea that about 5,000 years ago a new form of human society appeared.

The Rise of States, Laws, and Social Hierarchies

Cities concentrated people and power, and they required more elaborate mechanisms to make them work than had small agricultural villages and foraging groups. These mechanisms were part of what political scientists call “the state,” an organization in which a share of the population is able to coerce resources out of everyone else in order to gain and then maintain power. In the earliest states, the interest that gained power was often one particular family or kin group, a set of religious leaders, or even a charismatic or talented individual able to handle the problems of dense urban communities. These same types of states continue to today as monarchies, theocracies, and dictatorships, joined by types of states that developed more recently, such as democracies, in which power is understood to reside in “the people.”

However they were and are established, states coerce people through violence, or the threat of violence, and develop armies and police forces for this purpose; even in democracies, people can be forced to do things they do not want to do with the threat of imprisonment or other punishment. Using armed force to gain resources is not very efficient, however, so states developed other ways to do this, such as bureaucracies and systems of taxation. States also need to keep track of people and goods, so they sometimes developed systems of recording information and accounting, usually through writing, though not always. In the Inca Empire of the Andes, for example, information about money, goods, and people was recorded on collections of colored knotted strings called *khipus* (see “Societies of the Americas in a Global Context” in Chapter 11). These systems allowed for the creation of more elaborate rules of behavior, often written down in the form of law codes, which facilitated further growth in state power, or in the form of religious traditions, which specified what sort of behavior is pleasing to the gods or other supernatural forces and thus convinced people to act in certain ways.

Written laws and traditions generally create more elaborate social hierarchies, in which divisions between elite groups and common people are established more firmly. They also generally heighten gender hierarchies. Those who gain power in states are most often men, so they tend to establish laws and norms that favor males in marriage, property rights, and other areas.

Whether we choose to call the process “the birth of civilization,” or “the development of complex society,” or “the growth of the state,” in the fourth millennium B.C.E. Neolithic agricultural villages expanded into cities that depended largely on food produced by the surrounding countryside while people living in cities carried out other tasks. The organization of a more complex division of labor was undertaken by an elite group, which enforced its will through laws, taxes, and bureaucracies backed up by armed force or the threat of it. Social and gender hierarchies became more complex and rigid. All this happened first in Mesopotamia, then in Egypt, and then in India and China.

Mesopotamia from Sumer to Babylon

How did the peoples of Mesopotamia form states and develop new technologies and institutions?

States first developed in Mesopotamia, where sustained agriculture reliant on irrigation from the Euphrates (you-FRAY-teez) and Tigris Rivers resulted in larger populations, a division of labor, and the growth of cities. Priests and rulers developed ways to control and organize these complex societies. Conquerors from the north unified Mesopotamian city-states into larger empires and spread Mesopotamian culture over a large area.

Environmental Challenges, Irrigation, and Religion

Mesopotamia was part of the Fertile Crescent, where settled agriculture first developed (see “The Development of Horticulture” in Chapter 1). The earliest agricultural villages in Mesopotamia were in the northern, hilly parts of the river valleys, where there is abundant rainfall for crops. Farmers had brought techniques of crop raising southward by about 5000 B.C.E., to the southern part of Mesopotamia known as Sumer (SOO-mer). In this arid climate farmers developed large-scale irrigation, which required organized group effort but allowed the population to grow. By about 3800 B.C.E. one of these agricultural villages, Uruk (OO-rook), had expanded significantly, becoming what many historians view as the world’s first city. Over the next thousand years, other cities emerged in Sumer, trading with one another and creating massive hydraulic projects including reservoirs, dams, and dikes to prevent major floods. These cities built defensive walls, marketplaces, and large public buildings; each came to dominate the surrounding countryside, becoming city-states independent from one another, though not very far apart.

The city-states of Sumer relied on irrigation systems that required cooperation and at least some level of social and political cohesion. The authority to run this system was, it seems, initially assumed by Sumerian priests. Encouraged and directed by their religious leaders, people built temples on tall platforms in the center of their cities. Temples grew into elaborate complexes of buildings with storage space for grain and other products and housing for animals. (Much later, by about 2100 B.C.E., some of the major temple complexes were embellished with a huge stepped pyramid, called a ziggurat, with a shrine on the top.) Surrounding the temple and other large buildings were the houses of ordinary citizens, each constructed around a central courtyard.

Sumerian Harpist This small clay tablet, carved between 2000 B.C.E. and 1500 B.C.E., shows a seated woman playing a harp. Her fashionable dress and hat suggest that she is playing for wealthy people, perhaps at the royal court. Images of musicians are common in Mesopotamian art, which indicates that music was important in Mesopotamian culture and social life.

To Sumerians, and to later peoples in Mesopotamia as well, many different gods and goddesses controlled the world, a religious idea later scholars called **polytheism**. Each deity represented cosmic forces such as the sun, moon, water, and storms. The gods judged good and evil and would punish humans who lied or cheated. People believed that humans had been created to serve the gods and generally anticipated being well treated by the gods if they honored them through rituals and temples.

polytheism The worship of many gods and goddesses.

Sumerian Politics and Society

Exactly how kings emerged in Sumerian society is not clear. Scholars have suggested that during times of crisis a chief priest or sometimes a military leader assumed what was supposed to be temporary authority over a city. He established an army, trained it, and led it into battle. Temporary power gradually became permanent kingship, and kings in some Sumerian city-states began to hand down the kingship to their sons, establishing patriarchal hereditary dynasties in which power was handed down through the male line. The symbol of royal status was the palace, which came to rival the temple in its grandeur.

Kings made alliances with other powerful individuals, often through marriage. Royal family members were responsible for many aspects of government. Kings worked closely with religious authorities and relied on ideas about their connections with the gods, as well as the kings' military might, for their power. Royal children, both sons and daughters, were sometimes priests and priestesses in major temples. Acting together, priests, nobles, and kings in Sumerian cities used force, persuasion, and threats of higher taxes to maintain order, keep the irrigation systems working, and keep food and other goods flowing.

The king and the nobles held extensive tracts of land, as did the temple; these lands were worked by the palace's or the temple's clients — free men and women who were dependent on the palace or the temple. They received crops and other goods in return for their labor. Although this arrangement assured the clients of a livelihood, the land they worked remained the possession of the palace or the temple. Some individuals and families owned land outright and paid their taxes in the form of agricultural products or items they made. At the bottom rung of society were slaves. Like animals, slaves were a source of physical power for their owners, providing them an opportunity to amass more wealth and influence.

Each of these social categories included both men and women, but their experiences were not the same, for Sumerian society made distinctions based on gender. Most elite landowners were male, but women who held positions as priestesses or as queens ran their own estates independently of their husbands and fathers. Some women owned businesses and took care of their own accounts. They could own property and distribute it to their offspring. Sons and daughters inherited from their parents, although a daughter received her inheritance in the form of a dowry, which technically remained hers but was managed by her husband or husband's family after marriage. The Sumerians established the basic social, economic, and intellectual patterns of Mesopotamia and influenced their neighbors to the north and east.

Writing, Mathematics, and Poetry

The origins of writing probably date back to the ninth millennium B.C.E., when people in southwest Asia used clay tokens as counters for record keeping. By the fourth millennium people had realized that impressing the tokens on soft clay, or drawing pictures of the tokens on clay, was simpler than making tokens. This breakthrough in turn suggested that more information could be conveyed by adding pictures of other objects, and slowly the new technology of writing developed. The result was a complex system of pictographs in which each sign pictured an object, such as “star” (line A of Figure 2.1). These pictographs were the forerunners of the Sumerian form of writing known as **cuneiform** (kyou-NEE-uh-form), for which the first surviving examples date from about 3200 B.C.E.

Figure 2.1 Sumerian Writing

Pictographs were initially limited in that they could not represent abstract ideas, but the development of ideograms — signs that represented ideas — made writing more versatile. Thus the sign for “star” could also be used to indicate “heaven,” “sky,” or even “god.” The real breakthrough came when scribes started using signs to represent sounds. For instance, the symbol for “water” (two parallel wavy lines) could also be used to indicate “in,” which sounded the same as the spoken word for “water” in Sumerian.

The development of the Sumerian system of writing was piecemeal, with scribes making changes and additions as they were needed. The system became so complicated that the Sumerians established scribal schools, which by 2500 B.C.E. flourished throughout the region. Students at the schools were all male, and most came from families in the middle range of urban society. Scribal schools were primarily intended to produce individuals who could keep records of the property of temple officials, kings, and nobles. Thus writing first developed as a way to enhance the growing power of elites, not to record speech.

Sumerians wrote numbers as well as words on clay tablets, and some surviving tablets show multiplication and division problems. The Sumerians and later Mesopotamians made significant advances in mathematics using a numerical system based on units of sixty, ten, and six, from which we derive our division of hours into sixty minutes and minutes into sixty seconds. They also developed the concept of place value — that the value of a number depends on where it stands in relation to other numbers.

Written texts were not an important part of Sumerian religious life, nor were they central to the religious practices of most of the other peoples in this region. Stories about the gods circulated orally and traveled with people when they moved up and down the rivers. Sumerians also told stories about heroes and kings, many of which were eventually reworked into the world’s first **epic poem**, the *Epic of Gilgamesh* (GIL-guh-mesh), which was later written down. (See “Analyzing the Evidence: Gilgamesh’s Quest for Immortality,”.)

epic poem An oral or written narration of the achievements and sometimes the failures of heroes that embodies peoples’ ideas about themselves.

ANALYZING THE EVIDENCE

Gilgamesh's Quest for Immortality

The human desire to escape the grip of death appears in many cultures. The *Epic of Gilgamesh* is perhaps the earliest recorded treatment of this topic. The oldest elements of the epic go back to stories told in the third millennium B.C.E. According to tradition, Gilgamesh was a king of the Sumerian city of Uruk. In the story, Gilgamesh is not fulfilling his duties as the king very well and sets out with his friend Enkidu to perform wondrous feats against fearsome agents of the gods. Together they kill several supernatural beings, and the gods decide that Enkidu must die. He foresees his own death in a dream.

Listen again, my friend [Gilgamesh]! I had a dream in the night.
The sky called out, the earth replied,
I was standing in between them.
There was a young man, whose face was obscured.
His face was like that of an Anzu-bird.
He had the paws of a lion, he had the claws of an eagle.
He seized me by my locks, using great force against me….
He seized me, drove me down to the dark house, dwelling of Erkalla's god [the underworld], …
On the road where travelling is one way only,
To the house where those who stay are deprived of light….

[Enkidu sickens and dies. Gilgamesh is distraught and determined to become immortal. He decides to journey to Ut-napishtim and his wife, the only humans who have eternal life. Everyone he meets along the way asks him about his appearance, and Gilgamesh always answers with the same words.]

How could my cheeks not be wasted, nor my face dejected,
Nor my heart wretched, nor my appearance worn out,
Nor grief in my innermost being,
Nor my face like that of a long-distance traveller,
Nor my face weathered by wind and heat
Nor roaming open country clad only in a lionskin?
My friend was the hunted mule, wild ass of the mountain, leopard of open country,
Enkidu my friend was the hunted mule, wild ass of the mountain, leopard of open country.
We who met, and scaled the mountain,
Seized the Bull of Heaven [the sacred bull of the goddess Ishtar] and slew it,
Demolished Humbaba [the ogre who guards the forest of the gods] who dwelt in the Pine Forest,
Killed lions in the passes of the mountains,

My friend whom I love so much, who experienced every hardship with me,
Enkidu my friend whom I love so much, who experienced every hardship with me —
The fate of mortals conquered him!
For six days and seven nights I wept over him: I did not allow him to be buried
Until a worm fell out of his nose.
I was frightened and
I am afraid of Death, and so I roam open country.
The words of my friend weigh upon me….
I roam open country on long journeys.
How, O how could I stay silent, how, O how could I keep quiet?
My friend whom I love has turned to clay: Enkidu my friend whom I love has turned to clay.
Am I not like him? Must I lie down too,
Never to rise, ever again?

[Gilgamesh finally reaches Ut-napishtim, to whom he tells his story, and who says to him:]

Why do you prolong grief, Gilgamesh?
Since [the gods made you] from the flesh of gods and mankind,
Since [the gods] made you like your father and mother
[Death is inevitable] …,
Nobody sees the face of Death,
Nobody hears the voice of Death.
Savage Death just cuts mankind down.
Sometimes we build a house, sometimes we make a nest,
But then brothers divide it upon inheritance.
Sometimes there is hostility in [the land],
But then the river rises and brings flood-water….
The Anunnaki, the great gods, assembled;
Mammitum [the great mother goddess] who creates fate decreed destinies with them.
They appointed death and life.
They did not mark out days for death,
But they did so for life.

[Gilgamesh asks Ut-napishtim how he and his wife can be immortal like the gods, if death is inevitable. Ut-napishtim tells him the story of how they survived a flood sent by the gods and the chief god Enlil blessed them with eternal life. Gilgamesh wants this as well, but fails two opportunities Ut-napishtim provides for him to achieve it. At the end of the epic, he simply returns to Uruk with the boatman Ur-shanabi, to whom he points out the glories of the city.]

Go up on to the wall of Uruk, Ur-shanabi, and walk around,

Inspect the foundation platform and scrutinize the brickwork! Testify that its bricks are baked bricks,
And that the Seven Counsellors must have laid its foundations!
One square mile is city, one square mile is orchards, one square mile is claypits, as well as the open ground of Ishtar’s temple.
Three square miles and the open ground comprise Uruk.

QUESTIONS FOR ANALYSIS

1. What does the *Epic of Gilgamesh* reveal about attitudes toward friendship in ancient Mesopotamia?
2. What does the epic tell us about views of the nature of human life? Where do human beings fit into the cosmic world?
3. Although Gilgamesh did not achieve personal immortality at the end of his quest, how can his final words to Ur-shanabi be seen as a tribute to long-lasting human endeavors?

Empires in Mesopotamia

The wealth of Sumerian cities also attracted conquerors from the north. Around 2300 B.C.E. Sargon, the king of a region to the north of Sumer, conquered a number of Sumerian cities with what was probably the world’s first permanent army and created a large state. The symbol of his triumph was a new capital, the city of Akkad (AH-kahd). Sargon also expanded the newly established Akkadian empire westward to northern Syria, which became the breadbasket of the empire. He encouraged trading networks that brought in goods from as far away as the Indus River in South Asia and what is now Turkey (Map 2.1). Sargon spoke a different language than did the Sumerians, one of the many languages that scholars identify as belonging to the Semitic language family, which includes modern-day Hebrew and Arabic. Akkadians adapted cuneiform writing to their own language, and Akkadian became the diplomatic language used over a wide area.

MAP 2.1 **Spread of Cultures in Southwest Asia and the Nile Valley, ca. 3000–1640 B.C.E.** This map illustrates the spread of the Mesopotamian and Egyptian cultures through the semicircular stretch of land often called the Fertile Crescent. From this area, the knowledge and use of agriculture spread throughout western Asia, northern Africa, and Europe.

Sargon tore down the defensive walls of Sumerian cities and appointed his own sons as their rulers to help him cement his power. He also appointed his daughter, Enheduana (en-hoo-DWANN-ah) (2285–2250 B.C.E.), as high priestess in the city of Ur. Here she wrote a number of hymns, becoming the world's first author to put her name to a literary composition. (See "Thinking Like a Historian: Addressing the Gods," page 40.)

Sargon's dynasty appears to have ruled Mesopotamia for about 150 years, and then collapsed, in part because of a period of extended drought. Various city-states then rose to power, one of which was centered on the city of Babylon. Babylon was in an excellent position to dominate trade on both the Tigris and Euphrates Rivers, and it was fortunate in having a very able ruler in Hammurabi (hahm-moo-RAH-bee) (r. 1792–1750 B.C.E.). Initially a typical king of his era, he unified Mesopotamia later in his reign by using military force, strategic alliances with the rulers of smaller territories, and religious ideas. As had earlier rulers, Hammurabi linked his success with the will of the gods. He connected himself with the sun-god Shamash, the god of law and justice, and encouraged the spread of myths that explained how Marduk, the primary god of Babylon, had been elected king of the gods by the other deities in Mesopotamia. Babylonian ideas and beliefs thus became part of the cultural mixture of Mesopotamia, which spread far beyond the Tigris and Euphrates Valleys to the shores of the Mediterranean Sea and the Harappan cities of the Indus River Valley (see "The Land and Its First Settlers, ca. 3000–1500 B.C.E." in Chapter 3).

Naram-Sin, under whose rule Akkad reached its largest size, is shown here as a god-king in a horned helmet, twice the size of the other men.

Life Under Hammurabi

Hammurabi’s most memorable accomplishment was the proclamation of an extensive law code, introduced about 1755 B.C.E. **Hammurabi’s law code** set a variety of punishments for breaking the law, including fines and physical punishment such as mutilation, whipping, and burning. It demanded that the punishment fit the crime, calling for “an eye for an eye and a tooth for a tooth,” at least among social equals, although higher-ranking people could pay a fine to lower-ranking victims instead of having an arm broken or losing an eye.

Law Code of Hammurabi Hammurabi ordered his code to be inscribed on stone pillars and set up in public throughout the Babylonian empire. At the top of the pillar Hammurabi (left) is depicted receiving the rod and ring of authority from Shamash, the god of law and justice.

Hammurabi's code provides a wealth of information about daily life in Mesopotamia, although, like all law codes, it prescribes what the lawgivers hope will be the situation rather than providing a description of real life. We cannot know if its laws were enforced, but we can use it to see what was significant to people in Hammurabi’s society. Because of farming’s fundamental importance, the code dealt extensively with agriculture. Tenants faced severe penalties for neglecting the land or not working it at all. The code also regulated other trades, and artisans had to guarantee the quality of their goods and services to consumers. Hammurabi gave careful attention to marriage and the family. As elsewhere in the area, marriage had aspects of a business agreement. The groom or his father offered the prospective bride’s father a gift, and if this was acceptable, the bride’s father provided his daughter with a dowry, which technically remained hers. A father could not disinherit a son without just cause, and the code ordered the courts to forgive a son for his first offense. On family matters and other issues, Hammurabi’s code influenced other law codes, including those later written down in Hebrew Scripture (see “The Jewish Religion”).

The Egyptians

How did the Egyptians create a prosperous and long-lasting society?

At about the same time that Sumerian city-states expanded and fought with one another in the Tigris and Euphrates Valleys, a more cohesive state under a single ruler grew in the valley of the Nile River in North Africa. This was Egypt, which for long stretches of history was prosperous and secure. At various times groups invaded and conquered Egypt or migrated into Egypt seeking better lives. Often these newcomers adopted aspects of Egyptian culture, and Egyptians also carried their traditions with them when they established an empire and engaged in trade.

The Nile and the God-King

No other single geographical factor had such a fundamental and profound impact on Egyptian life, society, and history as the Nile River (see Map 2.2). The Nile flooded once a year for a period of several months, bringing fertile soil and moisture for farming. Through the fertility of the Nile and their own hard work, Egyptians produced an annual agricultural surplus, which in turn sustained a growing and prosperous population. The Nile also unified Egypt, serving as a highway that promoted easy communication.

Intermediate	B.C.E.	outsiders

The political power structures that developed in Egypt came to be linked with the Nile. Somehow the idea developed that a single individual, a king, was responsible for the rise and fall of the Nile. The king came to be viewed as a descendant of the gods and thus a god himself. This belief came about before the development of writing in Egypt, so the precise details of its origins have been lost. Political unification most likely proceeded slowly, but stories told about early kings highlighted one who had united Upper Egypt (the upstream valley in the south) and Lower Egypt (the delta area of the Nile that empties into the Mediterranean Sea) into a single kingdom around 3100 B.C.E. Historians later divided Egyptian history into dynasties, or families, of kings, and more recently into periods with distinctive characteristics (see the chronology "Periods of Egyptian History"). The political unification of Egypt in the Archaic Period (3100–2660 B.C.E.) ushered in the period known as the Old Kingdom (2660–2180 B.C.E.).

The focal point of religious and political life in the Old Kingdom was the king, who commanded the wealth, resources, and people of Egypt. The king's surroundings had to be worthy of a god, and only a magnificent palace was suitable for his home; in fact, the word **pharaoh**, which during the New Kingdom (1570–1070 B.C.E.) came to be used for the king, originally meant "great house." Just as the kings occupied a great house in life, so they reposed in great pyramids after death. Built during the Old Kingdom, these massive stone tombs contained all the things needed by the king in his afterlife and also symbolized the king's power and his connection with the sun-god.

pharaoh The title given to the king of Egypt in the New Kingdom, from a word that meant "great house."

Like the Mesopotamians, the Egyptians were polytheistic, worshipping many gods of all types, some mightier than others. They developed complex ideas of their gods that reflected the world around them, and these views changed over the many centuries of Egyptian history as gods took on new attributes and often merged with one another. During the Old Kingdom, Egyptians considered the sun-god Ra the creator of life. Much later, during the New Kingdom (see "Migrations, Revivals, and Collapse"), the pharaohs of a new dynasty favored the worship of a different sun-god, Amon. As his cult grew, Amon came to be identified with Ra, and eventually the Egyptians combined them into one sun-god, Amon-Ra.

The Egyptians likewise developed views of an afterlife that reflected the world around them and that changed over time. During the later part of the Old Kingdom, the walls of kings' tombs were carved with religious texts that provided spells that would bring the king back to life and help him ascend to heaven. (See "Thinking Like a Historian: Addressing the Gods," page 40.) Toward the end of the Old Kingdom, the tombs of powerful nobles also contained such inscriptions, an indication that more people expected to gain everlasting life. In the Middle Kingdom (2080–1640 B.C.E.), new types of spells appeared on the coffins of even more people, a further expansion in admissions to the afterlife. During the New Kingdom, a time when Egypt came into greater contact with the cultures of the Fertile Crescent, Egyptians developed even more complex ideas about the afterlife, recording these in written funerary manuscripts that have come to be known as the *Book of the Dead*. These texts explained that the soul left the body to become part of the divine after death and told of the god Osiris (oh-SIGH-ruhs), who died each year and was then brought back to life by his wife Isis (IGH-suhs) when the Nile flooded. Osiris eventually became king of the dead, weighing dead humans' hearts to determine whether they had lived justly enough to deserve everlasting life. Egyptians also believed that proper funeral rituals, in which the physical body was mummified, were essential for life after death, so Osiris was assisted by Anubis, the jackal-headed god of mummification.

To ancient Egyptians, the king embodied justice and order — harmony among people, nature, and the divine. Kings did not always live up to this ideal, of course. The two parts of Egypt were difficult to hold together, and several times in Egypt's long history there were periods of civil war and political fragmentation, which scholars term the First (2180–2080 B.C.E.) and Second (1640–1570 B.C.E.) Intermediate Periods. Yet the monarchy survived, and in each period a strong warrior-king arose to restore order and expand Egyptian power.

THINKING LIKE A HISTORIAN

Addressing the Gods

Hymns and incantations to the gods are among the earliest written texts in Mesopotamia and Egypt, and sculpture and paintings also often show people addressing the gods. The sources here are examples of such works. What ideas about the gods and the way humans should address them are shared in all these sources, and how do ideas in Egypt differ from those in Mesopotamia?

1 **Enheduana's "Exaltation of Inanna."** Enheduana (2285–2250 B.C.E.), the daughter of Sargon of Akkad, was appointed by her father as high priestess in the Sumerian city of Ur, where she wrote a number of literary and religious works that were frequently recopied long after her death, including this hymn to the goddess Inanna.

■ Your divinity shines in the pure heavens…. Your torch lights up the corners of heaven, turning darkness into light. The men and women form a row for you and each one's daily status hangs down before you. Your numerous people pass before you, as before Utu [the sun-god], for their inspection. No one can lay a hand on your precious divine powers; all your divine powers…. You exercise full ladyship over heaven and earth; you hold everything in your hand. Mistress, you are magnificent, no one can walk before you. You dwell with great An [the god of the heavens] in the holy resting-place. Which god is like you in gathering together … in heaven and earth? You are magnificent, your name is praised, you alone are magnificent!

I am En-hedu-ana, the high priestess of the moon god …. Mercy, compassion, care, lenience and homage are yours, and to cause flood storms, to open hard ground and to turn darkness into light. My lady, let me proclaim your magnificence in all lands, and your glory! Let me praise your ways and greatness! Who rivals you in divinity? Who can compare with your divine rites? … An and Enlil [the chief god of Sumer] have determined a great destiny for you throughout the entire universe. They have bestowed upon you ladyship in the assembly chamber. Being fitted for ladyship, you determine the destiny of noble ladies. Mistress, you are magnificent, you are great! Inanna, you are magnificent, you are great! My lady, your magnificence is resplendent. May your heart be restored for my sake! Your great deeds are unparalleled, your magnificence is praised! Young woman, Inanna, your praise is sweet!

2 **Babylonian cylinder seal showing a man addressing the deities.** Dating from the Old Babylonian period (1800–1600 B.C.E.), this seal shows a man (left) addressing two deities, the one on the right holding the rod and ring, symbols of authority. The cuneiform inscription reads, "Ibni-Amurru, son of Ilima-ahi, servant of the god Amurru."

3 **Pyramid text of King Unas.** This incantation, designed to assist the king's ascent to the heavens after his death, was inscribed on a wall of the royal burial chambers in the pyramid of the Egyptian king Unas (r. 2375–2345 B.C.E.) at Saqqara, a burial ground near the Nile.

Re-Atum [the sun-god], this Unas comes to you,
A spirit indestructible
Who lays claim to the place of the four pillars!
Your son comes to you, this Unas comes to you
May you cross the sky united in the dark,
May you rise in lightland, the place in which you shine!
Osiris, Isis, go proclaim to Lower Egypt's gods
And their spirits:
"This Unas comes, a spirit indestructible,
Like the morning star above Hapy [the god of the flooding of the Nile],
Whom the water-spirits worship;
Whom he wishes to live will live,
Whom he wishes to die will die!"
. . .
Thoth [the god of law and science], go proclaim to the gods of the west
And their spirits:
"This Unas comes, a spirit indestructible,
Decked above the neck as Anubis
Lord of the western height
He will count hearts, he will claim hearts,
Whom he wishes to live will live,
Whom he wishes to die will die!"

4 **Hymn to Aton.** When the pharaoh Akhenaton (r. 1351–1334 B.C.E.) promoted the worship of the sun-god Aton instead of older Egyptian gods, new hymns were written for the pharaoh to sing in honor of the god.

Thou appearest beautifully on the horizon of heaven
Thou living Aton, the beginning of life!
When thou art risen on the eastern horizon,
Thou hast filled every land with thy beauty.
Thou art gracious, great, glistening, and high over every land;
Thy rays encompass the lands to the limit of all that thou hast made …
Thy rays suckle every meadow.
When thou risest, they live, they grow for thee.
Thou makest the seasons in order to rear all that thou hast made,
The winter to cool them,
And the heat that they may taste thee.
Thou hast made the distant sky in order to rise therein,
In order to see all that thou dost make.
While thou wert alone,
Rising in thy form as the living Aton,
Appearing, shining, withdrawing or approaching,
Thou madest millions of forms of thyself alone.
Cities, towns, fields, road, and river —
Every eye beholds thee over against them,
For thou art the Aton of the day over the earth …
Thou art in my heart,
And there is no other that knows thee
Save thy son Nefer-kheperu-Re Wa-en-Re [Akhenaton],
For thou hast made him well versed in thy plans and in thy strength …
Since thou didst found the earth
And raise them up for thy son
Who came forth from thy body:
The king of Upper and lower Egypt, … Akhenaton … and the Chief Wife of the King … Nefertiti, living and youthful forever and ever.

ANALYZING THE EVIDENCE

1. In Source 1 from Mesopotamia, what powers and qualities of the goddess Inanna does Enheduana praise? In Source 2, what qualities do the deities in the cylinder seal exhibit?
2. In Sources 3–5 from Egypt, what powers and qualities does the sun-god exhibit?
3. What common features do you see across all the sources in the powers ascribed to the gods, and the proper attitude of humans in addressing them?
4. Continuing to think about similarities, bear in mind that Enheduana was a member of the ruling dynasty of Akkad, and Unas and Akhenaton were kings of Egypt. How did their social position shape their relationship to the gods?
5. Thinking about differences, how is the relationship of Unas and Akhenaton to the sun-god distinctive?

PUTTING IT ALL TOGETHER

Using the sources above, along with what you have learned in class and in this chapter, write a short essay that compares ideas about the gods in Mesopotamia and Egypt. How do these reflect the physical environment in which these two cultures developed, and how do they reflect their social and political structures?

Egyptian Society and Work

Egyptian society reflected the pyramids that it built. At the top stood the pharaoh, who relied on a circle of nobles, officials, and priests to administer his kingdom. All of them were assisted by scribes, who used a writing system perhaps adapted from Mesopotamia or perhaps developed independently. Egyptian scribes actually created two writing systems: one called hieroglyphics for engraving important religious or political texts on stone or writing them on papyrus made from reeds growing in the Nile Delta, and a much simpler system called hieratic that allowed scribes to write more quickly and was used for the documents of daily life. The cities of the Nile Valley were also home to artisans of all types, along with merchants and other tradespeople. A large group of farmers made up the broad base of the social pyramid.

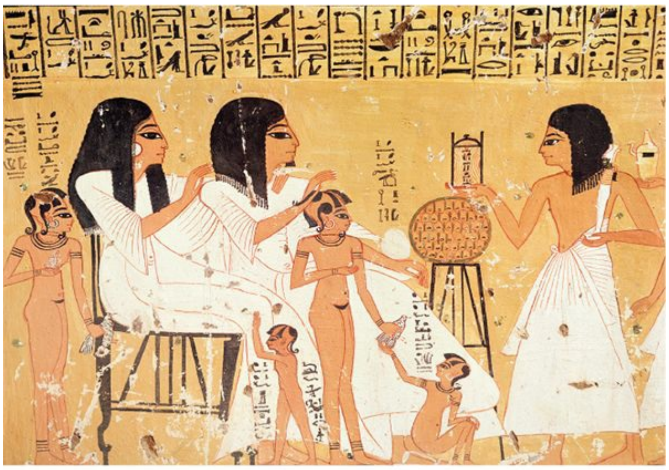
For Egyptians, the Nile formed an essential part of daily life. During the flooding season — from June to October — farmers worked on the pharaoh's building programs and other tasks away from their fields. When the water began to recede, they diverted some of it into ponds for future irrigation and began planting wheat and barley, using plows pulled by oxen or people. From October to February farmers planted and tended crops, and from February until the next flood they harvested them. As in Mesopotamia, common people paid their obligations to their superiors in products and in labor. People's labor obligations in the Old Kingdom may have included forced work on the pyramids and canals, although recent research suggests that most people who built the pyramids were paid for their work. Some young men were drafted into the pharaoh's army, which served as both a fighting force and a labor corps.

The lives of all Egyptians centered around the family. Just as in Mesopotamia, marriage was a business arrangement. A couple's parents arranged the marriage, which seems to have taken place at a young age. Once couples were married, having children, especially sons, was a high priority, as indicated by surviving charms to promote fertility and prayers for successful childbirth. Boys continued the family line, and only they could perform the proper burial rites for their father.

Most Egyptian men had only one wife, but among the wealthy some had several wives or concubines. Ordinary women were expected to obey their fathers, husbands, and other men, but they possessed considerable economic and legal rights. They could own land in their own names, operate businesses, and testify in court. Literature and art depict a world in which ordinary husbands and wives enjoyed each other's company. (See "Analyzing the Evidence: Egyptian Families," page 45.)

ANALYZING THE EVIDENCE

Egyptian Families



Deir el-Medina, Thebes, Egypt/Bridgeman Images

This painting from the tomb of the Egyptian official Inherkau, who lived and worked during the reign of Ramesses III (r. 1184–1153), toward the end of the New Kingdom, shows the deceased and his wife Wabet (left) receiving offerings from their two sons (only one of whom is fully visible in this image),while their grandchildren play around their feet. The children, several holding birds or bird toys, have partly shaved heads and what scholars of Egypt term the “sidelock of youth,” a long braided lock of hair common in Egyptian paintings of children that indicates the child was an heir of the god Osiris. Inherkau oversaw artisans and workers on the royal tombs at Thebes, as had his father and grandfather before him, for which they all carried the splendid title “Foreman of the Lord of the Two Lands in the Place of Truth.” In contrast to Hollywood portrayals of gangs of slaves forced at the end of a lash to build tombs for pharaohs, those who worked on the tombs at Thebes lived in a town nearby with their families and were paid for their work in grain, fish, vegetables, water, wood, meat, beer, and other necessities. Along with constructing the royal tombs, they often made and sold furniture and funerary equipment such as coffins, boxes, statuary, and pottery, adding to their income.

Written records on papyrus and on large pieces of limestone provide evidence about marriage, divorce, land transfers, inheritance, and religious life, and suggest that women carried out many rituals and economic activities independent of a male legal guardian. Corrupt officials sometimes were slow in paying workers, and the reign of Ramesses III saw several strikes by workers for more regular pay. Many craftsmen and officials such as Inherkau built their own underground tombs near Thebes, with burial chambers with vaulted ceilings and wall decorations. Inherkau’s richly decorated burial chamber shows several dozen scenes in addition to this one, which depict gods, the afterlife, mythological events, and the deceased and his family engaged in everyday or religious activities.

QUESTIONS FOR ANALYSIS

1. How does the artist use the size of figures to indicate their status in the family? To suggest that Inherkau’s wife Wabet was important in the household?

2. What message about Egyptian family life does the artist seem to be conveying here, with the combination of children’s play and religious rituals?
3. Both tomb building and showing children with the “sidelock of youth” are practices that began in the Old Kingdom with the pharaoh and his household, but by the New Kingdom had spread to fairly ordinary people such as Inherkau. What does this suggest about Egyptian society?

Migrations, Revivals, and Collapse

While Egyptian civilization flourished in the Nile Valley, various groups migrated throughout the Fertile Crescent and then accommodated themselves to local cultures (Map 2.2). Some settled in the Nile Delta, including a group the Egyptians called Hyksos. Although they were later portrayed as a conquering horde, the Hyksos were actually migrants looking for good land, and their entry into the delta, which began around 1800 B.C.E., was probably gradual and generally peaceful. The newcomers began to worship Egyptian deities and modeled their political structures on those of the Egyptians.

Mapping the Past

MAP 2.2 Empires and Migrations in the Eastern Mediterranean The rise and fall of empires in the eastern Mediterranean were shaped by internal developments, military conflicts, and the migration of peoples to new areas.

ANALYZING THE MAP At what point was the Egyptian empire at its largest? The Hittite Empire? What were the other major powers in the eastern Mediterranean at this time?

CONNECTIONS What were the major effects of the migrations of the Hyksos? Of the late Bronze Age migrations? What clues does the map provide as to why the late Bronze Age migrations had a more powerful impact than those of the Hyksos?

The Hyksos brought with them methods of making bronze that had become common in the eastern Mediterranean by about 2500 B.C.E. (see “Trade and Cross-Cultural Connections” in Chapter 1) and techniques for casting it into weapons that became standard in Egypt. They thereby brought Egypt fully into the Bronze Age culture of the Mediterranean world. The Hyksos also introduced horse-drawn chariots and the composite bow, made of multiple materials for greater strength, which along with bronze weaponry revolutionized Egyptian warfare. The migration of the Hyksos, combined with a series of famines and internal struggles for power, led Egypt to fragment politically in what later came to be known as the Second Intermediate Period.

In about 1570 B.C.E. a new dynasty of pharaohs arose, pushing the Hyksos out of the delta and conquering territory to the south and northeast. These warrior-pharaohs inaugurated what scholars refer to as the New Kingdom, a period characterized not only by enormous wealth and conscious imperialism but also by a greater sense of insecurity because of new contacts and military engagements. By expanding Egyptian power beyond the Nile Valley, the pharaohs created the first Egyptian empire, and they celebrated their triumphs with giant statues and rich tombs on a scale unparalleled since the pyramids of the Old Kingdom.

Hittite Archer in a Chariot In this stylized stone carving made about 1000 B.C.E. in Anatolia (modern-day Turkey), a Hittite archer driven in a chariot shoots toward his foes, while a victim of an earlier shot is trampled beneath the horse's hooves. The arrows might have been tipped with iron, which was becoming a more common material for weapons and tools.

The New Kingdom pharaohs include a number of remarkable figures. Among these was Hatshepsut (haht-SHEP-soot) (r. ca. 1479–ca. 1458 B.C.E.), one of the few female pharaohs in Egypt's long history. (See "Individuals in Society: Hatshepsut and Nefertiti," page 46.) Amenhotep III (ah-men-HOE-tep) (r. ca. 1388–ca. 1350 B.C.E.) corresponded with other powerful kings in Babylonia and other kingdoms in the Fertile Crescent. Amenhotep III was succeeded by his son, who took the name Akhenaton (ah-keh-NAH-tuhn) (r. 1351–1334 B.C.E.). He renamed himself as a mark of his changing religious ideas, choosing to worship a new sun-god, Aton, instead of the traditional Amon or Ra. Akhenaton's wife Nefertiti (nehf-uhr-TEE-tee) supported his religious ideas, but this new religion, imposed from above, failed to find a place among the people, and after his death traditional religious practices returned.

One of the key challenges facing the pharaohs after Akhenaton was the expansion of the kingdom of the Hittites. At about the same time that the Sumerians were establishing city-states, speakers of **Indo-European**

languages migrated into Anatolia, modern-day Turkey. Indo-European is a large family of languages that includes English, most of the languages of modern Europe, ancient Greek, Latin, Persian, Hindi, Bengali, and Sanskrit (for more on Sanskrit, see "The Aryans During the Vedic Age, ca. 1500–500 B.C.E." in Chapter 3). It also includes Hittite, the language of one of the peoples who migrated into this area. Information about the Hittites comes from archaeological sources and also from written cuneiform tablets that provide details about politics and economic life. These records indicate that beginning about 1600 B.C.E. Hittite kings began to conquer more territory (see Map 2.2). As the Hittites expanded southward, they came into conflict with the Egyptians, who were establishing their own larger empire. There were a number of battles, but both sides seem to have recognized the impossibility of defeating the other, and in 1258 B.C.E. the Egyptian king Ramesses II (r. ca. 1290–1224 B.C.E.) and the Hittite king Hattusili III (hah-too-SEE-lee) (r. ca. 1267–1237 B.C.E.) concluded a peace treaty.

Indo-European languages A large family of languages that includes English, most of the languages of modern Europe, ancient Greek, Latin, Persian, Hindi, Bengali, and Sanskrit.

The treaty brought peace between the Egyptians and the Hittites for a time, but this stability did not last. Within several decades of the treaty, groups of seafaring peoples whom the Egyptians called "Sea Peoples" raided, migrated, and marauded in the eastern Mediterranean, disrupting trade and in some cases looting and destroying cities. These raids, combined with the expansion of the Assyrians (see "Assyria, the Military Monarchy"), led to the collapse of the Hittite Empire and the fragmentation of the Egyptian empire. There is evidence of drought, and some scholars have suggested that a major volcanic explosion in Iceland cooled the climate for several years, leading to a series of poor harvests. All of these developments are part of a general "Bronze Age Collapse" in the period around 1200 B.C.E. that historians see as a major turning point.

The political and military story of battles, waves of migrations, and the rise and fall of empires can mask striking continuities in the history of Egypt and its neighbors. Disrupted peoples and newcomers shared practical concepts of agriculture and metallurgy with one another, and wheeled vehicles allowed merchants to transact business over long distances. Merchants, migrants, and conquerors carried their gods and goddesses with them, and religious beliefs and practices blended and changed. Cuneiform tablets, wall inscriptions, and paintings testify to commercial exchanges and cultural accommodation, adoption, and adaptation, as well as war and conquest.

EGYPTIANS UNDERSTOOD THE PHARAOH TO BE the living embodiment of the god Horus, the source of law and morality, and the mediator between gods and humans. The pharaoh’s siblings and children were also viewed as in some ways divine. Because of this, a pharaoh often took his sister or half-sister as one of his wives, a practice that imitated the behavior of the gods in Egyptian mythology. This concentrated divine blood set the pharaonic family apart from other Egyptians (who did not marry close relatives). A pharaoh chose one of his wives to be the “Great Royal Wife,” or principal queen. Often this was a relative, though sometimes it was one of the foreign princesses who married pharaohs to establish political alliances.

The familial connection with the divine allowed a handful of women to rule in their own right in Egypt’s long history. We know the names of four female pharaohs, of whom the most famous was Hatshepsut. She was the sister and wife of Thutmose II and, after he died, served as regent — as adviser and co-ruler — for her young stepson Thutmose III, who was the son of another woman. Hatshepsut sent trading expeditions and sponsored artists and architects, ushering in a period of artistic creativity and economic prosperity. She built one of the world’s great buildings, an elaborate terraced temple at Deir el Bahri, which eventually served as her tomb. Hatshepsut’s status as a powerful female ruler was difficult for Egyptians to conceptualize, and she is often depicted in male dress or with a false beard, thus looking more like the male rulers who were the norm. After her death, Thutmose III tried to destroy all evidence that she had ever ruled, smashing statues and scratching her name off inscriptions, perhaps because of personal animosity and perhaps because he wanted to erase the fact that a woman had once been pharaoh.

Though female pharaohs were very rare, many royal women had power through their position as Great Royal Wives. The most famous was Nefertiti (ca. 1370–1330 B.C.E.), the wife of Akhenaton. Her name means “the perfect (or beautiful) woman has come.” Nefertiti used her position to spread the new religion of the sun-god Aton. Together she and Akhenaton built a new palace at Akhetaten, the present-day Amarna, away from the old centers of power. There they developed the cult of Aton to the exclusion of the traditional deities. Nearly the only literary survivor of their religious belief is the “Hymn to Aton,” which declares Aton to be the only god. It describes Nefertiti as “the great royal consort whom he, Akhenaton, loves. The mistress of the Two Lands, Upper and Lower Egypt.”

Nefertiti is often shown as being the same size as her husband, and in some inscriptions she is performing religious rituals that would normally have been carried out only by the pharaoh. The exact details of her power are hard to determine, however. An older theory held that her husband removed her from power, though there is also speculation that she may have ruled secretly in her own right after his death. Her tomb has long since disappeared, though some scholars believe that an unidentified mummy discovered in 2003 in Egypt’s Valley of the Kings may be

Nefertiti’s.

QUESTIONS FOR ANALYSIS

1. Why might it have been difficult for Egyptians to accept a female ruler?
2. What opportunities do hereditary monarchies such as that of ancient Egypt provide for women? How does this fit with gender hierarchies in which men are understood as superior?

Iron and the Emergence of New States

The Bronze Age Collapse was a time of massive political and economic disruption, but it was also a period of the spread of new technologies, especially iron. Iron is the most common element in the earth, but most iron on or near the earth's surface occurs in the form of ore, which must be smelted at high temperatures to extract the metal. This process was invented independently during the second millennium B.C.E. in several parts of the world, including Anatolia (modern-day Turkey), Nigeria, and most likely southern India. Early iron was too brittle to be of much use, but ironworkers continued to experiment and improve their products, and iron weapons gradually became stronger and cheaper than their bronze counterparts. Thus, in the schema of dividing history into periods according to the main material out of which tools are made (see "Understanding the Early Human Past" in Chapter 1), the **Iron Age** began in about 1100 B.C.E. Iron weapons became important items of trade around the Mediterranean and throughout the Tigris and Euphrates Valleys, and the technology for making them traveled as well.

Ra (not visible in this photograph) on the other. It and others like it were found in the tombs of the king of Kush and suggest ways that Egyptian artistic styles and religious ideas influenced cultures farther up the Nile.

The decline of Egypt allowed new powers to emerge. South of Egypt along the Nile was a region called Nubia, which as early as 2000 B.C.E. served as a conduit of trade through which a variety of products flowed north from sub-Saharan Africa. As Egypt expanded during the New Kingdom, it took over northern Nubia, incorporating it into the growing Egyptian empire. The Nubians adopted many features of Egyptian culture, including Egyptian gods, the use of hieroglyphs, and the building of pyramids. Many Nubians became officials in the Egyptian bureaucracy and officers in the army, and there was significant intermarriage between the two groups.

With the contraction of the Egyptian empire, an independent kingdom, Kush, rose to power in Nubia, with its capital at Napata in what is now Sudan. The Kushites conquered southern Egypt, and in 727 B.C.E. the Kushite king Piye (PIGH) (r. ca. 747–716 B.C.E.) swept through the entire Nile Valley to the delta in the north. United once again, Egypt enjoyed a brief period of peace during which the Egyptian culture continued to influence that of its conquerors. In the seventh century B.C.E. invading Assyrians pushed the Kushites out of Egypt, and the Kushite rulers moved their capital farther up the Nile to Meroë (MER-oh-ee), where they built hundreds of pyramids. Meroë became a center of iron production, exporting iron goods to much of Africa and across the Red Sea and the Indian Ocean to India. Gold and cotton textiles also provided wealth to the Kushite kingdom, which in the third century B.C.E. developed its own alphabet.

While Kush expanded in the southern Nile Valley, another group rose to prominence along the Mediterranean coast of modern Lebanon. These people established the prosperous commercial centers of Tyre (TIRE), Sidon, and Byblos. They were master shipbuilders, and from about 1100 B.C.E. to 700 B.C.E. many of the residents of these cities became the seaborne merchants of the Mediterranean. Their most valued products were purple and blue textiles, from which originated their Greek name, **Phoenicians** (fih-NEE-shuhns), meaning “Purple People.” They also worked bronze and iron, which they shipped processed or as ore, and made and traded glass products, gold, ivory, and other types of rare goods.

Phoenician ships often carried hundreds of jars of wine, and the Phoenicians introduced grape growing to new regions around the Mediterranean, dramatically increasing the amount of wine available for consumption and trade.

Phoenicians People of the prosperous city-states in what is now Lebanon who traded and founded colonies throughout the Mediterranean and spread the phonetic alphabet.

The variety and quality of the Phoenicians’ trade goods generally made them welcome visitors. They established colonies and trading posts throughout the Mediterranean and as far west as the Atlantic coast of modern-day Portugal. The Phoenicians’ voyages brought them into contact with the Greeks, to whom they introduced many aspects of the older and more urbanized cultures of Mesopotamia and Egypt.

Phoenician Settlements in the Mediterranean

The Phoenicians’ overwhelming cultural achievement was the spread of a completely phonetic system of writing — that is, an alphabet (Figure 2.2). Writers of cuneiform and hieroglyphics had developed signs that were used to represent sounds, but these were always used with a much larger number of ideograms. Sometime around 1800 B.C.E. workers in the Sinai Peninsula, which was under Egyptian control, began to use only phonetic signs to write, with each sign designating one sound. This system vastly simplified writing and reading and spread among common people as a practical means of record keeping and communication. Egyptian scribes and officials continued to use hieroglyphics, but the Phoenicians adapted the simpler system for their own language and spread it around the Mediterranean. The Greeks modified this alphabet for their own language, and the Romans later based their alphabet — the script we use to write English today — on Greek. Alphabets based on the Phoenician alphabet were also created in the Persian Empire and formed the basis of Hebrew, Arabic, and various alphabets of South and Central Asia.

The Hebrews

How did the Hebrews create an enduring written religious tradition?

The legacy of another people who took advantage of Egypt's collapse to found an independent state may have been even more far-reaching than that of the Phoenicians. For a period of several centuries, the Hebrews controlled first one and then two small states on the western end of the Fertile Crescent. The Hebrews created a new form of religious belief, a monotheism based on the worship of an all-powerful god they called **Yahweh** (YAH-way). Beginning in the late seventh century B.C.E. the Hebrews began to write down their religious ideas, traditions, laws, advice literature, prayers, hymns, history, and prophecies in a series of books. These were gathered together centuries later to form the Hebrew Bible, which Christians later adopted and termed the "Old Testament" to parallel specific Christian writings in the "New Testament." The Hebrew Bible later became the core of the Hebrews' religion, Judaism, named after Judah, the southern of the two Hebrew kingdoms. Jews today revere these texts, as do many Christians, and Muslims respect them, all of which gives them particular importance.

The Hebrews were nomadic pastoralists who may have migrated into the Nile Delta from the east seeking good land for their herds of sheep and goats. According to the Hebrew Bible, they were enslaved by the Egyptians but were led out of Egypt by a charismatic leader named Moses. The Hebrews settled in the area between the Mediterranean and the Jordan River known as Canaan and were organized into tribes, each tribe consisting of numerous families who thought of themselves as related to one another. They slowly adopted agriculture and, not surprisingly, at times worshipped the agricultural gods of their neighbors. In this they followed the common historical pattern of newcomers by adapting the culture of an older, well-established people.

The Hebrew Exodus and State, ca. 1250–800 B.C.E.

The Bible reports that the greatest danger to the Hebrews came from a group known as the Philistines (FIH-luh-steenz), who migrated to and established a kingdom in Canaan. The Hebrews found a leader in Saul, who with his men fought the Philistines. Saul subsequently established a monarchy over the Hebrew tribes, an event conventionally dated to about 1025 B.C.E. Saul's work was carried on by David of Bethlehem, who captured the city of Jerusalem, which he made the religious and political center of the realm. David's son Solomon (r. ca. 965–925 B.C.E.) launched a building program that the biblical narrative describes as including cities, palaces, fortresses, and roads. The most symbolic of these projects was the Temple of Jerusalem. The Temple of Jerusalem was intended to be the religious heart of the kingdom, a symbol of Hebrew unity and of Yahweh's approval of the Hebrew state.

This state did not last long. At Solomon's death his kingdom broke into political halves. The northern part became Israel, with its capital at Samaria, and the southern half was Judah, with Jerusalem remaining its center. War broke out between the northern and southern halves, and the Assyrians wiped out the northern kingdom in 722 B.C.E. Judah survived numerous invasions until the Babylonians crushed it in 587 B.C.E. The survivors were sent into exile in Babylonia, a period commonly known as the Babylonian Captivity. In 538 B.C.E. the Persian king Cyrus the Great conquered the Babylonians and permitted some forty thousand exiles to return to Jerusalem (see “The Rise and Expansion of the Persian Empire” and “Global Viewpoints: Rulers and Divine Favor for Babylonians and Hebrews,” page 54). They rebuilt the temple, although politically the area was simply part of the Persian Empire.

GLOBAL VIEWPOINTS

Rulers and Divine Favor for Babylonians and Hebrews

In the ancient world, individuals who established large empires through conquest often subsequently proclaimed that their triumph was the result of divine favor, and they honored the gods of the regions they conquered. King Cyrus the Great of Persia appears to have followed this tradition in at least some of his conquests. A text written in cuneiform on a sixth-century-B.C.E. Babylonian clay cylinder presents Cyrus describing the way in which the main Babylonian god, Marduk, selected him to conquer Babylon and restore proper government and worship. Cyrus is also portrayed as divinely chosen in the book of Isaiah in Hebrew Scripture, probably written sometime in the late sixth century B.C.E., after Cyrus allowed the Jews to return to Jerusalem. Here it is mainly the Hebrew god Yahweh who speaks, explaining why he has made Cyrus victorious even though Cyrus is not a Jew.

The Cyrus Cylinder

■ I am Cyrus, king of the universe, the great king, the powerful king, king of Babylon, king of Sumer and Akkad, king of the four quarters of the world….

When I went as harbinger of peace i[nt]o Babylon I founded my sovereign residence within the palace amid celebration and rejoicing. Marduk, the great lord, bestowed on me as my destiny the great magnanimity of one who loves Babylon, and I every day sought him out in awe. My vast troops marched peaceably in Babylon, and the whole of [Sumer] and Akkad had nothing to fear. I sought the welfare of the city of Babylon and all its sanctuaries. As for the population of Babylon, … [w]ho as if without div[ine intention] had endured a yoke not decreed for them, I soothed their weariness, I freed them from their bond…. Marduk, the great lord, rejoiced at [my good] deeds, and he pronounced a sweet blessing over me, Cyrus, the king who fears him, and over Cambyses, the son [my] issue, [and over] all my troops, that we might proceed further at his exalted command.

The Book of Isaiah, Chapter 45

■ Thus said the Lord to Cyrus, His anointed one — whose right hand He has grasped, Treading down nations before him, Ungirding the loins of kings, Opening doors before him, and letting no gate stay shut: I will march before you, and level the hills that loom up; I will shatter doors of bronze and cut down iron bars. I will give you treasures concealed in the dark and secret hoards — So that you may know that it is I the LORD, the God of Israel, who call you by name. For the sake of My servant

Jacob, Israel My chosen one, I call you by name, I hail you by title, though you have not known Me. I am the LORD, and there is none else; beside Me, there is no God. I engird you, though you have not known Me….

It was I who roused him [that is, Cyrus] for victory, and who level all roads for him. He shall rebuild My city, and let My exiled people go, without price and without payment — said the LORD of hosts.

QUESTIONS FOR ANALYSIS

1. How would you compare the portrayal of Cyrus and the balance between divine and human actions in the two texts?
2. The Babylonians were polytheistic, and the Hebrews were monotheistic. How does this shape the way divine actions and favor are portrayed in the texts?
3. Both of these texts have been very influential in establishing the largely positive historical view of Cyrus. What limitations might there be in using these as historical sources?

The Jewish Religion

During and especially after the Babylonian Captivity, the most important Hebrew texts of history, law, and ethics were edited and brought together in the Torah, the first five books of the Hebrew Bible. Fundamental to an understanding of the Jewish religion is the concept of the Covenant, an agreement that people believed to exist between themselves and Yahweh. According to the Bible, Yahweh appeared to the tribal leader Abraham, promising him that he would be blessed, as would his descendants, if they followed Yahweh. (Because Judaism, Christianity, and Islam all regard this event as foundational, they are referred to as the "Abrahamic religions.") Yahweh next appeared to Moses when he was leading the Hebrews out of Egypt, and Yahweh made a covenant with the Hebrews: if they worshipped Yahweh as their only god, he would consider them his chosen people and protect them from their enemies. Individuals such as Abraham and Moses who acted as intermediaries between Yahweh and the Hebrew people were known as "prophets." Much of the Hebrew Bible consists of writings in the prophets' voices, understood as messages from Yahweh to the Hebrews.

Worship was embodied in a series of rules of behavior, the Ten Commandments, which Yahweh gave to Moses; these required certain kinds of religious observances and forbade the Hebrews to steal, kill, lie, or commit adultery, thus creating a system of ethical absolutes. From the Ten Commandments a complex system of rules of conduct was created and later written down as Hebrew law. The later prophets such as Isaiah created a system of ethical monotheism, in which goodness was understood to come from a single transcendent god whom the Hebrews were to worship, and in which religious obligations included fair and just behavior toward other people as well as rituals.

Hebrew Seal Archaeologists found this stone seal in 2012 while unearthing an ancient drainage channel in central Jerusalem. Dating from the seventh or sixth century B.C.E., the tiny seal would have been set in a ring and used for signing letters. The inscription reads, “Belonging to Matanyahu …, ” a name that is found in Hebrew Scripture and is very close to the name of the current prime minister of Israel, Benjamin Netanyahu.

Like Mesopotamian deities, Yahweh punished people, but the Hebrews also believed he would protect them all, not simply kings and powerful priests, and make them prosper if they obeyed his commandments. The religion of the Hebrews was thus addressed to not only the elites but also the individual. Because kings or other political leaders were not essential to its practice, the rise or fall of a kingdom was not crucial to the religion’s continued existence. Religious leaders were important in Judaism, but personally following the instructions of Yahweh was the central task for observant Jews in the ancient world.

Hebrew Society

The Hebrews were originally nomadic, but they adopted settled agriculture in Canaan, and some lived in cities. Over time, communal use of land gave way to family or private ownership, and devotions to the traditions of

Judaism replaced tribal identity.

Family relationships reflected evolving circumstances. Marriage and the family were fundamentally important in Jewish life. Celibacy was frowned upon, and almost all major Jewish thinkers and priests were married. As in Mesopotamia and Egypt, marriage was a family matter, too important to be left solely to the whims of young people. The bearing of children was seen in some ways as a religious function. Sons were especially desired because they maintained the family bloodline while keeping ancestral property in the family. A firstborn son became the head of the household upon his father’s death. Mothers oversaw the early education of the children, but as boys grew older, their fathers provided more of their education.

The development of urban life among Jews created new economic opportunities, especially in crafts and trade. People specialized in certain occupations, and, as in most ancient societies, these crafts were family trades.

The Assyrians and the Persians

How did the Assyrians and the Persians consolidate their power and control the subjects of their empires?

Small kingdoms like those of the Phoenicians and the Jews could exist only in the absence of a major power. In the ninth century B.C.E. one major power arose in the form of the Assyrians, who starting in northern Mesopotamia created an empire through often-brutal military conquests. And from a base in what is now southern Iran, the Persians established an even larger empire, developing effective institutions of government.

Assyria, the Military Monarchy

Starting from a base in northern Mesopotamia around 900 B.C.E., the Assyrians began a campaign of expansion and domination, conquering, exacting tribute, and building new fortified towns, palaces, and temples. By means of almost constant warfare, the Assyrians created an empire that stretched from their capital of Nineveh on the Tigris River to central Egypt. Revolt against the Assyrians inevitably promised the rebels bloody battles and cruel sieges followed by surrender, accompanied by systematic torture and slaughter, and sometimes deportations.

Assyrian Warriors Attack a City In this Assyrian carving from a royal throne room made about 865 B.C.E., warriors cross a river on inflated skins, which both support them and provide air for breathing underwater. Such innovative techniques, combined with a large army and effective military organization, allowed the Assyrians to establish a large empire.

Assyrian methods were certainly harsh, but in practical terms Assyria's success was due primarily to the size of its army and to the army's sophisticated and effective military organization. In addition, the Assyrians developed a wide variety of siege machinery and techniques, including excavations to undermine city walls and battering rams to knock down walls and gates. Never before in this area had anyone applied such technical knowledge to warfare. The Assyrians also knew how to coordinate their efforts, both in open battle and in siege warfare. Not only did the Assyrians know how to win battles, but they also knew how to take advantage of their victories. As early as the eighth century B.C.E., the Assyrian kings began to organize their conquered territories into an empire. The lands closest to Assyria became provinces governed directly by Assyrian officials. Kingdoms beyond the provinces were not annexed but became dependent states.

By the seventh century B.C.E. Assyrian power seemed firmly established. Yet the downfall of Assyria was swift and complete. Babylon won its independence in 626 B.C.E. and joined forces with a new group, the Medes, an Indo-European-speaking people from Persia. Together the Babylonians and the Medes destroyed the Assyrian Empire in 612 B.C.E., paving the way for the rise of the Persians.

The Rise and Expansion of the Persian Empire

As we have seen, Assyria rose to power from a base in the Tigris and Euphrates River Valleys of Mesopotamia, which had seen many earlier empires. The Assyrians were defeated by a coalition that included not only a Mesopotamian power — Babylon — but also a people with a base of power in a part of the world that had not been the site of earlier urbanized states: Persia (modern-day Iran) (Map 2.3).

MAP 2.3 The Assyrian and Persian Empires, ca. 1000–500 B.C.E. The Assyrian Empire at its height around 650 B.C.E. included almost all of the old centers of power in the ancient Near East. By 500 B.C.E., however, the Persian Empire was far larger, extending from the Mediterranean Sea to the Indus River.

Iran's geographical position and topography explain its traditional role as the highway between western and eastern Asia. Nomadic peoples migrating south from the broad steppes of Russia and Central Asia have streamed into Iran throughout much of history. (For an in-depth discussion of these groups, see Chapter 12.) Confronting the uncrossable salt deserts, most have turned either westward or eastward, moving on until they reached the advanced and wealthy urban centers of Mesopotamia and India. Cities did emerge along these routes, however, and Iran became the area where nomads met urban dwellers.

Among these nomads were Indo-European-speaking peoples who migrated into this area about 1000 B.C.E. with their flocks and herds. They were also horse breeders, and the horse gave them a decisive military advantage over those who already lived in the area. One of these groups was the Medes, who settled in northern Iran. With the rise of the Medes, the balance of power in western Asia shifted east of Mesopotamia for the first time.

In 550 B.C.E. Cyrus the Great (r. 559–530 B.C.E.), king of the Persians (another Indo-European-speaking group) and one of the most remarkable statesmen of antiquity, conquered the Medes. Cyrus then set out to win control of the shore of the Mediterranean and thus of the terminal ports of the great trade routes that crossed Iran and Anatolia and to secure eastern Iran from the threats of nomadic invasions. In a series of major campaigns Cyrus achieved both goals, thereby consolidating the Persian Empire, though he ultimately died on the battlefield in eastern Iran.

After his victories, Cyrus made sure the Persians were portrayed as liberators, and in some cases he was more benevolent than most conquerors. According to his own account, he freed all the captive peoples, including the Hebrews, who were living in forced exile in Babylon. He returned the Hebrews' sacred objects to them and allowed those who wanted to do so to return to Jerusalem, where he paid for the rebuilding of their temple. (See "Global Viewpoints: Rulers and Divine Favor for Babylonians and Hebrews," page 54.)

Cyrus's successors continued the Persian conquests, creating the largest empire the world had yet seen. Darius (r. 521–486 B.C.E.) conquered Scythia in Central Asia, along with much of Thrace and Macedonia, areas north of the Aegean Sea (see Map 2.3). Darius began to call himself "King of Kings." Invasions of Greece by Darius and his son Xerxes were unsuccessful, but the Persian Empire lasted another two hundred years, until it became part of the empire of Alexander the Great (see "From Polis to Monarchy, 404–200 B.C.E." in Chapter 5).

The Persians also knew how to preserve the peace they had won on the battlefield. To govern the empire, they created an efficient administrative system based in their newly built capital city of Persepolis. Under Darius, they divided the empire into districts and appointed either Persian or local nobles as administrators called satraps to head each one. The satrap controlled local government, collected taxes, heard legal cases, and maintained order. He was assisted by a council and also by officials and army leaders sent from Persepolis who made sure that he knew the will of the king and that the king knew what was going on in the provinces. The Persians allowed the peoples they conquered to maintain their own customs and beliefs as long as they paid the proper amount of taxes and did not rebel, thus creating a culture that blended older and newer religious traditions and ways of seeing the world. Because Persian art depicted both Persians and non-Persians realistically, it is an excellent source of information about the weapons, tools, clothing, and even hairstyles of many peoples of the area.

Communication and trade were eased by a sophisticated system of roads linking the empire from the coast of Asia Minor to the valley of the Indus River. These roads meant that the king was usually in close touch with officials and subjects, and they simplified the defense of the empire by making it easier to move Persian armies. The roads also aided the flow of trade, which Persian rulers further encouraged by building canals, including one that linked the Red Sea and the Nile.

Most likely, the spot had been a ferry crossing and the objects had been buried long ago.

The Religion of Zoroaster

Persian religion was originally polytheistic and tied to nature, with Ahuramazda (ah-HOOR-uh-MAZ-duh) as the chief god. Around 600 B.C.E. the ideas of Zoroaster (zoh-roh-ASS-tuhr), a thinker and preacher whose dates are uncertain, began to gain prominence. Zoroaster is regarded as the author of key religious texts, which were later gathered together in a collection of sacred texts called the Avesta. He introduced new spiritual concepts, stressing devotion to Ahuramazda alone and emphasizing the individual’s responsibility to choose between the forces of creation, truth, and order and those of nothingness, chaos, falsehood, and disorder. Zoroaster taught that people possessed free will and that they must rely on their own consciences to guide them through an active life in which they focused on “good thoughts, good words, and good deeds.” Their decisions were crucial, he warned, for there would come a time of reckoning. At the end of time, the forces of order would win, and the victorious Ahuramazda, like the Egyptian god Osiris, would preside over a last judgment to determine each person’s eternal fate.

Zoroaster’s writings were communicated by teachers, and King Darius began to use Zoroastrian language and images. Under the protection of the Persian kings, Zoroastrian ideas spread throughout Iran and the rest of the Persian Empire, and then into central China. **Zoroastrianism** survived the fall of the Persian Empire to influence Christianity, Islam, and Buddhism, largely because of its belief in a just life on earth and a happy afterlife. Good behavior in the world, even though unrecognized at the time, would receive ample reward in the hereafter. Evil, no matter how powerful a person had been in life, would be punished after death. In some form or another, Zoroastrian concepts still pervade many modern religions, and Zoroastrianism still exists as a religion.

Zoroastrianism Religion based on the teachings of Zoroaster that emphasized the individual’s responsibility to choose between good and evil.

Chapter Summary

Beginning about 5,000 years ago, people in some parts of the world invented writing, in large part to meet the needs of the state. States first developed in the southern part of Mesopotamia known as Sumer, where priests and rulers invented ways to control and organize people who lived in cities reliant on irrigation. Conquerors from the north unified Mesopotamian city-states into larger empires and spread Mesopotamian culture over a large area.

During the third millennium B.C.E. Egypt grew into a cohesive state under a single ruler. For long stretches of history, Egypt was prosperous and secure in the Nile Valley, although at times various groups migrated into or invaded and conquered this kingdom. During the period known as the New Kingdom, warrior-kings created a large Egyptian empire. After the collapse of the New Kingdom, the Nubian rulers of Kush conquered Egypt, and another group, the Phoenicians, came to dominate trade in the Mediterranean, spreading a letter alphabet. Another group, the Hebrews, created a new form of religious belief based on the worship of a single all-powerful god.

In the ninth century B.C.E. the Assyrians used a huge army and sophisticated military tactics to create an empire from a base in northern Mesopotamia. The Persians established an even larger empire, developing effective institutions of government and building roads. The Persians generally allowed their subjects to continue their own customs, traditions, and religions. Around 600 B.C.E. a new religion grew in Persia based on the teachings of the prophet Zoroaster.

CONNECTIONS

“History is written by the victors” goes a common saying often incorrectly attributed to British prime minister Winston Churchill, who led Britain during World War II. This is not always true; people who have been vanquished in wars or devastated by oppression have certainly made their stories known. But in other ways it is always true, for writing created records and therefore was the origin of what many people understand as history. Writing was invented to serve the needs of people who lived close to one another in cities and states, and almost everyone who could write lived in states. Because most written history, including this book, concentrates on areas with states and complex societies, the next two chapters examine the societies that were developing in India and China during the period discussed in this chapter. In Chapter 5 we pick up on developments in the Mediterranean that link to those in Mesopotamia, Egypt, and Persia discussed in this chapter.

It is important to remember that, as was the spread of agriculture, the growth of the state was a slow process. States became the most powerful and most densely populated forms of human society, and today almost everyone on the planet is at least hypothetically a citizen of a state or, as we now call them, nation (or sometimes of more than one, if he or she has dual citizenship). Just three hundred years ago, however, only about a third of the world was governed by states; in the rest of the world, people lived in bands of foragers, villages led by kin leaders, family groups of pastoralists, chiefdoms, confederations of tribes, or other forms of social organization. In 500 B.C.E. perhaps only a little over 5 percent of the world's population lived in states.

The first inquiries into the past in the West were written at just about this time, by the Greek writer Herodotus (heh-ROD-duh-tuhs) (ca. 484–ca. 425 B.C.E.), who used the word *historia* to describe them, from which we get the word *history*. In his histories, Herodotus pays primary attention to the Persians and the Greeks, both of whom had writing and states, but he also discusses many peoples who had neither. In their attempts to provide a balanced account of all the world's peoples, not just those who lived in places where writing developed, historians today are also looking beyond written sources. Those sources invariably present only part of the story, as Winston Churchill — a historian as well as a political leader — noted in something he actually *did* say: "History will bear me out, particularly as I shall write that history myself."

CHAPTER 2 Review and Explore

Identify Key Terms

Identify and explain the significance of each item below.

polytheism (p. 35)
cuneiform (p. 35)
epic poem (p. 37)
Hammurabi’s law code (p. 39)
pharaoh (p. 42)
Indo-European languages (p. 44)
Iron Age (p. 48)
Phoenicians (p. 48)
Yahweh (p. 49)
Zoroastrianism (p. 55)

Review the Main Ideas

Answer the focus questions from each section of the chapter.

1. How does writing shape what we can know about the past, and how did writing develop to meet the needs of cities and states? (p. 32)
2. How did the peoples of Mesopotamia form states and develop new technologies and institutions? (p. 34)
3. How did the Egyptians create a prosperous and long-lasting society? (p. 39)
4. How did the Hebrews create an enduring written religious tradition? (p. 49)
5. How did the Assyrians and the Persians consolidate their power and control the subjects of their empires? (p. 51)

Make Comparisons and Connections

Analyze the larger developments and continuities within and across chapters.

1. Thinking about continuities, as well as change, what aspects of life in the Neolithic period continued with little change in the states of Mesopotamia and Egypt? What were the most important differences?
2. Most peoples in the ancient world gained influence over others and became significant in history through military conquest and the establishment of states and empires. By contrast, how did the Phoenicians and the Hebrews shape the development of world history? What does this suggest about the importance of cultural as well as political developments in world history?
3. How were the empires that developed in Mesopotamia, Egypt, and Persia

similar to one another? Which of the characteristics you have identified as a similarity do you predict will also be found in later empires, and why?

Female Spirit from an Indian Stupa

Royal patronage aided the spread of Buddhism in India, especially the patronage of King Ashoka, who sponsored the construction of numerous Buddhist monuments. This head of a female spirit

(called a *yakshini*) is from the stupa that Ashoka had built at Bharhut in central India.

During the centuries when the peoples of ancient Mesopotamia and Egypt were developing urban civilizations, people in India were wrestling with the same challenges — food production, building of cities, political administration, and questions about human life and the cosmos. Like the civilizations of the Nile River Valley and southwestern Asia, the earliest Indian civilization centered on a great river, the Indus. From about 2800 B.C.E. to 1800 B.C.E., the Harappan culture thrived and expanded over a huge area.

A very different Indian society emerged after the decline of this civilization. It was dominated by the Aryans, warriors who spoke an early version of Sanskrit. The Indian caste system and the Hindu religion, key features of Indian society that continued into modern times, had their origins in early Aryan society. By the middle of the first millennium B.C.E., the Aryans had set up numerous small kingdoms throughout north India. This was the great age of Indian religious creativity, when Buddhism and Jainism were founded and the early Brahmanic religion of the Aryans developed into Hinduism.

The first major Indian empire, the Mauryan Dynasty, emerged in the wake of the Greek invasion of north India in 326 B.C.E. This dynasty reached its peak under King Ashoka, who actively promoted Buddhism both within his realm and beyond it. Not long after his reign, however, the empire broke up, and for several centuries India was politically divided. Although India never had a single language and only periodically had a centralized government, cultural elements dating back to the ancient period — the core ideas of Brahmanism, the caste system, and the early epics — spread through trade and other contact, even when the subcontinent was divided into competing kingdoms.

What does archaeology tell us about the Harappan civilization in India?

The subcontinent of India, a landmass as large as western Europe, juts southward into the warm waters of the Indian Ocean. Today this region is divided into the separate countries of Pakistan, Nepal, India, Bangladesh, and Sri Lanka, but these divisions are recent, and for this discussion of premodern history, the entire subcontinent will be called India.

In India, as elsewhere, the possibilities for both agriculture and communication have always been shaped by geography. Most areas in India are warm all year, with average temperatures ranging from 79°F in the north to 85°F in the south. Monsoon rains sweep northward from the Indian Ocean each summer. The lower reaches of the Himalaya Mountains in the northeast are covered by dense forests. Immediately to the south are the fertile valleys of the Indus and Ganges Rivers. These lowland plains, which stretch all the way across the subcontinent, were tamed for agriculture over time, and India's great empires were centered there. To their west are the deserts of Rajasthan and southeastern Pakistan, historically important in part because their flat terrain enabled invaders to sweep into India from the northwest. South of the great river valleys rise the jungle-clad Vindhya Mountains and the dry, hilly Deccan Plateau. Only along the western coast of this part of India do the hills give way to narrow plains where crop agriculture flourished (see Map 3.2, page 78). India's long coastlines and predictable winds fostered maritime trade with other countries bordering the Indian Ocean.

Agriculture was well established in India by about 7000 B.C.E. Wheat and barley were the early crops, probably having spread in their domesticated form from what is today the Middle East. Farmers also domesticated cattle, sheep, and goats and learned to make pottery.

The story of the first civilization in India is one of the most dramatic in the ancient world. From the Bible, people knew about ancient Egypt and Sumer for centuries, but it was not until 1921 that archaeologists found astonishing evidence of a thriving and sophisticated Bronze Age urban culture dating to about 2500 B.C.E. at Mohenjo-daro in what is now Pakistan. Since 1921 thousands of additional sites of this **Harappan** (huh-RAH-puhn) civilization have been found in both India and Pakistan. (See "Thinking Like a Historian: Harappan Artifacts," page 64.)

Harappan The first Indian civilization; also known as the Indus Valley civilization.

Stone Figure of a Man from Mohenjo-daro This small stone figure, about 7 inches tall, is thought to depict a priest-king. The man’s beard is carefully trimmed and his upper lip is shaved. The headband and armband have circular ornaments, probably once filled with colored paste. His robe with its trefoil designs was probably also filled with colors to suggest the fabric more vividly.

Harappan civilization extended over a vast area and evolved over a period of nearly a millennium (Map 3.1). It extended over nearly five hundred thousand square miles in the Indus Valley, making it more than twice as large as ancient Egypt or Sumer. Yet Harappan civilization was marked by striking uniformity in the layout and construction of towns. Figurines of pregnant women have been found throughout the area, suggesting common religious ideas and practices. It was a literate civilization, like those of Egypt and Mesopotamia, but its script has not yet been deciphered.

MAP 3.1 Harappan Civilization, ca. 2500 B.C.E.
The earliest civilization in India developed in the Indus River Valley in the west of the subcontinent.

Like Mesopotamian cities, Harappan cities were centers for crafts and trade and were surrounded by extensive farmland. Craftsmen produced ceramics decorated with geometric designs. The Harappans were the earliest known manufacturers of cotton cloth, and this cloth was so abundant that goods were wrapped in it for shipment. Trade was extensive. As early as the reign of Sargon of Akkad in the third millennium B.C.E. (see “Empires in Mesopotamia” in Chapter 2), trade between India and Mesopotamia carried goods and ideas between the two cultures, probably by way of the Persian Gulf. The Harappan port of Lothal had a stone dock 700 feet long, next to which were massive granaries and bead-making factories.

The cities of Mohenjo-daro in southern Pakistan, and Harappa, some 400 miles to the north, were huge for this period, more than 3 miles in circumference, with populations estimated at 35,000 to 40,000. Both were defended by great citadels that towered 40 to 50 feet above the surrounding plain. The cities, with their straight streets, had obviously been planned and built before being settled — they were not the outcomes of villages that grew and sprawled haphazardly. The houses were substantial, many two stories tall, some perhaps three. The focal point of a house was a central courtyard onto which the rooms opened.

Perhaps the most surprising aspect of the elaborate planning of these cities was their complex system of drainage. Each house had a bathroom with a drain connected to brick-lined sewers located under the major streets. Openings allowed the refuse to be collected, probably to be used as fertilizer on nearby fields. No other ancient city had such an advanced sanitation system.

Both Mohenjo-daro and Harappa also contained numerous large structures, which archaeologists think were public buildings. One of the most important was the large ventilated storehouse for the community's grain. Mohenjo-daro also had a marketplace or place of assembly, a palace, and a huge pool some 39 feet long by 23 feet wide by 8 feet deep, thought by some to have been used for ritual purification. In contrast to ancient Egypt and Mesopotamia, no great tombs have been discovered in Harappa, making it more difficult to envision the life of the elite.

The prosperity of the Indus civilization depended on constant and intensive cultivation of the rich river valley. Although rainfall seems to have been greater than in recent times, the Indus, like the Nile, flowed through a relatively dry region made fertile by annual floods and irrigation. And as in Egypt, agriculture was aided by a long, hot growing season and near-constant sunshine.

Because no one has yet deciphered the written language of the Harappan people, their political, intellectual, and religious life is largely unknown. There clearly was a political structure with the authority to organize city planning and facilitate trade, but we do not even know whether there were hereditary kings.

Soon after 2000 B.C.E., the Harappan civilization mysteriously declined, with people leaving the cities to live in rural villages. The decline cannot be attributed to the arrival of powerful invaders, as was once thought. Rather it was internally generated. Some scholars suspect an environmental crisis, perhaps a severe drought, an earthquake that led to a shift in the course of the river, or a buildup of salt and alkaline in the soil until they reached levels toxic to plants. Others speculate that long-distance commerce collapsed, leading to an economic depression. Yet others theorize that the population fell prey to diseases, such as malaria, that caused people to flee the cities.

After the Harappan cities were abandoned, for the next thousand years India had no large cities, no kiln-fired bricks, and no written language.

THINKING LIKE A HISTORIAN

Harappan Artifacts

Since 1921 thousands of ancient settlements have been found in the region of the Indus River in modern India and Pakistan dating to the period from 2600 to 1900 B.C.E. Five of these are large cities, located hundreds of miles apart. The cities had obviously been planned and built before being settled; they were not the outcomes of villages that grew and sprawled haphazardly. There are signs of extensive trade, some of it over long distances. After thriving for centuries, these cities and smaller ones as well were largely abandoned, with their residents moving into villages, for reasons not yet known for sure.

1 **Brick ruins of Mohenjo-daro.** Throughout the Harappan area, bricks were made to standard proportions (4:2:1). Cites were built on grids, with straight streets extending north to south and east to west. The city of Mohenjo-daro, shown here, was more than 3 miles in circumference and included a large ventilated storehouse for the community’s grain, and a huge bath, seen here. Made with kiln-fired bricks, the bath is 39 feet long, 23 feet wide, and 8 feet deep.

2 **Harappan jewelry.** Jewelry found in Harappan sites makes much use of gold and precious stones. Necklaces and bracelets are particularly common.

National Museum of India, New Delhi, India/Bridgeman Images

3 **Inscribed seals.** Several thousand seals have been found with symbols inscribed on them, assumed to represent words, but no one has been able to decipher them. Like in the Sumer, seals were used to impress clay tablets, but the symbols have no connection to Sumerian cuneiform. These four seals are thought to depict a bull, a rhinoceros, an elephant, and a tiger.

4 **Figurine.** Figurines of women have been found throughout the Harappan area, often adorned with jewelry, as this one is. By contrast, figurines of men are rare.

ANALYZING THE EVIDENCE

1. What can be inferred from the straight lines and uniform-sized bricks in the ruins of Mohenjo-daro in Source 1? Can you recognize the walls of buildings? What else do you see?
2. Does the gold and precious stone jewelry in Source 2 seem distinctly Harappan, or are similar types of personal ornaments found in other cultures? What sort of use could have been made of the three smaller objects?
3. What use do you think was made of figurines of women like the one in Source 4? Do you think they were used as children's toys? Or could they have had a religious significance, perhaps as symbols of fertility? Do you know of similar objects found in any other early civilizations?
4. Archaeologists have taken the evidence from brick ruins, seals, figurines, and jewelry, such as those in Sources 1–4, to propose hypotheses about the religion, social structure, or political organization of Harappan society. How should we assess their arguments? What would be the strengths and weak points?

PUTTING IT ALL TOGETHER

Using the sources above, along with what you have learned in class and in this chapter, write a short essay that analyzes the evidence for Harappan civilization. What can be said with confidence on the basis of the evidence? What must remain speculation?

The Aryans During the Vedic Age, ca. 1500–500 B.C.E.

What kind of society and culture did the Indo-European Aryans create?

After the decline of the Harappan civilization, a people who called themselves **Aryans** became dominant in north India. They were speakers of an early form of Sanskrit, an Indo-European language closely related to ancient Persian and more distantly related to Latin, Greek, Celtic, and their modern descendants, such as English. For example, the Sanskrit *nava*, "ship," is related to the English word *naval*; *deva*, "god," to *divine*; and *raja*, "ruler," to *regal*. The word *Aryan* itself comes from *Arya*, "noble" or "pure" in Sanskrit, and has the same linguistic root as *Iran* and *Ireland*. The Aryans flourished during the Vedic Age (ca. 1500–500 B.C.E.). Named for the Vedas, a large and significant body of ancient sacred works written in Sanskrit, this period witnessed the Indo-Aryan development of the caste system and the Brahmanic religion and the writing of the great epics that represent the earliest form of Indian literature.

Aryans The dominant people in north India after the decline of the Indus Valley civilization; they spoke an early form of Sanskrit.

Aryan Dominance in North India

Until relatively recently, the dominant theory was that the Aryans came into India from outside, perhaps as part of the same movements of people whereby the Hittites occupied parts of Anatolia, the Achaeans entered Greece, and the Kassites conquered Sumer — all in the period from about 1900 B.C.E. to 1750 B.C.E. Some scholars, however, have proposed that the Indo-European languages spread to this area much earlier; to them it seems possible that the Harappan people were speakers of an early Indo-European language. If that was the case, the Aryans would be one of the groups descended from this early population.

Indo-European Migrations and the Vedic Age

Modern politics complicates analysis of the appearance of the Aryans and their role in India's history. Europeans in the eighteenth and nineteenth centuries developed the concept of Indo-European languages, and they did so in an age both highly conscious of race and in the habit of identifying races with languages. The racist potential of the concept was exploited by the Nazis, who glorified the Aryans as a superior race. Even in less politicized contexts, the notion of a group of people who entered India from outside and made themselves its rulers is troubling to many. Does it mean that the non-Aryans are the true Indians? Does it add legitimacy to those who in later times conquered India from outside? Does it justify or undermine the caste system? One of the difficulties faced by scholars who wish to take a dispassionate view of these issues is that the evidence for the earlier Harappan culture is entirely archaeological, while the evidence for the Aryans is almost entirely based on linguistic analysis of modern languages and orally transmitted texts of uncertain date.

The central source of information on the early Aryans is the ***Rig Veda***, the earliest of the Vedas, originally an oral collection of hymns, ritual texts, and philosophical treatises composed in Sanskrit between 1500 B.C.E. and 500 B.C.E. Like Homer's epics in Greece, which were written in the same period (see "The 'Dark Age' " in Chapter 5), these texts were transmitted orally. They portray the Aryans as warrior tribes who glorified military skill and heroism; loved to drink, hunt, race, and dance; and counted their wealth in cattle. The Aryans did not sweep across India in a quick campaign, nor were they a disciplined army led by one conqueror. Rather they were a collection of tribes that frequently fought with each other and only over the course of several centuries came to dominate north India. (See "Global Viewpoints: Divine Martial Prowess in India and

Sumer,” above.)

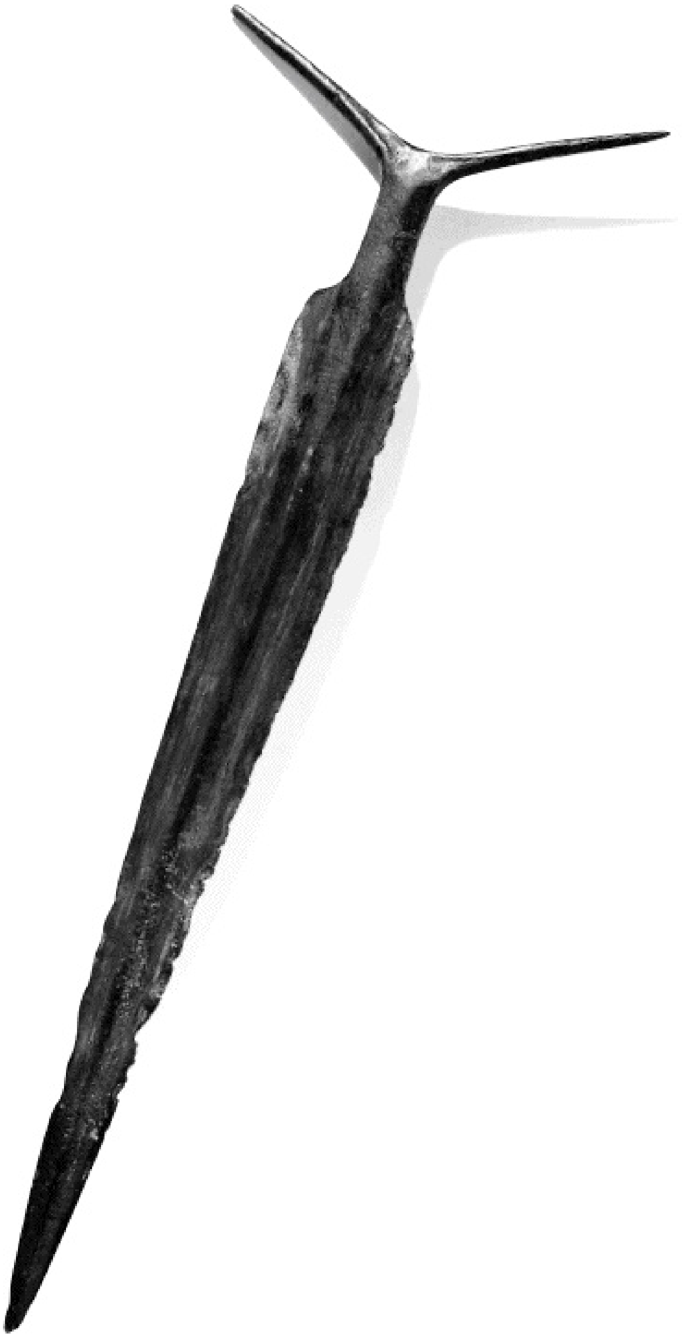
Earthenware Horse Figurines The Aryans were great horsemen, perhaps explaining the inclusion of these models of horses in a tomb in north India during the Vedic period.

Rig Veda The earliest collection of Indian hymns, ritual texts, and philosophical treatises, it is the central source of information on early Aryans.

The key to the Aryans’ success probably lay in their superior military technology. Those they fought often lived in fortified towns and put up a strong defense against them, but Aryan warriors had superior technology, including two-wheeled chariots, horses, and bronze swords and spears. Their epics present the struggle for north India in religious terms, describing their chiefs as godlike heroes and their opponents as irreligious savages who did not perform the proper sacrifices. In time, however, the Aryans clearly absorbed much from those they conquered, such as agricultural techniques and foods.



© The Trustees of the British Museum/Art Resource, NY

Bronze Sword This bronze sword, with a rib in the middle of the blade for strength, is a striking example of the quality of Aryan arms. Superior weapons gave the Aryans military advantage.

At the head of each Aryan tribe was a chief, or raja (RAH-juh), who led his followers in battle and ruled them in peacetime. The warriors in the tribe elected the chief for his military skills. Next in importance to the chief was the priest. In time, priests evolved into a distinct class possessing precise knowledge of complex rituals and of the invocations and formulas that accompanied them, rather like the priest classes in ancient Egypt, Mesopotamia, and Persia. Below them in the pecking order was a warrior nobility who rode into battle in chariots and perhaps on horseback. The warrior class met at assemblies to reach decisions and advise the raja. The common tribesmen tended herds and worked the land. To the conquered non-Aryans fell the drudgery of menial tasks. It is difficult to define precisely their social status. Though probably not slaves, they were certainly subordinate to the Aryans and worked for them in return for protection.

Over the course of several centuries, the Aryans pushed farther east into the valley of the Ganges River, at that time a land of thick jungle populated by aboriginal forest peoples. The tremendous challenge of clearing the jungle was made somewhat easier by the introduction of iron around 1000 B.C.E., probably by diffusion from Mesopotamia.

As Aryan rulers came to dominate large settled populations, the style of political organization changed from tribal chieftainship to territorial kingship. In other words, the ruler now controlled an area with people living in permanent settlements, not a nomadic tribe that moved as a group. Moreover, kings no longer needed to be elected by the tribe; it was enough to be invested by priests and to perform the splendid royal ceremonies they designed. The priests, or **Brahmins**, supported the growth of royal power in return for royal confirmation of their own power and status. The Brahmins also served as advisers to the kings. In the face of this royal-priestly alliance, the old tribal assemblies of warriors withered away. By the time Persian armies reached the Indus around 513 B.C.E., there were sixteen major Aryan kingdoms in north India.

Brahmins Priests of the Aryans; they supported the growth of royal power in return for royal confirmation of their own religious rights, power, and status.

GLOBAL VIEWPOINTS

Divine Martial Prowess in India and Sumer

Depictions of heroic military leaders and their interactions with their closest followers are found in the literature of many early societies. Sometimes the closest followers had once been opponents but were won over after recognizing the victor's strength and courage. In India, one of the documents recounting such heroes is the *Rig Veda*, a collection of hymns that is the best source of information about the early Aryans. In the excerpt that follows, Indra, the king of the gods, boasts of his might to a band of fighters. It can be compared to the second document, from the Sumerian *Epic of Gilgamesh*, which describes how Enkidu became a follower of Gilgamesh after being defeated by him in hand-to-hand combat.

"Indra and the Maruts" from the *Rig Veda*

■ [*Maruts:*] "Indra, where are you coming from, all alone though you are so mighty? What is your intention, true lord? Will you make a pact with us, now that you have met us in our finery? Master of bay horses, tell us what your purpose is for us." …

[*Indra:*] "Where was that independent spirit of yours, Maruts, when you left me all alone in the fight with the dragon? *I* was the one, fierce and strong and mighty, who bent aside the lethal weapons of every enemy with my own weapons."

[*Maruts:*] "You did much with us as allies, with our many powers yoked in common, O bull…."

[*Indra:*] "*I* killed Vritra, O Maruts, by my Indra-power, having grown strong through my own glorious rage. With the thunderbolt on my arm I made these all-luminous waters move well for man."

[*Maruts:*] "No one can overcome your power, generous Indra; no one your equal is known to exist among the gods; no one being born now or already born could get such power. Do the things you will do, as you have grown strong."

[*Indra:*] "Even when I am alone, my formidable power must be vast; whatever I boldly set out to do, I do. For I am known as terrible, O Maruts; whatever I set in motion, Indra himself is master of that. Your praise has made me rejoice, lordly Maruts, the sacred chant worthy of hearing that you made here for me — for Indra the bull, the good fighter."

"Enkidu and Gilgamesh" from the *Epic of Gilgamesh*

■ [Enkidu said,] "I will go to the place where Gilgamesh lords it over the people, I will challenge him boldly, and I will cry aloud in Uruk, 'I have come to change the old order, for I am the strongest here.' " …

He entered Uruk, that great market, and all the folk thronged round him where he stood in the street in strong-walled Uruk. The people jostled; speaking of him they said, "He is the spit of Gilgamesh." "He is shorter." "He is bigger of bone." "This is the one who was reared on the milk of wild beasts. His is the greatest strength." The men rejoiced: "Now Gilgamesh has met his match. This great one, this hero whose beauty is like a god, he is a match even for Gilgamesh."

In Uruk the bridal bed was made, fit for the goddess of love. The bride waited for the bridegroom, but in the night Gilgamesh got up and came to the house. Then Enkidu stepped out, he stood in the street and blocked the way. Mighty Gilgamesh came on and Enkidu met him at the gate. He put out his foot and prevented Gilgamesh from entering the house, so they grappled, holding each other like bulls. They broke the doorposts and the walls shook, they snorted like bulls locked together. They shattered the doorposts and the walls shook. Gilgamesh bent his knee with his foot planted on the ground and with a turn Enkidu was thrown. Then immediately his fury died. When Enkidu was thrown he said to Gilgamesh, "There is not another like you in the world. Ninsun, who is as strong as a wild ox in the byre, she was the mother who bore you, and now you are raised above all men, and [the god] Enlil has given you the kingship, for your strength surpasses the strength of men." So Enkidu and Gilgamesh embraced and their friendship was sealed.

QUESTIONS FOR ANALYSIS

1. In what ways do Indra and Gilgamesh resemble each other?
2. As works of literature, what do these two selections have in common?

Life in Early India

Caste was central to the social life of these north Indian kingdoms. Early Aryan society had distinguished among the warrior elite, the priests, ordinary tribesmen, and conquered subjects. These distinctions gradually evolved into the **caste system**, which divided society into strictly defined hereditary groups. Society was conceived of as four hierarchical strata whose members did not eat with or marry each other. These strata, or varnas, were Brahmin (priests), Kshatriya (KSHAT-tree-ya) (warriors and officials), Vaishya (VIGH-sha) (merchants), and Shudra (peasants and laborers). The caste system allowed the numerically outnumbered Aryans to maintain dominance over their subjects and not be culturally absorbed by them.

caste system The Indian system of dividing society into hereditary groups whose members interacted primarily within the group, and especially married within the group.

Social and religious attitudes supported the caste system. Aryans considered the work of artisans impure. They left all such work to the local people, who were probably superior to them in these arts anyway. Trade, by contrast, was not viewed as demeaning. Brahmanic texts of the period refer to trade as equal in value to farming, serving the king, or being a priest.

In the *Rig Veda*, the caste system is attributed to the gods:

> When they divided [the primeval man], into how many different portions did they arrange him? What became of his mouth, what of his two arms? What were his two thighs and his two feet called?
> His mouth became the brahman, his two arms was made into the [kshatriya]; his two thighs became the vaishyas, of his two feet the shudra was born.[1]

As priests, the Brahmins were expected to memorize every syllable and tone of the Vedas so that their rituals would please the gods. They not only conducted the traditional ceremonies but also developed new ones for new circumstances. As agriculture became more important to the Aryans, for example, Brahmins acted as agents of Agni, the god of fire, to purify the land for crops. The Brahmins also knew the formulas and spells that were effective against diseases and calamities.

Those without places in the four varnas — that is, newly conquered peoples and those who had lost their caste status through violations of ritual — were outcastes. That simply meant that they belonged to no caste. In time, some of them became "untouchables" because they were "impure." They were scorned because they earned their living by performing such "polluting" jobs as slaughtering animals and dressing skins.

Slavery was a feature of early social life in India, as it was in Egypt, Mesopotamia, and elsewhere in antiquity. People captured in battle often became slaves, but captives could also be ransomed by their families. At birth, slave children automatically became the slaves of their parents' masters. Indian slaves could be bought, used as collateral, or given away. At the same time, a clever, hard-working, or fortunate slave could buy his and his family's way out of slavery.

Like most nomadic tribes, the Aryans were patrilineal and patriarchal (tracing descent through males and placing power in the senior men of the family). Thus the roles of women in Aryan society probably were more subordinate than were the roles of women in the cultures of south India, many of which were matrilineal (tracing descent through females). But even in Aryan society women were treated somewhat more favorably than in later Indian society. They were not yet given in child-marriage, and widows had the right to remarry. In epics such as the *Ramayana*, women are often portrayed as forceful personalities, able to achieve their goals both by using feminine ploys to cajole men and by direct action. (See "Analyzing the Evidence: Conversations Between Rama and Sita from the *Ramayana*," page 70.)

ANALYZING THE EVIDENCE

Conversations Between Rama and Sita from the *Ramayana*

The *Ramayana*, an epic poem of about fifty thousand verses, is attributed to the third-century-B.C.E. poet Valmiki. Its main character, Rama, the oldest son of a king, is an incarnation of the great god Vishnu. As a young man, he wins the princess Sita as his wife when he alone among her suitors proves strong enough to bend a huge bow. Rama and Sita love each other deeply, but court intrigue disturbs their happy life. After the king announces that he will retire and consecrate Rama as his heir, the king's beautiful junior wife, wishing to advance her own son, reminds the king that he has promised her a favor of her choice. She then asks him to appoint her son heir and to send Rama into the wilderness for fourteen years. The king is forced to consent, and Rama obeys his father.

The passage below gives the conversations between Rama and Sita after Rama learns he must leave. In subsequent parts of the very long epic, the lovers undergo many other tribulations, including Sita's abduction by the lord of the demons, the ten-headed Ravana, and her eventual recovery by Rama with the aid of monkeys.

The *Ramayana* eventually appeared in numerous versions in all the major languages of India. Hearing it recited was said to bring religious merit. Sita, passionate in her devotion to her husband, has remained the favorite Indian heroine. Rama, Sita, and the monkey Hanuman are cult figures in Hinduism, with temples devoted to their worship.

■ "For fourteen years I must live in Dandaka, while my father will appoint Bharata prince regent. I have come to see you before I leave for the desolate forest. You are never to boast of me in the presence of Bharata. Men in power cannot bear to hear others praised, and so you must never boast of my virtues in front of Bharata.... When I have gone to the forest where sages make their home, my precious, blameless wife, you must earnestly undertake vows and fasts. You must rise early and worship the gods according to custom and then pay homage to my father Dasaratha, lord of men. And my aged mother Kausalya, who is tormented by misery, deserves your respect as well, for she has subordinated all to righteousness. The rest of my mothers, too, must always receive your homage.... My beloved, I am going to the great forest, and you must stay here. You must do as I tell you, my lovely, and not give offense to anyone."

So Rama spoke, and Sita, who always spoke kindly to her husband and deserved kindness from him, grew angry just because she loved him, and said, "My lord, a man's father, his mother, brother, son, or daughter-in-law all experience the effects of their own past deeds and suffer an individual fate. But a wife, and she alone, bull among men, must share her husband's fate. Therefore I, too, have been ordered to live in the forest. It is not her father or mother, not her son or friends or herself, but her husband, and he alone, who gives a woman permanent refuge in this world and after death. If you must leave this very day for the trackless forest, Rama, I will go in front of you, softening the thorns and sharp *kusa* grass. Cast out your anger and resentment, like so much water left after drinking one’s fill. Do not be reluctant to take me, my mighty husband. There is no evil in me. The shadow of a husband’s feet in any circumstances surpasses the finest mansions, an aerial chariot, or even flying through the sky…. O Rama, bestower of honor, you have the power to protect any other person in the forest. Why then not me? …

“If I were to be offered a place to live in heaven itself, Rama, tiger among men, I would refuse it if you were not there. I will go to the trackless forest teeming with deer, monkeys, and elephants, and live there as in my father’s house, clinging to your feet alone, in strict self-discipline. I love no one else; my heart is so attached to you that were we to be parted I am resolved to die. Take me, oh please grant my request. I shall not be a burden to you.” …

When Sita finished speaking, the righteous prince, who knew what was right and cherished it, attempted to dissuade her….

“Sita, give up this notion of living in the forest. The name ‘forest’ is given only to wild regions where hardships abound…. There are lions that live in mountain caves; their roars are redoubled by mountain torrents and are a painful thing to hear — the forest is a place of pain. At night worn with fatigue, one must sleep upon the ground on a bed of leaves, broken off of themselves — the forest is a place of utter pain. And one has to fast, Sita, to the limit of one’s endurance, wear clothes of barkcloth and bear the burden of matted hair…. There are many creeping creatures, of every size and shape, my lovely, ranging aggressively over the ground…. Moths, scorpions, worms, gnats, and flies continually harass one, my frail Sita — the forest is wholly a place of pain….”

Sita was overcome with sorrow when she heard what Rama said. With tears trickling down her face, she answered him in a faint voice…. “If from feelings of love I follow you, my pure-hearted husband, I shall have no sin to answer for, because my husband is my deity. My union with you is sacred and shall last even beyond death…. If you refuse to take me to the forest despite the sorrow that I feel, I shall have no recourse but to end my life by poison, fire, or water.”

Though she pleaded with him in this and every other way to be allowed to go, great-armed Rama would not consent to taking her to the desolate forest. And when he told her as much, Sita fell to brooding, and drenched the ground, it seemed, with the hot tears that fell from her eyes…. She was nearly insensible with sorrow when Rama took her in his arms and comforted her…. “Without knowing your true feelings, my lovely, I could not consent to your living in the wilderness, though I am perfectly capable of protecting you. Since you are determined to live with me in the forest, Sita, I could no sooner abandon you than a self-respecting man his reputation…. My father keeps to the path of righteousness and truth, and I wish to act just as he instructs me. That is the eternal way of righteousness. Follow me, my timid one, be my companion in righteousness. Go now and bestow precious objects on the brahmins, give food to the mendicants and all who ask for it. Hurry, there is no time to waste."

Finding that her husband had acquiesced in her going, the lady was elated and set out at once to make the donations.

Brahmanism

The Aryans recognized a multitude of gods who shared some features with the gods of other early Indo-European societies such as the Persians and Greeks. Ordinary people dealt with these gods through priests who made animal sacrifices to them. By giving valued things to the gods, people strengthened both the power of the gods and their own relationships with them. Gradually, under the priestly monopoly of the Brahmins, correct sacrifice and proper ritual became so important that most Brahmins believed that a properly performed ritual would force a god to grant a worshipper's wish. Ordinary people could watch a ceremony, such as a fire ritual, which was often held outdoors, but could not perform the key steps in the ritual.

The *Upanishads* (oo-PAH-nih-shadz), composed between 750 B.C.E. and 500 B.C.E., record speculations about the mystical meaning of sacrificial rites and about cosmological questions of man's relationship to the universe. They document a gradual shift from the mythical worldview of the early Vedic Age to a deeply philosophical one. Associated with this shift was a movement toward asceticism (uh-SEH-tuh-sihz-uhm) — severe self-discipline and self-denial.

Ancient Indian cosmology (theories of the universe) focused not on a creator who made the universe out of nothing, but rather on endlessly repeating cycles. Key ideas were **samsara**, the reincarnation of souls by a continual process of rebirth, and **karma**, the tally of good and bad deeds that determined the status of an individual's next life. Good deeds led to better future lives, evil deeds to worse future lives — even to reincarnation as an animal. Reward and punishment worked automatically; there was no all-knowing god who judged people and could be petitioned to forgive a sin, and each individual was responsible for his or her own destiny in a just and impartial world.

samsara The transmigration of souls by a continual process of rebirth.

karma The tally of good and bad deeds that determines the status of an individual's next life.

To most people, especially those on the low end of the economic and social scale, these ideas were attractive. By living righteously and doing good deeds, people could improve their lot in the next life. Yet there was another side to these ideas: the wheel of life could be seen as a treadmill, giving rise to a yearning for release from the relentless cycle of birth and death. One solution offered in the *Upanishads* was moksha, or release from the wheel of life. Brahmanic mystics claimed that life in the world was actually an illusion and that the only way to escape the wheel of life was to realize that ultimate reality was unchanging.

The unchanging ultimate reality was called **brahman**. Brahman was contrasted to the multitude of fleeting phenomena that people consider important in their daily lives. The individual soul or self was ultimately the same substance as the universal brahman, in the same way that each spark is in substance the same as a large fire.

The *Upanishads* gave the Brahmins a high status to which the poor and lowly could aspire in a future life. The rulers of Indian society also encouraged the new trends, since the doctrines of samsara and karma encouraged the poor and oppressed to labor peacefully and dutifully. Thus, although the new doctrines were intellectually revolutionary, in social and political terms they supported the existing power structure.

brahman The unchanging ultimate reality, according to the *Upanishads*.

India’s Great Religions

What ideas and practices were taught by the founders of Jainism, Buddhism, and Hinduism?

By the sixth and fifth centuries B.C.E., cities had reappeared in India, and merchants and trade were thriving. Bricks were again baked in kilns and used to build ramparts around cities. One particular kingdom, Magadha, had become much more powerful than any of the other states in the Ganges plain, defeating its enemies by using war elephants and catapults for hurling stones. Written language had also reappeared.

This was a period of intellectual ferment throughout Eurasia — the period of the early Greek philosophers, the Hebrew prophets, Zoroaster in Persia, and Confucius and the early Daoists in China. In India it led to numerous sects that rejected various elements of Brahmanic teachings. The two most influential were Jainism and Buddhism. Their founders were contemporaries living in the Ganges plain. Hinduism emerged in response to these new religions but at the same time was the most direct descendant of the old Brahmanic religion.

Jainism

The key figure of Jainism, Vardhamana Mahavira (flourished ca. 520 B.C.E.), was the son of the chief of a small state and a member of the warrior class. Like many ascetics of the period, he left home to become a wandering holy man. For twelve years, from ages thirty to forty-two, he traveled through the Ganges Valley until he found enlightenment and became a “completed soul.” Mahavira taught his doctrines for about thirty years, founding a disciplined order of monks and gaining the support of many lay followers, male and female.

Mahavira accepted the Brahmanic doctrines of karma and rebirth but developed these ideas in new directions, founding the religion referred to as **Jainism**. He asserted that human beings, animals, plants, and even inanimate objects all have living souls enmeshed in matter, accumulated through the workings of karma. The souls conceived by the Jains float or sink depending on the amount of matter with which they are enmeshed. The ascetic, who willingly undertakes suffering, can dissipate some of the accumulated karma and make progress toward liberation. If a soul at last escapes from all the matter weighing it down, it becomes lighter than ordinary objects and floats to the top of the universe, where it remains forever in bliss.

Mahavira’s followers pursued such liberation by living ascetic lives and avoiding evil thoughts and actions. The Jains considered all life sacred and tried to live without destroying other life. A Jain who wished to avoid violence to life became a vegetarian and took pains not to kill any creature, even tiny insects in the air and soil. Farming was impossible for Jains, who tended instead to take up trade. Among the most conservative Jains, priests practiced nudity, for clinging to clothes, even a loincloth, was a form of attachment. Lay Jains could pursue Jain teachings by practicing nonviolence and not eating meat.

Jainism Indian religion whose followers consider all life sacred and avoid destroying other life.

Although Jainism never took hold as widely as Hinduism and Buddhism (discussed below), over the next few centuries it became an influential strand in Indian thought, and it has several million adherents in India today. Fasting and nonviolence as spiritual practices in India owe much to Jain teachings. In the twentieth century Mohandas Gandhi, leader of the Indian independence movement, was influenced by these ideas through his mother, and the American civil rights leader Dr. Martin Luther King, Jr., was in turn influenced by Gandhi.

Siddhartha Gautama and Buddhism

Siddhartha Gautama (fl. ca. 500 B.C.E.), also called Shakyamuni (“sage of the Shakya tribe”), is best known as the Buddha (“enlightened one”). He was a contemporary of Mahavira and came from the same warrior social class. He was born the son of a chief of one of the tribes in the Himalayan foothills in what is now Nepal. At age twenty-nine, unsatisfied with his life of comfort and troubled by the suffering he saw around him, he left home to become a wandering ascetic. He traveled south to the kingdom of Magadha, where he studied with yoga masters, but later took up extreme asceticism. According to tradition, while meditating under a bo tree at Bodh Gaya, he reached enlightenment — that is, perfect insight into the processes of the universe. After several weeks of meditation, he preached his first sermon, urging a “middle way” between asceticism and worldly life. For the next forty-five years, the Buddha traveled through the Ganges Valley, propounding his ideas, refuting his adversaries, and attracting followers. To reach as wide an audience as possible, the Buddha preached in the local language, Magadhi, rather than in Sanskrit, which was already becoming a priestly language. Probably because he refused to recognize the divine authority of the Vedas and dismissed sacrifices, he attracted followers mostly from among merchants, artisans, and farmers, rather than Brahmins. (See “Analyzing the Evidence: Gandharan Frieze Depicting the Buddha’s Enlightenment,” at right.)

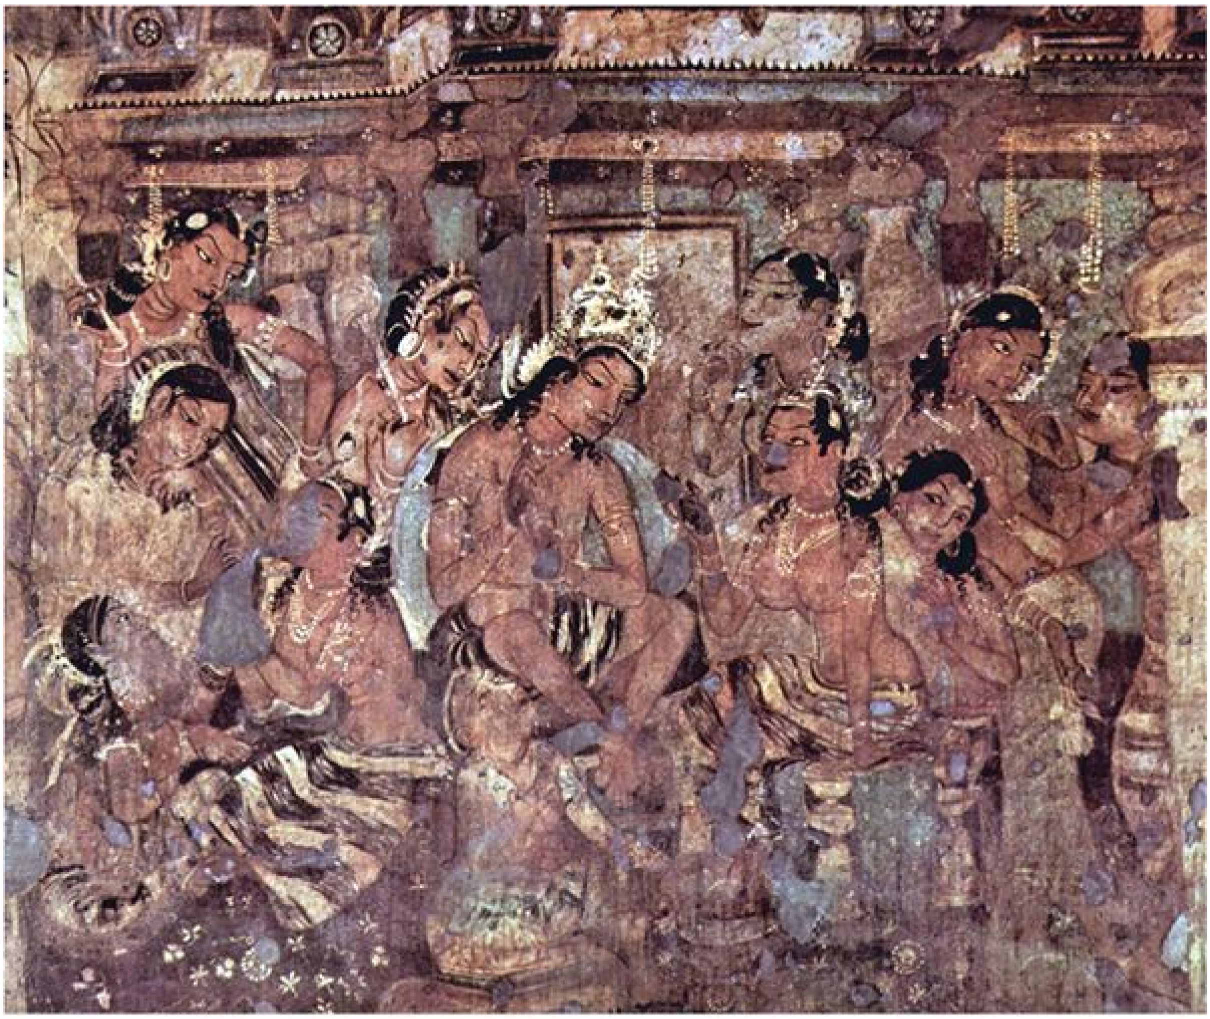
In his first sermon the Buddha outlined his main message, summed up in the **Four Noble Truths** and the **Eightfold Path**. The Four Noble Truths are as follows: (1) pain and suffering, frustration, and anxiety are ugly but inescapable parts of human life; (2) suffering and anxiety are caused by human desires and attachments; (3) people can understand these weaknesses and triumph over them; and (4) this triumph is made possible by following a simple code of conduct, the Eightfold Path. The basic insight of Buddhism is thus psychological. The deepest human longings can never be satisfied, and even those things that seem to give pleasure cause anxiety because we are afraid of losing them. Attachment to people and things causes sorrow at their loss.

Four Noble Truths The Buddha’s message that pain and suffering are inescapable parts of life; suffering and anxiety are caused by human desires and attachments; people can understand and triumph over these weaknesses; and this triumph is made possible by following a simple code of conduct.

Eightfold Path The eight-step code of conduct set forth by the Buddha in his first sermon.

Buddhism differed from Brahmanism and later Hinduism in that it ignored the caste system. Everyone, noble and peasant, educated and ignorant, male and female, could follow the Eightfold Path. Moreover, the Buddha was extraordinarily nondogmatic. Convinced that each person must achieve enlightenment on his or her own, he emphasized that the path was important only because it led the traveler to enlightenment, not for its own sake. He compared it to a raft, essential to cross a river but useless once the traveler reaches the far shore. There was no harm in honoring local gods or observing traditional ceremonies, as long as one remembered the goal of enlightenment and did not let sacrifices become snares or attachments. The willingness of Buddhists to tolerate a wide variety of practices aided the spread of the religion.

The Buddha’s followers transmitted his teachings orally until they were written down in the second or first century B.C.E. These scriptures are called sutras. The form of monasticism that developed among the Buddhists was less strict than that of the Jains. Buddhist monks moved about for eight months of the year (except the rainy season), begging for their one meal a day, but they could bathe and wear clothes. Within a few centuries Buddhist monks began to overlook the rule that they should travel. They set up permanent monasteries, generally on land donated by kings or other patrons. Orders of nuns also appeared, giving women the opportunity to seek truth in ways men had traditionally used. The main ritual that monks and nuns performed in their monastic establishments was the communal recitation of the sutras. Lay Buddhists could aid the spread of Buddhist teachings by providing food for monks and support for their monasteries, and they could pursue their own spiritual progress by adopting practices such as abstaining from meat and alcohol. (See "Individuals in Society: Sudatta, Lay Follower of the Buddha," at right.)



Pictures from History/Bridgeman Images

Palace Life As Buddhism developed, many stories were told of the prior lives of the Buddha.

This scene is from a story of Prince Mahajanaka, whose uncle usurped his throne, leading him to become a merchant and have many adventures before returning to marry the daughter of his uncle and retake the throne. This scene, from the Ajanta caves, shows him enjoying the pleasures of palace life.

Because Buddhism had no central ecclesiastical authority like the Christian papacy, early Buddhist communities developed several divergent traditions and came to stress different sutras. One of the most important of these, associated with the monk-philosopher Nagarjuna (fl. ca. 100 C.E.), is called **Mahayana**, or “Great Vehicle,” because it was a more inclusive form of the religion. One branch of Mahayana taught that reality is empty (that is, nothing exists independently of itself). Another branch held that ultimate reality is consciousness, that everything is produced by the mind.

Mahayana The “Great Vehicle,” a tradition of Buddhism that aspires to be more inclusive.

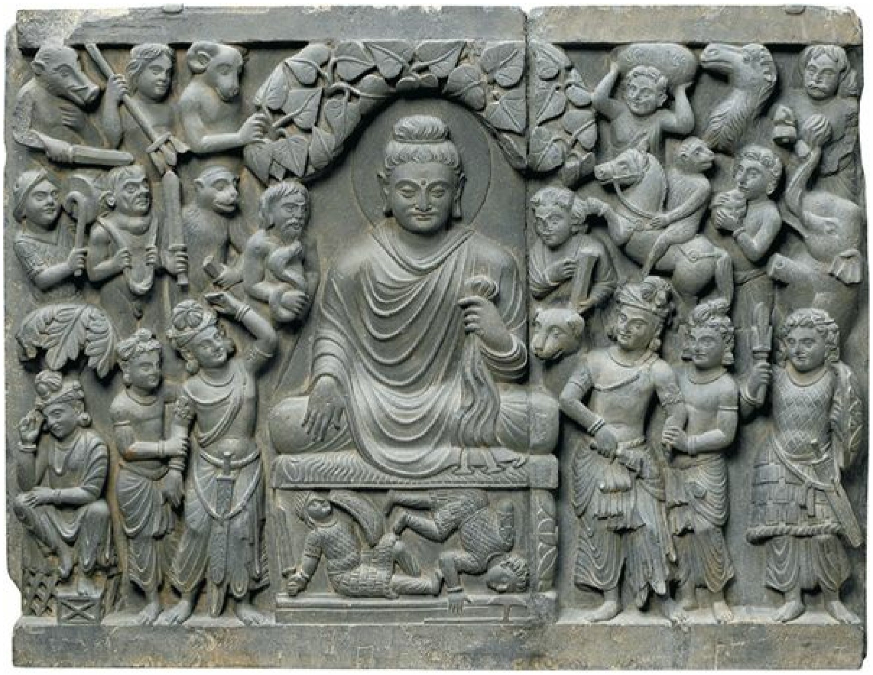
Just as important as the metaphysical literature of Mahayana Buddhism was its devotional side, influenced by the religions then prevalent in Central Asia, such as Zoroastrianism (see “The Religion of Zoroaster” in Chapter 2). The Buddha became deified and was placed at the head of an expanding pantheon of other Buddhas and **bodhisattvas** (boh-dih-SUHT-vuhz). Bodhisattvas were Buddhas-to-be who had stayed in the world after enlightenment to help others on the path to salvation. The Buddhas and bodhisattvas became objects of veneration. With the growth of Mahayana, Buddhism attracted more and more laypeople.

bodhisattvas Buddhas-to-be who stayed in the world after enlightenment to help others on the path to salvation.

Buddhism remained an important religion in India until about 1200 C.E. By that time it had spread widely through East, Central, and Southeast Asia. After 1200 C.E. Buddhism declined in India, losing out to both Hinduism and Islam, and the number of Buddhists in India today is small. Buddhism never lost its hold in Nepal and Sri Lanka, however, and today it is also a major religion in Southeast Asia, Tibet, China, Korea, and Japan.

ANALYZING THE EVIDENCE

Gandharan Frieze Depicting the Buddha's Enlightenment



Freer Gallery, Smithsonian Institution/Bridgeman Images

Gandhara is the region in modern Afghanistan and Pakistan encompassing the Swat and Peshawar Valleys. It became a major center of Buddhism during the era when the Kushans were kings, especially the first and second centuries C.E. Greek artistic styles had been brought to the region by successors of Alexander the Great, and during the Kushan period these styles were adopted to depict the Buddha in stone sculpture. The rulers and other well-to-do patrons commissioned hundreds of Buddhist monuments as a way to acquire merit, and many survive today. Depictions of episodes from the life of the Buddha are common. Gandharan images of the Buddha usually show him with garments draped over a shoulder and his wavy hair drawn up in a bun.

The sculpture shown here, from the Gandharan region and probably dating to about 200 C.E., is one of a set of four that depicts the four major events in the life of the Buddha: his birth, his enlightenment, his first sermon, and his abandonment of his physical body for nirvana. These stones are 26 inches tall and probably originally decorated the walls of a stupa (a monument holding relics).

Buddhist tradition holds that after sitting for forty days under a bo tree, the Buddha became enlightened — that is, attained perfect understanding. This occurred in Bodh Gaya, a small city in north India that in time became a major pilgrimage site for Buddhists.

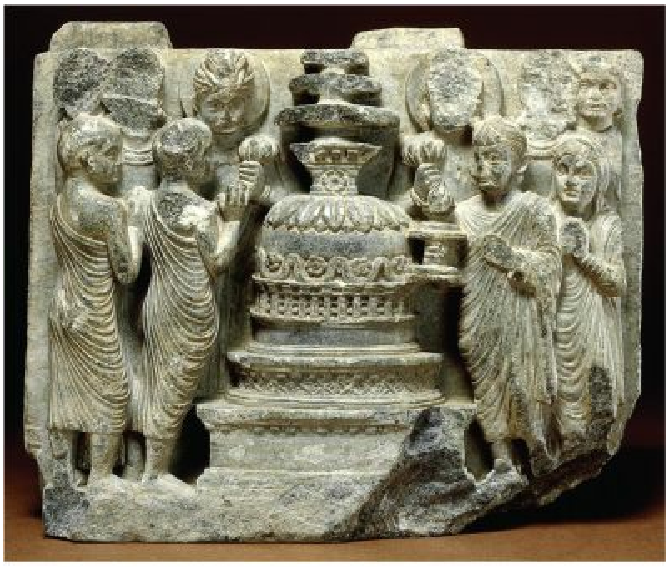
In this sculpture, the Buddha sits cross-legged under a canopy of tree leaves. Two toppled soldiers, possibly representing evil demons, are depicted under his seat. Looking on are both human beings in a variety of costumes and several sorts of animals, some with seemingly human features. In Buddhist cosmology, animals are part of the circle of life. In their next incarnation, they might be born as a human being or even a god, in the same way that human beings, if their tally of good and bad deeds leads to rebirth at a lower level, can be reincarnated as animals or insects.

QUESTIONS FOR ANALYSIS

1. What are the people around the Buddha doing? How are they dressed?
2. How many different kinds of animals are depicted in the frieze? Do they have any human traits? Why would they be attracted to the Buddha?
3. What do you think the patron or the sculptor hoped to achieve by creating this piece?
4. Does this piece successfully convey any Buddhist teachings? If so, which ones?

INDIVIDUALS IN SOCIETY

Sudatta, Lay Follower of the Buddha



British Museum, London, UK/Erich Lessing/Art Resource, NY

The people depicted here are performing the Buddhist ritual of circumambulating a stupa (a mound containing the ashes or other relics of a monk).

AS HE TAUGHT, THE BUDDHA attracted both disciples and lay followers. Stories of his interactions with them were passed down orally for centuries, and undoubtedly were elaborated over time. Still, these accounts give us a sense of what life was like in early India. The wealthy banker or merchant Sudatta is a good example of an ardent lay follower. He was so generous to others that he is normally referred to by his epithet, Anathapindada, which means "benefactor of the needy."

In one conversation with the Buddha, Sudatta asks if he must leave the world to attain nirvana:

> Now, I have heard thy disciples praise the bliss of the hermit and denounce the unrest of the world. "The Holy One," they say, "has given up his kingdom and his inheritance, and has found the path of righteousness, thus setting an example to all the world how to attain Nirvana." My heart yearns to do what is right and to be a blessing unto my fellows. Let me then ask you, Must I give up my wealth, my home, and my business enterprises, and, like you, go into homelessness in order to attain the bliss of a religious life?

The Buddha replied that the individual’s approach to wealth was crucial. Anyone who cleaves to wealth needs to cast it aside, but anyone who, “possessing riches, uses them rightly, will be a blessing unto his fellows.” It is cleaving to wealth and power that enslaves people, not the mere possession of wealth. “If they live in the world not a life of self but a life of truth, then surely joy, peace, and bliss will dwell in their minds.”[*]

Sudatta purchased a large park to provide a place where the Buddha and his disciples could live during the rainy season and had many buildings built there. The Buddha returned to this Jetavana Monastery many times. Sudatta also gave generously to the poor and needy. As a result of his generosity, Sudatta gradually grew poor. Then, through divine intervention, those who owed him money returned it, making him wealthy once again.

Stories recounted that Sudatta’s family, including his son and three daughters, became pious followers. The Buddha himself helped convert Sudatta’s unpleasant daughter-in-law. After hearing Sudatta’s son’s wife scolding the servants, the Buddha instructed her on the proper conduct of wives. There were three types of bad wives, he told her: the destructive wife, who is pitiless, fond of other men, and contemptuous of her husband; the thievish wife, who squanders the family wealth; and the mistress wife, who is rude, lazy, and domineering. These he contrasted with the four kinds of good wives: the motherly wife, who cares for her husband as a mother for her son; the sisterly wife, who defers to her husband as a younger sister defers to her older brother; the friend wife, who loves her husband as if he were her best friend; and the handmaiden wife, who is calm, patient, and obedient. Deeply moved by these teachings, the daughter-in-law determined to be a handmaiden wife.

Sudatta died before the Buddha. On his deathbed, Sudatta was advised to face death by deciding not to cling to what is seen, heard, sensed, thought, attained, sought after, or pondered by the intellect.

QUESTIONS FOR ANALYSIS

1. What can you infer about the circumstances of the early followers of the Buddha from the life of Sudatta?
2. What insights does the life of Sudatta provide into the ways faith in Buddhism was spread?

Hinduism

Both Buddhism and Jainism were direct challenges to the old Brahmanic religion. Both rejected animal sacrifice, which by then was a central element in the rituals performed by Brahmin priests. Even more important, both religions tacitly rejected the caste system, accepting people of any caste into their ranks. Over the next several centuries (ca. 400 B.C.E.–200 C.E.), in response to this challenge, the Brahmanic religion evolved in a more devotional direction, developing into the religion commonly called Hinduism. In Hinduism Brahmins retained their high social status, but it became possible for individual worshippers to have more direct contact with the gods, showing their devotion without using priests as intermediaries.

The bedrock of Hinduism is the belief that the Vedas are sacred revelations and that a specific caste system is implicitly prescribed in them. Hinduism is a guide to life, the goal of which is to reach union with brahman, the unchanging ultimate reality. There are four steps in this search, progressing from study of the Vedas in youth to complete asceticism in old age. In their quest for brahman, people are to observe **dharma** (DAHR-muh), the moral law.

The God Vishnu Vishnu is depicted here coming to the rescue of an elephant in the clutches of a crocodile. It comes from the fifth-century-C.E. Dasavatara Temple in Uttar Pradesh.

dharma The Sanskrit word for moral law, central to both Buddhist and Hindu teachings.

Hinduism assumes that there are innumerable legitimate ways of worshipping brahman, including devotion to personal gods. After the third century B.C.E. Hinduism began to emphasize the roles and personalities of thousands of powerful gods. These gods were usually represented by images, either small ones in homes or larger ones in temples. People could show devotion to their personal gods by reciting hymns or scriptures and by making offerings of food or flowers before these images. A worshipper’s devotion to one god did not entail denial of other deities; ultimately all were manifestations of brahman, the ultimate reality. Hinduism’s embrace of a large pantheon of gods enabled it to incorporate new sects, doctrines, beliefs, rites, and deities.

A central ethical text of Hinduism is the *Bhagavad Gita* (BAH-guh-vahd GEE-tuh), a part of the world’s longest ancient epic, the *Mahabharata*. It was passed down orally for centuries before being recorded in its present form, perhaps as late as the fourth century C.E. The *Bhagavad Gita* offers guidance on the most serious problem facing a Hindu — how to live in the world and yet honor dharma and thus achieve release from the wheel of life. The heart of the *Bhagavad Gita* is the spiritual conflict confronting Arjuna, a human hero about to ride into battle against his kinsmen. As he surveys the battlefield, struggling with the grim notion of killing his relatives, Arjuna voices his doubts to his charioteer, none other than the god Krishna. When at last Arjuna refuses to spill his family’s blood, Krishna then clarifies the relationship between human reality and the eternal spirit. He explains compassionately to Arjuna the duty to act — to live in the world and carry out his duties as a warrior. Indeed, the *Bhagavad Gita* emphasizes the necessity of action, which is essential for the welfare of the world. For Arjuna the warrior’s duty is to wage war in compliance with his dharma. Only those who live within the divine law without complaint will be released from rebirth. One person’s dharma may be different from another’s, but both individuals must follow their own dharmas.

Hinduism provided a complex and sophisticated philosophy of life and a religion of enormous emotional appeal that was attractive to ordinary Indians. Over time it grew to be the most common religion in India.

Hinduism validated the caste system, adding to the stability of everyday village life, since people all knew where they stood in society. Hinduism also inspired the preservation of literary masterpieces in Sanskrit and the major regional languages of India. Among these are the *Puranas*, which are stories of the gods and great warrior clans, and the *Mahabharata* and *Ramayana*, which are verse epics of India’s early kings.

Western Contact and the Mauryan Unification of North India, ca. 513–185 B.C.E.

What was the result of Indian contact with the Persians and Greeks, and what were the consequences of unification under the Mauryan Empire?

In the late sixth century B.C.E., with the creation of the Persian Empire that stretched from the west coast of Anatolia to the Indus River (see “The Rise and Expansion of the Persian Empire” in Chapter 2), west India was swept up in events that were changing the face of the ancient Near East. A couple of centuries later, by 322 B.C.E., the Greeks had supplanted the Persians in northwest India. Chandragupta saw this as an opportunity to expand his territories, and he successfully unified all of north India. The Mauryan (MAWR-ee-uhn) Empire that he founded flourished under the reign of his grandson, Ashoka, but after Ashoka’s death the empire declined.

Encounters with the West

India became involved in the turmoil of the sixth century B.C.E. when the Persian emperor Darius conquered the Indus Valley and Kashmir in northwest India about 513 B.C.E. Persian control did not reach eastward beyond the Punjab, but even so, it fostered increased contact between India and the Near East and led to the introduction of new ideas, techniques, and materials into India — including the minting of silver coins and writing in the Aramaic script to keep records.

The Persian Empire in turn succumbed to Alexander the Great, and in 326 B.C.E. Alexander led his Macedonian and Greek troops through the Khyber Pass into the Indus Valley (see “From Polis to Monarchy, 404–200 B.C.E.” in Chapter 5). The India that Alexander encountered was composed of many rival states. He defeated some of these states in the northwest and heard reports of others.

Hellenistic Influences in Gandharan Art Because Alexander the Great's army had reached Gandhara and Hellenistic states subsequently controlled it for more than a century, the art of this region was strongly influenced by Greek artistic styles. This stucco figure was excavated from a site in eastern Afghanistan where some twenty-three thousand Greco-Buddhist sculptures were found. Hellenistic influence, as evidenced by the drape of the clothing and the modeling of the head, is particularly easy to recognize in this piece.

The Greeks were intrigued by the Indian culture they encountered. Alexander had heard of the sophistication of Indian philosophers and summoned some to instruct him or debate with him. The Greeks were also impressed with Indian cities, most notably Taxila, a major center of trade in the Punjab. From Taxila, Alexander followed the Indus River south, hoping to find the end of the world. His men, however, mutinied and refused to continue. When Alexander turned back, he left his general Seleucus (suh-LOO-kuhs) in charge of his easternmost region.

Chandragupta and the Founding of the Mauryan Empire

The one to benefit most from Alexander's invasion was Chandragupta, the ruler of a growing state in the Ganges Valley. He took advantage of the crisis caused by Alexander’s invasion to expand his territories, and by 322 B.C.E. he had made himself sole master of north India (Map 3.2). In 304 B.C.E. he defeated the forces of Seleucus.

CONNECTIONS Can you think of any reasons that the Persian Empire and Alexander’s conquests both reached into the same region of northwest India?

With stunning effectiveness, Chandragupta applied the lessons learned from Persian rule. He adopted the Persian practice of dividing the area into provinces. Each province was assigned a governor, usually drawn from Chandragupta’s own family. He established a complex bureaucracy to see to the operation of the state and a bureaucratic taxation system that financed public services through taxes on agriculture. He also built a regular army, complete with departments for everything from naval matters to the collection of supplies.

For the first time in Indian history, one man governed most of the subcontinent, exercising control through delegated power. From his capital at Pataliputra in the Ganges Valley, Chandragupta sent agents to the provinces to oversee the workings of government and to keep him informed of conditions in his realm. In designing his bureaucratic system, Chandragupta enjoyed the able assistance of his great minister Kautilya, who wrote a treatise called the *Arthashastra* on how a king should seize, hold, and manipulate power. Kautilya urged the king to use propaganda to gain support, and stressed the importance of seeking the enemies of his enemies, who would make good allies. When a neighboring prince was in trouble, that was the perfect time to attack him.

Megasthenes, a Greek ambassador sent by Seleucus, spent fourteen years in Chandragupta's court. He left a lively description of life there. He described the city as square and surrounded by wooden walls, 22 miles on each side, with 570 towers and 64 gates. It had a university, a library, and magnificent palaces, temples, gardens, and parks. The king personally presided over court sessions where legal cases were heard and petitions received. The king claimed for the state all mines and forests, and there were large state farms, granaries, shipyards, and spinning and weaving factories. Even prostitution was controlled by the state. Only a portion of the empire was ruled so directly, according to Megasthenes. In outlying areas, local kings were left in place if they pledged loyalty. Megasthenes described Chandragupta's fear of treachery and assassination attempts:

> Nor does the king sleep during the day, and at night he is forced at various hours to change his bed because of those plotting against him.… When he leaves to hunt, he is thickly surrounded by a circle of women, and on the outside by spear-carrying bodyguards. The road is fenced off with ropes, and to anyone who passes within the ropes as far as the women death is the penalty.[2]

Those measures apparently worked, as Chandragupta lived a long life. According to Jain tradition, Chandragupta became a Jain ascetic and died a peaceful death in 298 B.C.E. Although he personally adopted a nonviolent philosophy, he left behind a kingdom with the military might to maintain order and defend India from invasion.

The Reign of Ashoka, ca. 269–232 B.C.E.

Chandragupta’s grandson Ashoka proved to be one of India’s most remarkable figures. The era of Ashoka was enormously important in the religious history of the world, because Ashoka embraced Buddhism and promoted its spread beyond India.

As a young prince, Ashoka served as governor of two prosperous provinces where Buddhism flourished. At the death of his father about 274 B.C.E., Ashoka rebelled against his older brother, who had succeeded as king, and after four years of fighting won his bid for the throne. Crowned king, Ashoka ruled intelligently and energetically.

The North Gate at Sanchi This is one of four ornately carved gates guarding the stupa at Sanchi in the state of Madhya Pradesh in India. Containing the relics of the Buddha, this Buddhist memorial shrine was originally commissioned by Ashoka, but the gateways were added later.

In the ninth year of his reign, 261 B.C.E., Ashoka conquered Kalinga, on the east coast of India. In a grim and savage campaign, Ashoka reduced Kalinga by wholesale slaughter. As Ashoka himself admitted, “One hundred and fifty thousand were forcibly abducted from their homes, 100,000 were killed in battle, and many more died later on.”[3] Instead of exulting like a conqueror, however, Ashoka was consumed with remorse and revulsion at the horror of war. He embraced Buddhism and used the machinery of his empire to spread Buddhist teachings throughout India. He supported the doctrine of not hurting humans or animals that was then spreading among religious people of all sects in India. He banned animal sacrifices, and in place of hunting expeditions he took pilgrimages. Two years after his conversion, he undertook a 256-day pilgrimage to all the holy sites of Buddhism, and on his return he sent missionaries to all known countries. Ashoka's remarkable crisis of conscience changed the way he ruled. He emphasized compassion, nonviolence, and adherence to dharma. He appointed officials to oversee the moral welfare of the realm and required local officials to govern humanely. Ashoka erected stone pillars, on the Persian model, with inscriptions to inform the people of his policies. He also had long inscriptions carved into large rock surfaces near trade routes. In his last important inscription he spoke of his efforts to encourage his people toward the path of righteousness:

> I have had banyan trees planted on the roads to give shade to man and beast; I have planted mango groves, and I have had ponds dug and shelters erected along the roads at every eight kos. Everywhere I have had wells dug for the benefit of man and beast. But this benefit is but small, for in many ways the kings of olden time have worked for the welfare of the world; but what I have done has been done that men may conform to righteousness.[4]

These inscriptions are the earliest fully dated Indian texts. (Until the script in which they were written was deciphered in 1837, nothing was known of Ashoka's achievements.)

Ashoka felt the need to protect his new religion and to keep it pure. He warned Buddhist monks that he would not tolerate schism — divisions based on differences of opinion about doctrine or ritual. According to Buddhist tradition, a great council of Buddhist monks was held at Pataliputra, where the earliest canon of Buddhist texts was codified. At the same time, Ashoka honored India's other religions, even building shrines for Hindu and Jain worshippers.

Despite his devotion to Buddhism, Ashoka never neglected his duties as ruler of the **Mauryan Empire**. He tightened the central government of the empire and kept a close check on local officials. He built roads and rest spots to improve communication within the realm. These measures also facilitated the march of armies and the armed enforcement of Ashoka's authority.

Mauryan Empire The first Indian empire, founded by Chandragupta.

Ashoka ruled for thirty-seven years. After he died in about 232 B.C.E., the Mauryan Dynasty went into decline, and India broke up into smaller units, much like those in existence before Alexander’s invasion. Even though Chandragupta had instituted bureaucratic methods of centralized political control and Ashoka had vigorously pursued the political and cultural integration of the empire, the institutions they created were not entrenched enough to survive periods with weaker kings.

Small States and Trading Networks, 185 B.C.E.–300 C.E.

How was India shaped by political disunity and contacts with other cultures during the five centuries from 185 B.C.E. to 300 C.E.?

After the end of the Mauryan Dynasty in 185 B.C.E. and for much of subsequent Indian history, political unity would be the exception rather than the rule. By this time, however, key elements of Indian culture — the caste system; the religious traditions of Hinduism, Buddhism, and Jainism; and the great epics and legends — had given India a cultural unity strong enough to endure even without political unity.

In the years after the fall of the Mauryan Dynasty, a series of foreign powers dominated the Indus Valley and adjoining regions. The first were hybrid Indo-Greek states ruled by the inheritors of Alexander's defunct empire stationed in what is now Afghanistan. The city of Taxila became a major center of trade, culture, and education, fusing elements of Greek and Indian culture.

The great, slow movement of nomadic peoples out of East Asia that brought the Scythians to the Near East brought the Shakas to northwest India. They controlled the region from about 94 B.C.E. to 20 B.C.E., when they were displaced by a new nomadic invader, the Kushans, who ruled the region of today's Afghanistan, Pakistan, and west India as far south as Gujarat.

The Kushan Empire, ca. 200 C.E.

During the Kushan period, which lasted to about 250 C.E., Greek culture had a considerable impact on Indian art. Indo-Greek artists and sculptors working in India adorned Buddhist shrines, modeling the earliest representation of the Buddha on Hellenistic statues of Apollo. Another contribution from the Indo-Greek states was coin cast with images of the king, which came to be widely adopted by Indian rulers, aiding commerce and adding evidence of rulers' names and sequence to the historical record. Places where coins are found also show patterns of trade.

Cultural exchange also went in the other direction. Old Indian animal folktales were translated into Syriac and Greek, and these translated versions eventually made their way to Europe. South India in this period was also the center of active seaborne trade, with networks reaching all the way to Rome. Indian sailing technology was highly advanced, and much of this trade was in the hands of Indian merchants. Roman traders based in Egypt followed the routes already used by Arab traders, sailing with the monsoon from the Red Sea to the west coast of India in about two weeks, and returning about six months later when the direction of the winds reversed. In the first century C.E. a Greek merchant involved in this trade reported that the traders sold coins, topaz, coral, crude glass, copper, tin, and lead and bought pearls, ivory, silk (probably originally from China), jewels of many sorts (probably many from Southeast Asia), and above all cinnamon and pepper. More Roman gold coins of the first and second centuries C.E. have been found near the southern tip of India than in any other area.

Lotus Gatherer This image of a woman gathering lotuses is from Sittanavasal Cave, a second-century-C.E. rock-cut temple in Tamil Nadu near the south end of India.

During these centuries there were significant advances in science, mathematics, and philosophy. Indian astronomers charted the movements of stars and planets and recognized that the earth was spherical. In the realm of physics, Indian scientists, like their Greek counterparts, conceived of matter in terms of five elements: earth, air, fire, water, and ether. This was also the period when Indian law was codified. The ***Code of Manu***, which lays down family, caste, and commercial law, was compiled in the second or third century C.E., drawing on older texts.

Code of Manu The codification of early Indian law that lays down family, caste, and commercial law.

Regional cultures tend to flourish when there is no dominant unifying state, and the Tamils of south India were one of the major beneficiaries of the collapse of the Mauryan Dynasty. The period from 200 B.C.E. to 200 C.E. is considered the classical period of Tamil culture, when many great works of literature were written under the patronage of the regional kings. Some of the poems written then provide evidence of lively commerce, mentioning bulging warehouses, ships from many lands, and complex import-export procedures. From contact of this sort, the south came to absorb many cultural elements from the north, but also retained differences. Castes were present in the south before contact with the Sanskrit north, but took distinct forms, as the Kshatriya (warrior) and Vaishya (merchant) varnas were hardly known in the far south.

Chapter Summary

Civilization first emerged in the Indus River Valley of India in the third millennium B.C.E. The large cities of this Harappan civilization were carefully planned, with straight streets and sewers; buildings were of kiln-dried brick. Harappan cities were largely abandoned by 1800 B.C.E. for unknown reasons.

A few centuries later, the Aryans, speakers of an early form of the Indo-European language Sanskrit, rose to prominence in north India, marking the beginning of the Vedic Age. Aryan warrior tribes fought using chariots and bronze swords and spears, gradually expanding into the Ganges River Valley. The first stages of the Indian caste system date to this period, when warriors and priests were ranked above merchants, artisans, and farmers. The Vedas document the religious ideas of this age, such as the importance of sacrifice and the notions of karma and rebirth.

Beginning around 500 B.C.E. three of India's major religions emerged. Mahavira, the founder of the Jain religion, taught his followers to live ascetic lives, avoid harming any living thing, and renounce evil thoughts and actions. The founder of Buddhism, Siddhartha Gautama, or the Buddha, similarly taught his followers a path to liberation that involved freeing themselves from desires, avoiding violence, and gaining insight. Hinduism developed in response to the popularity of Jainism and Buddhism, both of which rejected animal sacrifice and ignored the caste system. Hindu traditions validated sacrifice and caste and developed devotional practice, giving individuals a more personal relationship with the gods they worshipped.

From contact with the Persians and Greeks in the sixth century B.C.E. and fourth century B.C.E., respectively, new political techniques, ideas, and art styles and the use of money entered the Indian repertoire. Shortly after the arrival of the Greeks, much of north India was politically unified by the Mauryan Empire under Chandragupta. His grandson Ashoka converted to Buddhism and promoted its spread inside and outside of India.

After the decline of the Mauryan Empire, India was politically fragmented for several centuries. Indian cultural identity remained strong, however, because of shared literature and religious ideas. In the northwest, new nomadic groups, the Shakas and the Kushans, emerged. Cultural interchange was facilitated through trade both overland and by sea.

CONNECTIONS

India was a very different place in the third century C.E. than it had been in the early phase of Harappan civilization more than two thousand years earlier. The region was still divided into many different polities, but people living there in 300 shared much more in the way of ideas and traditions. The great epics such as the *Mahabharata* and the *Ramayana* provided a cultural vocabulary for groups that spoke different languages and had rival rulers. New religions had emerged, notably Buddhism and Jainism, and Hinduism was much more a devotional religion. Contact with ancient Mesopotamia, Persia, Greece, and Rome had brought new ideas, practices, and products.

During this same time period, civilization in China underwent similar expansion and diversification. China was farther away than India from other Eurasian centers of civilization, and its developments were consequently not as closely linked. In China, writing with a symbol for each word appeared with the Bronze Age Shang civilization and was preserved into modern times, in striking contrast to India and lands to its west, which developed alphabetical writing systems. Still, some developments affected both India and China, such as the appearance of chariots and horseback riding. The next chapter takes up the story of these developments in early China. In Chapter 12, after considering early developments in Europe, Asia, Africa, and the Americas, we return to the story of India.

This bronze lamp stand from the region of the Zhou royal tombs dates to the Warring States Period.

In comparison to India and Mesopotamia, China developed in relative isolation. Communication with West and South Asia was very difficult, impeded by high mountains and vast deserts. Though there was some trade, the distances were so great that they did not allow the kind of cross-fertilization that occurred in western Eurasia. Moreover, there were no cultural breaks comparable to the rise of the Aryans in India or the Assyrians in Mesopotamia to introduce new peoples and languages. The impact of early China's relative isolation is found in many distinctive features of its culture. Perhaps the most important is its writing system; unlike the other major societies of Eurasia, China retained a logographic writing system with a symbol for each word. This writing system shaped not only Chinese literature and thought but also key social and political processes, such as the nature of the ruling class and interactions with non-Chinese peoples.

Chinese history is commonly discussed in terms of a succession of dynasties. The Shang Dynasty (ca. 1500–1050 B.C.E.) was the first to have writing, metalworking, cities, and chariots. The Shang kings played priestly roles, serving as intermediaries with both their royal ancestors and the high god Di. The Shang were overthrown by one of their vassal states, which founded the Zhou Dynasty (ca. 1050). The Zhou rulers set up a decentralized feudal governmental structure that evolved over centuries into a multistate system, with the Zhou Dynasty itself not abolished until 256 B.C.E. As warfare between the states intensified in the sixth century B.C.E., social and cultural change quickened. Aristocratic privileges declined, and China entered one of its most creative periods, when the philosophies of Confucianism, Daoism, and Legalism were developed.

The Emergence of Civilization in China

What was the impact of China’s geography on the development of Chinese societies?

The term *China*, like the term *India*, does not refer to the same geographical entity at all points in history. The historical China, also called China proper, was smaller than present-day China, not larger like the historical India. The contemporary People’s Republic of China includes Tibet, Inner Mongolia, Turkestan, Manchuria, and other territories that in premodern times were neither inhabited by Chinese nor ruled directly by Chinese states.

The Impact of Geography

China proper, about a thousand miles north to south and east to west, occupies much of the temperate zone of East Asia (Map 4.1). The northern part, drained by the Yellow River, is colder, flatter, and more arid than the south. Rainfall in many areas is less than twenty inches a year, making the land well suited to crops like wheat and millet. The dominant soil is **loess** (LUHS) — fine wind-driven earth that is fertile and easy to work even with simple tools. Because so much of the loess ends up as silt in the river, the riverbed rises and easily floods unless diked. Drought is another perennial problem for farmers in the north. The Yangzi (YANG-zuh) River is the dominant feature of the warmer, wetter, and more lush south, a region well suited to rice cultivation. The Yangzi and its many tributaries are navigable, so boats were traditionally the preferred means of transportation in the south.

MAP 4.1 The Geography of Historical China Chinese civilization developed in the temperate regions drained by the Yellow and Yangzi Rivers.

ANALYZING THE MAP Trace the routes of the Yellow and Yangzi Rivers. Where are the areas of loess soil? Where are the Neolithic sites concentrated?

CONNECTIONS Does China's geography explain much about its history? (See also Map 4.2.) What geographical features had the greatest impact in the Neolithic Age? How might the fact that the Yellow and Yangzi Rivers flow west to east, rather than north to south, have influenced the development of Chinese society?

loess Soil deposited by wind; it is fertile and easy to work.

Mountains, deserts, and grasslands separated China proper from other early civilizations. Between China and India lay Tibet, with its vast mountain ranges and high plateaus. North of Tibet are great expanses of desert, and north of the desert, grasslands stretch from Ukraine to eastern Siberia. Chinese civilization did not spread into any of these Inner Asian regions, above all because they were not suited to growing crops. Inner Asia, where raising animals is a more productive use of land than planting crops, became the heartland of China's traditional enemies, such as the nomadic tribes of the Xiongnu (SHUHNG-noo) and Mongols.

Early Agricultural Societies of the Neolithic Age

From about 9000 B.C.E. agriculture was practiced in China beginning in the Yellow River Valley. It apparently originated independently of somewhat earlier developments in Egypt and Mesopotamia but was perhaps influenced by developments in Southeast Asia, where rice was also cultivated very early. By 7000 B.C.E. cattle had been domesticated and plow agriculture began. By 5000 B.C.E. there were Neolithic village settlements in several regions of China. The primary Neolithic crops were drought-resistant millet, grown in the loess soils of the north, and rice, grown in the wetlands of the lower reaches of the Yangzi River, where inhabitants supplemented their diet with fish. In both areas pigs, dogs, and cattle were domesticated, and by 3000 B.C.E. sheep had become important in the north and water buffalo in the south. Silk production can also be traced back to this period.

Neolithic Jade Plaque This small plaque (2½ inches by 3¼ inches), dating from about 2000 B.C.E., is similar to others of the Liangzhu area near modern Shanghai. It is incised to depict a human figure that merges into a monster mask. The lower part could be interpreted as the figure’s arms and legs but at the same time resembles a monster mask with bulging eyes, prominent nostrils, and a large mouth.

Over the course of the fifth to third millennia B.C.E., many distinct regional Neolithic cultures emerged. These Neolithic societies left no written records, but we know from the material record that over time they came to share more social and cultural practices. Fortified walls made of rammed earth were built around settlements in many places, suggesting not only increased contact between Neolithic societies but also increased conflict. (For more on life in Neolithic societies, see Chapter 1.)

The Shang Dynasty, ca. 1500–1050 B.C.E.

What was life like during the Shang Dynasty, and what effect did writing have on Chinese culture and government?

Archaeological evidence indicates that after 2000 B.C.E. a Bronze Age civilization appeared in north China that shared traits with Bronze Age civilizations elsewhere in Eurasia, such as Mesopotamia, Egypt, and Greece. These traits included writing, metalworking, class stratification, and cult centers. This civilization can be identified with the Shang Dynasty, long known from early texts.

Shang Society

Shang civilization was not as densely urban as that of Mesopotamia, but Shang kings ruled from large settlements (Map 4.2). The best excavated is **Anyang**, from which the Shang kings ruled for more than two centuries. At the center of Anyang were large palaces, temples, and altars. Outside the central core were industrial areas where bronzeworkers, potters, stone carvers, and other artisans lived and worked. Many homes were built partly below ground level, probably as a way to conserve heat. Beyond these urban settlements were farming areas and large forests. Deer, bears, tigers, wild boars, elephants, and rhinoceros were still plentiful in north China in this era.

MAP 4.2 The Shang and Early Zhou Dynasties, ca. 1500–400 B.C.E. The early Zhou government controlled larger areas than the Shang did, but the independent states of the Warring States Period were more aggressive about pushing out their frontiers, greatly extending the geographical boundaries of Chinese civilization.

Anyang One of the Shang Dynasty capitals from which the Shang kings ruled for more than two centuries.

Texts found in the Shang royal tombs at Anyang show that Shang kings were military chieftains. The king regularly sent out armies of three thousand to five thousand men on campaigns, and when not at war they would go on hunts lasting for months. They fought rebellious vassals and foreign tribes, but the situation constantly changed as vassals became enemies and enemies accepted offers of alliance. War booty was an important source of the king's revenue, especially the war captives who could be enslaved. Bronze-tipped spears and battle axes were widely used by Shang warriors, giving them an advantage over less technologically advanced groups. Bronze was also used for the fittings of the chariots that came into use around 1200 B.C.E. Chariot technology apparently spread by diffusion across Eurasia, passing from one society to the next.

Shang power did not rest solely on military supremacy. The Shang king was also the high priest, the one best qualified to offer sacrifices to the royal ancestors and the high god Di. Royal ancestors were viewed as able to intervene with Di, send curses, produce dreams, assist the king in battle, and so on. The king divined his ancestors' wishes by interpreting the cracks made in heated cattle bones or tortoise shells prepared for him by professional diviners.

Shang palaces were undoubtedly splendid but were constructed of perishable material like wood, and nothing of them remains today, giving China none of the ancient stone buildings and monuments so characteristic of the West. What has survived are the lavish underground tombs built for Shang kings and their consorts.

Royal Burials at Anyang Eleven large tombs and more than a thousand small graves have been excavated at the royal burial ground at Anyang. In 2005 seven pits were discovered in which horses and chariots had been buried to accompany a king in the afterlife.

The one royal tomb not robbed before it was excavated was for Lady Hao, one of the many wives of the king Wu Ding (ca. 1200 B.C.E.). The tomb was filled with almost 500 bronze vessels and weapons, over 700 jade and ivory ornaments, and 16 people who would tend to Lady Hao in the afterlife. Human sacrifice did not occur only at funerals. Inscribed bones report sacrifices of war captives in the dozens and hundreds.

Shang society was marked by sharp status distinctions. The king and other noble families had family and clan names transmitted along patrilineal lines, from father to son. Kingship similarly passed along patrilineal lines. The kings and the aristocrats owned slaves, many of whom had been captured in war. In the urban centers there were substantial numbers of craftsmen who worked in stone, bone, and bronze.

Shang farmers were obligated to work for their lords (making them essentially serfs). Their lives were not that different from the lives of their Neolithic ancestors, and they worked the fields with similar stone tools. They usually lived in small, compact villages surrounded by fields. Some new crops became common in Shang times, most notably wheat, which had spread from western Asia.

Bronze Metalworking

As in Egypt, Mesopotamia, and India, the development of more complex forms of social organization in Shang China coincided with the mastery of metalworking, specifically bronze. The bronze industry required the coordination of a large labor force and skilled artisans. Most surviving Shang bronze objects are vessels such as cups, goblets, steamers, and cauldrons that would have originally been used during sacrificial ceremonies.

The decoration on Shang bronzes seems to say something interesting about Shang culture, but scholars do not agree about what that is. In the art of ancient Egypt, Assyria, and Babylonia, representations of agriculture (domesticated plants and animals) and of social hierarchy (kings, priests, scribes, and slaves) are very common, matching our understandings of the social, political, and economic development of those societies. In Shang China, by contrast, images of wild animals predominate. Some animal images readily suggest possible meanings. Birds, for example, suggest to many the idea of messengers that can communicate with other realms, especially realms in the sky. More problematic is the most common image, the stylized animal face called the **taotie** (taow-tyeh). To some it is a monster — a fearsome image that would scare away evil forces. Others imagine a dragon — an animal whose vast powers had more positive associations. Some hypothesize that it reflects masks used in rituals.

Others associate it with animal sacrifices, totemism, or shamanism. Without new evidence, scholars can only speculate.

Bronze Vessels The Shang Dynasty bronze vessel on the top, dating to the twelfth century B.C.E. and about 10 inches tall, is covered with symmetrical animal imagery, including stylized taotie masks. The early Zhou Dynasty inscribed bronze pan (bottom), dating to before 900 B.C.E., was one of 103 vessels discovered in 1975 by farmers clearing a field. The inscription tells the story of the first six Zhou kings and of the family of scribes who served them.

The Development of Writing

The survival of divination texts inscribed on bones from Shang tombs demonstrates that writing was already a major element in Chinese culture by 1200 B.C.E. Writing must have been developed earlier, but the early stages cannot be traced, probably because writing was done on wood, bamboo, silk, or other perishable materials.

The invention of writing had profound effects on China’s culture and government. A written language made possible a bureaucracy capable of keeping records and corresponding with commanders and governors far from the palace. Hence literacy became the ally of royal rule, facilitating control over a wide realm. Literacy also preserved the learning, lore, and experience of early Chinese society and facilitated the development of abstract thought.

Like ancient Egyptian and Sumerian scripts, the Chinese script was **logographic**: each word was represented by a single symbol. In western Eurasia logographic scripts were eventually modified or replaced by phonetic scripts, but that never happened in China. Because China retained its logographic writing system, many years were required to gain full mastery of reading and writing, which added to the prestige of education.

logographic A system of writing in which each word is represented by a single symbol, such as the Chinese script.

Why did China retain a logographic writing system even after encounters with phonetic ones? Although phonetic systems have many real advantages, especially with respect to ease of learning to read, there are some costs to dropping a logographic system. Since characters did not change when the pronunciation changed, educated Chinese could read texts written centuries earlier without the need for translation. Moreover, as the Chinese language developed regional variants, readers of Chinese could read books and letters by contemporaries whose oral language they could not comprehend. Thus the Chinese script played a large role in holding China together and fostering a sense of connection with the past. In addition, many of China's neighbors (Japan, Korea, and Vietnam, in particular) adopted the Chinese script, allowing communication through writing between people whose languages were totally unrelated. In this regard, Chinese characters were like Arabic numerals, which have the same meaning however they are pronounced (Table 4.1).

The Early Zhou Dynasty, ca. 1050–400 B.C.E.

How was China governed, and what was life like during the Zhou Dynasty?

West of the Shang capital was the domain of Zhou (JOE), which had inherited cultural traditions from the Neolithic cultures of the northwest and absorbed most of the material culture of the Shang. In about 1050 B.C.E. the Zhou rose against the Shang and defeated them in battle. Their successors maintained the cultural and political advances that the Shang rulers had introduced.

Zhou Politics

The early Zhou period is the first one for which transmitted texts exist in some abundance. The ***Book of Documents*** (ca. 900 B.C.E.) describes the Zhou conquest of the Shang as the victory of just and noble warriors over decadent courtiers led by an irresponsible and sadistic king.

Book of Documents One of the earliest Chinese books, containing documents, speeches, and historical accounts about early Zhou rule.

Like the Shang kings, the Zhou kings sacrificed to their ancestors, but they also sacrificed to Heaven. The *Book of Documents* assumes a close relationship between Heaven and the king, who was called the Son of Heaven. In this book, Heaven gives the king a mandate to rule only as long as he rules in the interests of the people. Because the last king of the Shang had been decadent and cruel, Heaven took the mandate away from him and entrusted it to the virtuous Zhou kings. This theory of the **Mandate of Heaven** was probably developed by the early Zhou rulers as a kind of propaganda to win over the former subjects of the Shang. It remained a central feature of Chinese political ideology from the early Zhou period on.

Mandate of Heaven The theory that Heaven gives the king a mandate to rule only as long as he rules in the interests of the people.

Rather than attempt to rule all their territories directly, the early Zhou rulers set up a decentralized feudal system. They sent relatives and trusted subordinates with troops to establish walled garrisons in the conquered territories. Such a vassal was generally able to pass his position on to a son, so that in time the domains became hereditary. By 800 B.C.E. there were about two hundred lords with domains large and small.

As generations passed and ties of loyalty and kinship grew more distant, regional lords became so powerful that they no longer obeyed the commands of the king. In 771 B.C.E. the Zhou king was killed by an alliance of non-Chinese tribesmen and Zhou vassals. One of his sons was put on the throne, and then for safety's sake the capital was moved east to modern Luoyang, just south of the Yellow River in the heart of the central plains (see Map 4.2). However, the revived Zhou Dynasty never fully regained control over its vassals, and China entered a prolonged period without a strong central authority and with nearly constant conflict (the later Zhou Dynasty, also called the Warring States Period).

Life During the Early Zhou Dynasty

During the early Zhou period, aristocratic attitudes and privileges were strong. Inherited ranks placed people in a hierarchy ranging downward from the king to the rulers of states with titles like duke and marquis, to the hereditary great officials of the states, to the lower ranks of the aristocracy — men who could serve in either military or civil capacities, known as **shi** — and finally to the ordinary people (farmers, craftsmen, and traders). Patrilineal family ties were very important in this society, and at the upper reaches, at least, sacrifices to ancestors were one of the key rituals used to forge social ties.

shi The lower ranks of Chinese aristocracy; these men could serve in either military or civil capacities.

Glimpses of what life was like at various social levels in the early Zhou Dynasty can be found in the ***Book of Songs*** (ca. 900 B.C.E.), which contains the earliest Chinese poetry. Some of the songs are hymns used in court religious ceremonies, such as offerings to ancestors. Others clearly had their origins in folk songs. The seasons set the pace for rural life, and the songs contain many references to seasonal changes, such as the appearance of insects like grasshoppers and crickets. Some of these songs depict farmers clearing fields, plowing and planting, gathering mulberry leaves for silkworms, and spinning and weaving. Farming life involved not merely cultivating crops like millet, hemp (for cloth), beans, and vegetables but also hunting small animals and collecting grasses and rushes to make rope and baskets. (See “Global Viewpoints: The Inglorious Side of War in the *Book of Songs* and the *Patirruppattu,*” page 94.)

Book of Songs The earliest collection of Chinese poetry; it provides glimpses of what life was like in the early Zhou Dynasty.

Many of the folk songs are love songs that depict a more informal pattern of courtship than the one that prevailed in later China. One stanza reads:

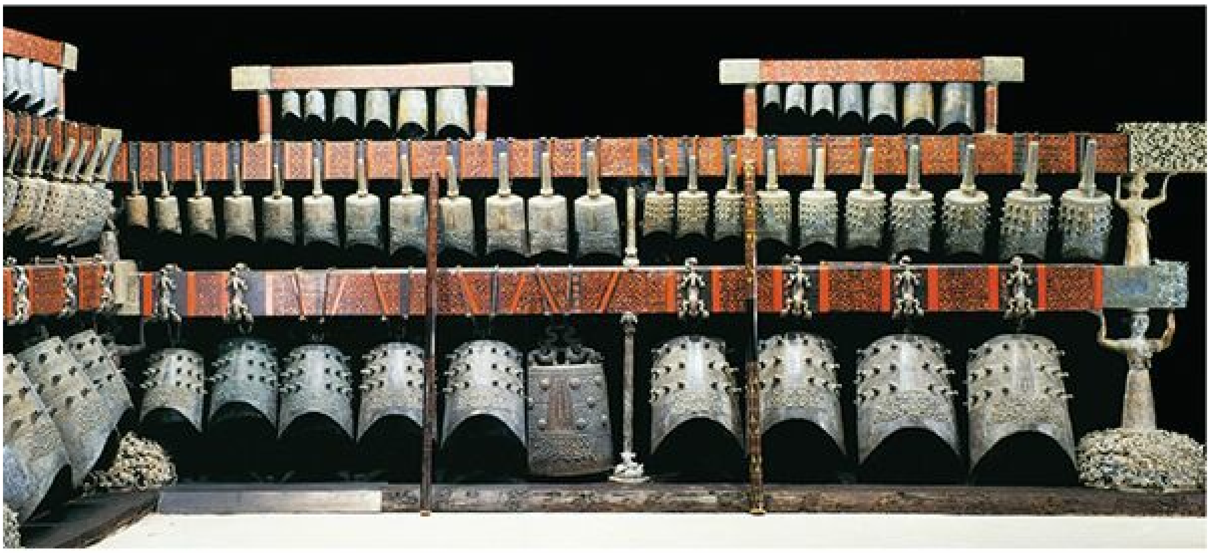
> I pray you, Zhongzi,
> Do not come leaping over my wall,
> Do not break my mulberry trees.
> It’s not that I care about them,
> But I fear the words of my brothers.
> You, Zhongzi, are to be loved,
> But my brothers’ words —
> are to be feared.[1]

There were also songs of complaint, such as this one in which the ancestors are rebuked for failing to aid their descendants:

> The drought is extreme,
> And it cannot be stopped.
> More fierce and fiery,
> it is leaving me no place.
> My end is near; —
> I have none to look up to, none to look round to.
> The many dukes and their ministers of the past
> Give me no help.
> Oh parents and ancestors,
> How can you bear to see us like this?[2]

Social and economic change quickened after 500 B.C.E. Cities began appearing all over north China. Thick earthen walls were built around the palaces and ancestral temples of the ruler and other aristocrats, and often an outer wall was added to protect the artisans, merchants, and farmers who lived outside the inner wall. Accounts of sieges launched against these walled citadels, with scenes of the scaling of walls and the storming of gates, are central to descriptions of military confrontations in this period.

The development of iron technology in the early Zhou Dynasty promoted economic expansion and allowed some people to become very rich. By 500 B.C.E. iron was being widely used for both farm tools and weapons. Late Zhou texts frequently mention trade across state borders in goods such as furs, copper, dyes, hemp, salt, and horses. People who grew wealthy from trade or industry began to rival rulers for influence. Rulers who wanted trade to bring prosperity to their states welcomed traders and began casting coins to facilitate trade.



Hubei Provincial Museum/ Uniphoto Press, Japan/Ancient Art & Architecture Collection, Ltd.

Bells of the Marquis of Zeng Music played a central role in court life in ancient China, and bells are among the most impressive bronze objects of the period. The tomb of a minor ruler who died about 400 B.C.E. contained 124 musical instruments, including drums, flutes, mouth organs, pan pipes, zithers, a set of 32 chime stones, and this 64-piece bell set. The bells bear inscriptions that name the two tones each bell could make, depending on where it was struck. Five men, using poles and mallets and standing on either side of the set of bells, would have played the bells by hitting them from outside.

Social mobility increased over the course of the Zhou period. Rulers often sent out their own officials rather than delegate authority to hereditary lesser lords. This trend toward centralized bureaucratic control created opportunities for social advancement for the *shi* on the lower end of the old aristocracy. Competition among such men guaranteed rulers a ready supply of able and willing subordinates, and competition among rulers for talent meant that ambitious men could be selective in deciding where to offer their services. (See “Individuals in Society: Lord Mengchang,” page 96.)

Religion in Zhou times was not simply a continuation of Shang practices. The practice of burying the living with the dead — so prominent in the royal tombs of the Shang — steadily declined in the middle Zhou period. New deities and cults also appeared, especially in the southern state of Chu, where areas that had earlier been considered barbarian were being incorporated into the cultural sphere of the Central States, as the core region of China was called. By the late Zhou period, Chu was on the forefront of cultural innovation and produced the greatest literary masterpiece of the era, the *Songs of Chu*, a collection of fantastical poems full of images of elusive deities and shamans who could fly through the spirit world. (See “Thinking Like a Historian: Ideas About the Divine Realm,” page 98.)

GLOBAL VIEWPOINTS

The Inglorious Side of War in the *Book of Songs* and the *Patirruppattu*

The *Book of Songs*, the earliest collection of Chinese poetry, dating back to around 900 B.C.E., includes not only poems that glorify the valiant military victor, but also ones that look at war from the side of ordinary soldiers forced to march and fight. These poems can be compared to others written by poets at court in south India, which were preserved in *Patirruppattu*, an anthology from the classical period of Tamil literature, about 200 B.C.E.–200 C.E.

Soldiers' Complaints in the *Book of Songs*

Hear, minister of war, the charge we bring!
We are the teeth and talons of the king;
  Close to his person is our place.
Why have you sent us to this homeless life,
Where far from court we roam, 'mid miseries rife?
  Why are we doomed to this disgrace

Hear, minister of war, the accusing word!
We are the taloned soldiers of our lord,
  And near his person should have rest.
But you from court have sent us far away,
Where ceaselessly we toil from day to day,
  By constant misery oppressed.

Hear, minister of war, whose erring deed
Has paid our valor with a sorry meed,
  When we should near the court reside.
Why have you sent us far to suffer grief,
And leave our mothers longing for relief,
  With all their cooking labors tried?

The Waste of War from *Patirruppattu*

HARVEST OF WAR

Great king
you shield your men from ruin,
so your victories, your greatness
are bywords.

Loose chariot wheels
lie about the battleground
with the long white tusks
of bull-elephants.

Flocks of male eagles
eat carrion
with their mates.

Headless bodies
dance about
before they fall
to the ground.

Blood glows,
like the sky before nightfall,
in the red center
of the battlefield.

Demons dance there.
And your kingdom
is an unfailing harvest
of victorious wars.

BATTLE SCENE

You might ask,
        “This Porai, so fierce in war,
        how big
        are his armies, really?”
Listen,
new travelers on the road!

As the enemy mob scampers and flees
and kings die on the field,

I’ve no body count
of those who kill as they fall,
and falling,
dance the victory dance
with lifted hands.

I’ve no count of the well-made chariots
that run all over them,
wheel-rims hardly worn,

nor of the horses, the men,
numberless,
I’ve not counted them.

And those elephants of his,
they cannot be pegged down,
they twist goads out of shape,

they stamp even on the moving shadows
of circling eagles,

and stampede like the cattle
of the Konkars
with pickax troops on a wasteland of pebbles, they really move, those elephants
in his army:
I can see them but I cannot count them.

QUESTIONS FOR ANALYSIS

1. Who is speaking in these poems?
2. What can you infer about warfare of the periods from these pieces?
3. How significant do you think it is that the Chinese poems were composed seven centuries or more before the Indian ones?

INDIVIDUALS IN SOCIETY

Lord Mengchang

© The Trustees of the British Museum/Art Resource, NY

Menchang promoted trade by issuing bronze coins. Some Zhou coins, like the ones cast in the mold shown here, were shaped liked minature knives.

DURING THE WARRING STATES PERIOD, MEN COULD RISE to high rank on the basis of talent. Lord Mengchang rose on the basis of his people skills: he treated his retainers so well that he attracted thousands of talented men to his service, enabling him to rise to prime minister of his native state of Qi in the early third century B.C.E.

Lord Mengchang's beginnings were not promising. His father, a member of the Qi royal family, already had more than forty sons when Mengchang was born, and he ordered the mother, one of his many concubines, to leave the baby to die. She, however, secretly reared him, and while still a child he was able to win his father's approval through his cleverness.

At his father’s death Mengchang succeeded him. Because Mengchang would provide room and board to men who sought to serve him, he soon attracted a few thousand retainers, many of humble background, some fleeing justice. Every night, we are told, he ate with them all in his hall, treating them equally no matter what their social origins.

Most of the stories about Mengchang revolve around retainers who solved his problems in clever ways. Once, when Mengchang had been sent as an envoy to Qin, the king of Qin was persuaded not to let so talented a minister return to help Qi. Under house arrest, Mengchang was able to ask one of the king’s consorts to help him, but in exchange she wanted a fur coat kept in the king’s treasury. A former thief among Mengchang’s retainers stole it for him, and Mengchang was soon on his way. By the time he reached the barrier gate, Qin soldiers were pursuing him, and he knew that he had to get through quickly. One of his retainers imitated the crowing of a cock, which got the other cocks to crow, making the guards think it was dawn, so they opened the gates and let his party through.

When Mengchang served as prime minister of Qi, his retainers came up with many clever stratagems that convinced the nearby states of Wei and Han to join Qi in resisting Qin. Several times, one of his retainers of modest origins, Feng Xuan (FUNG SCHWAN), helped Mengchang withstand the political vicissitudes of the day. When sent to collect debts owed to Mengchang in his fief of Xue, Feng Xuan instead forgave all the debts of those too poor to repay their loans. Later, when Lord Mengchang lost his post at court and returned to his fief, most of his retainers deserted him, but he found himself well loved by the local residents, all because of Feng Xuan’s generosity in his name. After Mengchang reattained his court post and was traveling back to Qi, he complained to Feng Xuan about those who had deserted him. Feng Xuan, we are told, got down from the carriage and bowed to Lord Mengchang, and when pressed said that the lord should accept the retainers’ departures as part of the natural order of things:

> Wealth and honor attract while poverty and lowliness repel; such is the nature of things. Think of it like the market. In the morning it is crowded and in the evening it is deserted. This is not because people prefer the morning to the evening, but rather because what they want can not be found there [in the evening]. Do not let the fact that your retainers left when you lost your position lead you to bar them from returning. I hope that you will treat them just the way you did before.[*]

QUESTIONS FOR ANALYSIS

1. How did Mengchang attract his many retainers, and how did their service benefit him?
2. Who in this story benefited from hereditary privilege, and who advanced because of ability? What does this suggest about social mobility during the Warring States Period?
3. Many of the stories about Mengchang are included in *Intrigues of the Warring States*, a book that Confucians disapproved of. What do you think they found objectionable?

THINKING LIKE A HISTORIAN

Ideas About the Divine Realm

Diverse ideas about the nature of gods, ghosts, ancestors, and demons can be seen in early Chinese sources of many kinds. Confucius strongly supported the practice of ritual, especially sacrifices to ancestors, but he avoided talk about gods or ghosts, preferring to focus on the human world. Written sources from the next several centuries show that interest in the divine realm remained strong. This theme can also be seen in funerary art.

1 **Mozi, from *The Mozi*.** Master Mo, in the century after Confucius, objected to many Confucian teachings, arguing that Confucius's followers spent too much time and resources on useless rituals and that they encouraged people to put their own relatives first rather than helping all impartially. He used utility as a standard, asking whether an idea or practice would lead people to act in desirable ways. He sometimes used stories to get his point across, as he does below.

■ Long ago, in the time of Lord Zhuang of Qi [794–731 B.C.E.], there were two ministers named Wangli Guo and Zhongli Jiao. These two men had been engaged in a lawsuit for three years, but no judgment had been handed down. Lord Zhuang thought of executing them both, but he was afraid of killing an innocent man. He also thought of acquitting them both, but he was afraid of setting free one who was guilty. He therefore ordered the two men to bring a lamb and take an oath on the Qi altar of the soil. The two men agreed to take the oath of blood. The throat of the lamb was cut, its blood sprinkled on the altar, and Wangli Guo's version of the case read through to the end. Zhongli Jiao's version was read, but before it had been read half through, the lamb rose up, butted Zhongli Jiao, broke his leg, and then struck him down on the altar. At that time there were none of the attendants of Qi who did not see what happened, and no one in distant regions who did not hear about it. It was recorded in the spring and autumn annals of Qi, and the feudal lords handed down the story, saying, "All those who take oaths in insincerity will incur the punishment of the ghosts and spirits with just such rapidity!" If we examine what is written in the book, how can we doubt that ghosts and spirits exist?

Therefore Mozi said: Even in the deep valleys, the broad forests, the dark and distant places where no one lives, you must not fail to act with sincerity, for the ghosts and spirits will see you even there!

2 **Xunzi, from *The Xunzi*.** Xunzi, the leading Confucian teacher of the late Warring States Period, was unusual in explicitly discussing the consequences of making appeals to the gods.

■ You pray for rain and it rains. Why? For no particular reason, I say. It is just as though you had not prayed for rain and it rained anyway. The sun and moon undergo an eclipse and you try to save them; a drought occurs and you pray for rain; you consult the arts of divination before making a decision on some important matter. But it is not as though you could hope to accomplish anything by such ceremonies. They are done merely for ornament. Hence the gentleman regards them as ornaments, but the common people regard them as supernatural.

3 **Spellbinding.** In recent decades archaeologists have found books in Warring States and Han tombs that did not survive elsewhere. Several of these texts deal with determining lucky and unlucky days, quelling demons, and other occult lore. Below is just a small selection from a lengthy text on spellbinding.

■ When without cause a demon deludes a person — this is the Enticing Demon who likes to sport with people. Make a staff from mulberry heartwood. When the demon comes, strike it. It will die of terror….

When without cause the people in a household all become diseased, most of whom suffer from nightmares and die — this is the Childbirth Demon who is buried there. There is not grass or matting above it. Dig it up and get rid of it. Then it will stop….

When without cause the stove cannot cook food — the Yang Demon has taken its vapor (qi). Burn pig feces inside the house. Then it will stop.

4 **The Songs of Chu.** Late Warring States poetry from the southern state of Chu was traditionally attributed to Qu Yuan (ca. 340–278 B.C.E.), a passionate man who threw himself into the river because his lord rejected him. In the three stanzas here from a longer poem, the author flies through the heavens in the company of gods.

■ “Open them wide, the gates of the heavens, in a mass I come riding dark purple clouds, and charge the whirlwinds to speed on ahead, commanding a downpour to moisten the dust.”

My Lord sweeps in circles, then He descends, It is I who go with you past Mount Kong-sang. “Earth’s nine domains are teeming with men; and their spans, long or short, depend upon me.”

High off we fly, steadily soaring, riding pure vapors, He drives Shadow and Light; then I and my Lord, dashing swiftly ahead, lead on the High God down to Nine Hills

5 **Painting on a coffin.** The coffin of Marquis Zeng of Yi, buried in 433 B.C.E., has pictures of nonhuman figures holding weapons; the figures are thought to be protecting the deceased.

ANALYZING THE EVIDENCE

1. What types of powers did the writers of Sources 1–4 assume spirits had?
2. Based on all the sources, do you think most educated people would have agreed with Xunzi? Why or why not?
3. Could regional differences account for some of the differences in the ideas about spirits expressed in these sources? Explain your answer.
4. Do you see any similarities between the ideas about unseen powers in early China and those in other places? If so, what are the similarities?
5. Would thinking in the ways described in these sources have much impact on how

people lived their lives? Explain your answer.

PUTTING IT ALL TOGETHER

Using the sources above, along with what you have learned in class and in this chapter, write a short essay that analyzes the diversity of ideas about spiritual beings in early China. Is there anything that ties these ideas together? Or are the differences of greater significance than the similarities?

The Warring States Period, 403–221 B.C.E.

How did advances in military technology contribute to the rise of independent states?

By 400 B.C.E. advances in military technology were undermining the old aristocratic social structure of the Zhou. Large, well-drilled infantry armies able to withstand and defeat chariot-led forces became potent military forces in the **Warring States Period**, which lasted from 403 B.C.E. to 221 B.C.E. Fueled by the development of new weaponry and war tactics, the Chinese states destroyed each other one by one until only one state was left standing — the state of Qin (CHIN).

New Technologies for War

By 300 B.C.E. states were sending out armies of a few hundred thousand drafted foot soldiers, usually accompanied by horsemen. Adding to their effectiveness was the development of the **crossbow** around 350 B.C.E. The intricate bronze trigger of the crossbow allowed a foot soldier to shoot farther than could a horseman carrying a light bow. One text of the period reports that a skilled soldier with a powerful crossbow and a sharp sword was the match of a hundred ordinary men. To defend against crossbows, soldiers began wearing armor and helmets.

crossbow A powerful mechanical bow developed during the Warring States Period.

The introduction of cavalry in this period further reduced the need for a chariot-riding aristocracy. Shooting bows and arrows from horseback was first perfected by non-Chinese peoples to the north of China proper, who at that time were making the transition to a nomadic pastoral economy. The northern state of Jin developed its own cavalry to defend itself from the attacks of these horsemen. Once it started using cavalry against other Chinese states, they too had to master the new technology. From this time on, acquiring and pasturing horses was a key component of military preparedness.

As military competition intensified, rulers wanted to increase their populations, to have more commoners to serve as foot soldiers and more craftsmen to supply weapons. To increase agricultural output, they brought new land into cultivation, drained marshes, and dug irrigation channels. They wanted to undermine the power of lords over their subjects in order to get direct access to the peasants' labor power. Serfdom thus gradually declined. Registering populations led to the extension of family names to commoners at an earlier date than anywhere else in the world.

The development of infantry armies also created the need for a new type of general, and rulers became less willing to let men lead troops merely because of aristocratic birth. In *The Art of War* (453–403 B.C.E.), Sun Wu described the ideal general as a master of maneuver, illusion, and deception. He argued that heroism is a useless virtue that leads to needless deaths. Discipline, however, is essential, and he insisted that the entire army had to be trained to follow the orders of its commanders without questioning them. He also explicitly called for use of deceit:

> War is the Way of deceit. Thus one who is competent pretends to be incompetent; one who uses [his army] pretends not to use it; one who draws near pretends to be distant; one who is distant pretends to draw near. If [the enemy desires] some advantage, entice him [with it]…. Attack where he does not expect it and go where he has not imagined. This is how military experts are victorious.[3]

The Victorious States

During the Warring States Period, states on the periphery of the Zhou realm had more room to expand than did states in the center. With access to more resources, they were able to pick off their neighbors, one after the other. Still, for two centuries the final outcome was far from clear, as alliances among states were regularly made and nearly as regularly broken.

By the third century B.C.E. there were only seven important states remaining. These states were much more centralized than their early Zhou predecessors. Their kings had eliminated indirect control through vassals and in their place dispatched royal officials to remote cities, controlling them from a distance through the transmission of documents and dismissing them at will. Before the end of the third century B.C.E. one state, Qin, conquered all of the others, a development discussed in Chapter 7.

Confucius and His Followers

What ideas did Confucius teach, and how were they spread after his death?

The Warring States Period was the golden age of Chinese philosophy, the era when the "Hundred Schools of Thought" were in competition. During the same period in which Indian sages and mystics were developing religious speculation about karma, souls, and ultimate reality (see "India's Great Religions" in Chapter 3), Chinese thinkers were arguing about the ideal forms of social and political organization and man's connections to nature.

Confucius

As a young man, Confucius (traditional dates: 551–479 B.C.E.) had served in the court of his home state of Lu without gaining much influence. After leaving Lu, he set out with a small band of students and wandered through neighboring states in search of a ruler who would take his advice. We know what he taught from the *Analects*, a collection of his sayings put together by his followers after his death. (See "Analyzing the Evidence: The Teachings of Confucius," page 102.)

The thrust of Confucius's thought was ethical rather than theoretical or metaphysical. He talked repeatedly of an ideal age in the early Zhou Dynasty when everyone was devoted to fulfilling his or her role: superiors looked after those dependent on them; inferiors devoted themselves to the service of their superiors; parents and children, husbands and wives all wholeheartedly embraced what was expected of them. Confucius saw five relationships as the basis of society: between ruler and subject; between father and son; between husband and wife; between elder brother and younger brother; and between friend and friend.

A man of moderation, Confucius was an earnest advocate of gentlemanly conduct. He redefined the term *gentleman* (*junzi*) to mean a man of moral cultivation rather than a man of noble birth. He repeatedly urged his followers to aspire to be gentlemen rather than petty men intent on personal gain. The Confucian gentleman found his calling in service to the ruler. Confucius asserted that loyal advisers should encourage their rulers to govern through ritual, virtue, and concern for the welfare of their subjects, and much of the *Analects* concerns the way to govern well. To Confucius the ultimate virtue was **ren** (humanity). A person of humanity cares about others and acts accordingly:

ren Humanity, the ultimate Confucian virtue.

> [The disciple] Zhonggong asked about humanity. Confucius said, “When you go abroad, behave to everyone as if you were receiving a great guest. Employ the people as though you were assisting at a great sacrifice. Do not do unto others what you would not have them do to you. Then neither in your country nor in your family will there be complaints against you.”[4]

In the Confucian tradition, studying texts came to be valued over speculation, meditation, and mystical identification with deities. Confucius encouraged the men who came to study with him to master the poetry, rituals, and historical traditions that we know today as Confucian classics.

ANALYZING THE EVIDENCE

The Teachings of Confucius

Confucius’s ideas are known to us primarily through the sayings recorded by his disciples in the *Analects*. Although these sayings seem to have been haphazardly arranged, several themes emerge clearly from them. The passages here were selected to show Confucius’s ideas on the morally superior gentleman, filial piety, and the best way to govern.

The Superior Man

Confucius said, “If the superior man is not grave, he will not inspire awe, and his learning will not be on a firm foundation. Hold loyalty and faithfulness to be fundamental. Have no friends who are not as good as yourself. When you have made mistakes, don’t be afraid to correct them.” (1:8)

Confucius said, “The superior man does not seek fulfillment of his appetite nor comfort in his lodging. He is diligent in his duties and careful in his speech. He associates with men of moral principles and thereby realizes himself. Such a person may be said to love learning.” (1:14)

Confucius said, “The superior man is not an implement [tool or utensil].” (2:12)

Zigong asked about the superior man. Confucius said, “He acts before he speaks and then speaks according to his action.” (2:13)

Confucius said, “The superior man understands righteousness; the inferior man understands profit.” (4:16)

Confucius said, “The superior man wants to be slow in word but diligent in action.” (4:24)

Confucius said, “The superior man is conciliatory but does not identify himself with others; the inferior man identifies with others but is not conciliatory.” (13:23)

Confucius said, “The superior man understands the higher things [moral principles]; the inferior man understands the lower things [profit].” (14:24)

Filial Piety

Young men should be filial when at home and respectful to their elders when away from home. They should be earnest and faithful. They should love all extensively and be intimate with men of humanity. When they have any energy to spare after the performance of moral duties, they should use it to study literature and the arts. (1:6)

Confucius said, “When a man’s father is alive, look at the bent of his will. When his father is dead, look at his conduct. If for three years [of mourning] he does not change from the way of his father, he may be called filial.” (1:11)

Meng Yizi asked about filial piety. Confucius said, “Never disobey.” [Later,] when Fan Chi was driving him, Confucius told him, “Mengsun asked me about filial piety, and I answered him, ‘Never disobey.’ ” Fan Chi said, “What does that mean?” Confucius said, “When parents are alive, serve them according to the rules of propriety. When they die, bury them according to the rules of propriety and sacrifice to them according to the rules of propriety.” (2:5)

Ziyu asked about filial piety. Confucius said, “Filial piety nowadays means to be able to support one’s parents. But we support even dogs and horses. If there is no feeling of reverence, wherein lies the difference?” (2:7)

Confucius said, “In serving his parents, a son may gently remonstrate with them. When he sees that they are not inclined to listen to him, he should resume an attitude of reverence and not abandon his effort to serve them. He may feel worried, but does not complain.” (4:18)

Confucius said, “When his parents are alive, a son should not go far abroad; or if he does, he should let them know where he goes.” (4:19)

On Governing

Confucius said, “A ruler who governs his state by virtue is like the north polar star, which remains in its place while all the other stars revolve around it.” (2:1)

Confucius said, “Lead the people with governmental measures and regulate them by law and punishment, and they will avoid wrongdoing but will have no sense of honor and shame. Lead them with virtue and regulate them by the rules of propriety (*li*) and they will have a sense of shame and, moreover, set themselves right.” (2:3)

Confucius said, “The common people may be made to follow it [the Way] but may not be made to understand it.” (8:9)

Zigong asked about government. Confucius said, “Sufficient food, sufficient armament, and sufficient confidence of the people.” Zigong said, “Forced to give up one of these, which would you abandon first?” Confucius said, “I would abandon the armament.” Zigong said, “Forced to give up one of the remaining two, which would you abandon first?” Confucius said, “I would abandon food. There have been deaths from time immemorial, but no state can exist without the confidence of the people.” (12:7)

Duke Jing of Qi asked Confucius about government. Confucius replied, “Let the ruler *be* a ruler, the minister *be* a minister, the father *be* a father, and the son *be* a son.” The duke said, “Excellent! Indeed when the ruler is not a ruler, the minister not a minister, the father not a father, and the son not a son, although I may have all the grain, shall I ever get to eat it?” (12:11)

Ji Kangzi asked Confucius about government, saying, “What do you think of killing the wicked and associating with the good?” Confucius replied, “In your government what is the need of killing? If you desire what is good, the people will be good. The character of a ruler is like wind and that of the people is like grass. In whatever direction the wind blows, the grass always bends.” (12:19)

The Duke of She asked about government. Confucius said, “[There is good government] when those who are near are happy and those far away desire to come.” (13:16)

The Duke of She told Confucius, “In my country there is an upright man named Gong. When his father stole a sheep, he bore witness against him.” Confucius said, “The upright men in my community are different from this. The father conceals the misconduct of the son and the son conceals the misconduct of the father. Uprightness is to be found in this.” (13:18)

QUESTIONS FOR ANALYSIS

1. What can you infer about Confucius’s opinion of rulers of his day? What were their shortcomings?
2. Which of the virtues Confucius advocates are the hardest to achieve?

The Spread of Confucian Ideas

The eventual success of Confucian ideas owes much to Confucius's followers in the three centuries following his death. The most important of them were Mencius (ca. 370–300 B.C.E.) and Xunzi (SHOON-dzuh) (ca. 310–215 B.C.E.).

Mencius, like Confucius, traveled around offering advice to rulers of various states. Over and over he tried to convert them to the view that the ruler able to win over the people through benevolent government would succeed in unifying "all under Heaven." Mencius proposed concrete political and financial measures to ease tax burdens and otherwise improve the people's lot. Men willing to serve an unworthy ruler earned his contempt, especially when they worked hard to fill the ruler's coffers or expand his territory. In one conversation, the king of Qi (CHEE) asked if it was true that the founder of the Zhou Dynasty had taken up arms against his lord, the last king of Shang. Mencius replied that that was what the histories said. The king then asked whether it was permissible for a subject to assassinate his lord, and Mencius replied that the ruler in question was a villain and a criminal, making killing him the right thing to do.

With his disciples and fellow philosophers, Mencius also discussed other issues in moral philosophy, arguing strongly, for instance, that human nature is fundamentally good, as everyone is born with the capacity to recognize what is right and act on it. Anyone who saw a baby about to fall into a well would immediately come to its rescue. This would not be because he wanted a good reputation among his friends and neighbors or because he disliked hearing the child cry, but rather because of his inborn feeling of commiseration from which other virtues can grow.

Xunzi, a half century later, took the opposite view of human nature, arguing that people are born selfish and that only through education and ritual do they learn to put moral principle above their own interest. Much of what is desirable is not inborn but must be taught:

> The son yielding to or taking over the work of his father, or a younger brother yielding to or taking over the work of his elder brother — these two lines of action are contrary to original nature and violate natural feelings. Nevertheless, the way of filial piety is the pattern and order of propriety and righteousness.[5]

Neither Confucius nor Mencius had had much actual political or administrative experience, but Xunzi had worked for many years in the court of his home state. Not surprisingly, he showed more consideration than either Confucius or Mencius for the difficulties a ruler might face in trying to rule through ritual and virtue. Xunzi was also a more rigorous thinker than his predecessors and developed the philosophical foundations of many ideas merely outlined by Confucius and Mencius. Although he did not think gods respond to rituals, he did not propose abandoning rituals, because the rites themselves have positive effects on performers and observers. Not only do they let people express feelings and satisfy desires in an orderly way, but because they specify graduated ways to perform the rites according to social rank, ritual traditions sustain the social hierarchy. Xunzi compared and contrasted ritual and music: music shapes people’s emotions and creates feelings of solidarity, while ritual shapes people’s sense of duty and creates social differentiation.

Serving Parents with Filial Piety This twelfth-century-C.E. illustration of a passage in the *Classic of Filial Piety* shows how commoners should serve their parents: by working hard at productive jobs such as farming and tending to their parents’ daily needs. The married son and daughter-in-law offer food or drink to the older couple as their own children look on, thus learning how they should treat their own parents after they become aged.

The Confucian vision of personal ethics and public service found a small but ardent following during the Warring States Period. In later centuries rulers came to see men educated in Confucian virtues as ideal advisers and officials. Neither revolutionaries nor flatterers, Confucian scholar-officials opposed bad government and upheld the best ideals of statecraft. Confucian political ideals shaped Chinese society into the twentieth century.

The Confucian vision also provided a moral basis for the Chinese family that continues into modern times. Repaying parents and ancestors came to be seen as a sacred duty. Because people owe their very existence to their parents, they should reciprocate by respecting their parents, making efforts to please them, honoring their memories, and placing the interests of the family line above personal preferences, all of which were aspects of **filial piety**. Since the family line is a patrilineal line from father to son to grandson, placing great importance on it has had the effect of devaluing women.

Daoism, Legalism, and Other Schools of Thought

How did the teachings of Daoism, Legalism, and other schools of thought differ from those of Confucianism?

During the Warring States Period, rulers took advantage of the destruction of states to recruit newly unemployed men to serve as their advisers and court assistants. Lively debate often resulted as these strategists proposed policies and refuted opponents. Followers took to recording their teachers' ideas, and the circulation of these "books" (rolls of silk, or strips of wood or bamboo tied together) served to stimulate further debate. (See "Analyzing the Evidence: Inscribed Bamboo Slips," page 104.)

Many of these schools of thought directly opposed the ideas of Confucius and his followers. Most notable were the Daoists, who believed that the act of striving to improve society only made it worse, and the Legalists, who argued that a strong government depended not so much on moral leadership as on effective laws and procedures.

ANALYZING THE EVIDENCE

Newly discovered texts have recently added considerably to our knowledge of China in the Warring States Period. The wooden strips depicted here were part of a large cache discovered in 1993 in a late-fourth-century-B.C.E. tomb at Guodian, in the region of the Warring States state of Chu (modern Hubei province). This site is particularly rich in philosophical texts. Other tombs in the region have been found containing many other types of books: treatises on military matters, medicine, divination, mathematics, and gods, not to mention versions of the classics that vary from previously known versions in significant ways. One of the most recent discoveries was a multiplication table for numbers up to 99.5, perhaps used by a local official to calculate land area or taxes.

Presumably these texts were placed in tombs because they had meant a lot to the occupant, much the way other objects from daily life were placed there, such as musical instruments and ritual vessels. Military officers have been found buried with their military manuals, administrators with legal regulations, teachers with works of literature and philosophy, and so on.

It is the geography of the Chu region that made it possible for these texts to survive. The area has many lakes and streams, and wooden or bamboo objects that ended up below the water table were protected from air exposure, slowing down decomposition.

The physical form of these books is worth noting. These books survive as a set of wooden or bamboo strips with writing on them. Before the introduction of paper in the first century C.E., writing was regularly done on these hard materials, which were much less expensive than silk and were also used as a surface for writing. Using a brush, the writer would begin at the top of the strip and write one character under another for the length of the strip. For longer texts, a set of strips would be strung together and rolled up like a scroll. If a change needed to be made in a text, the unwanted words would be scraped off with a knife.

These texts have posed many challenges to archaeologists and paleographers (scholars of ancient scripts). Scholars working on deciphering these texts are often unsure whether a character they do not recognize is a variant of a known character or a word not previously seen. Because the cords have rotted and many strips have broken, sometimes the order of the strips is uncertain. Are passages not in any known text from a lost section of a known book or from a text no one knew about? Nevertheless, many texts have been reconstructed, and the results indicate that the intellectual life of the Warring States Period was even richer than previously thought.

QUESTIONS FOR ANALYSIS

1. Looking at the strips, can you spot any repeated characters? Can you see any very simple characters?
2. How would reading a text on slips of wood or bamboo have differed from reading one on silk or paper?
3. How would the transmission of texts be affected by their material form? Would certain types of errors be more likely when the text was preserved this way than when it was preserved through memorization and oral transmission?

Daoism

Confucius and his followers believed in moral action. They thought men of virtue should devote themselves to making the government work to the benefit of the people. Those who came to be labeled Daoists disagreed. They thought striving to make things better generally made them worse. They sought to go beyond everyday concerns and to let their minds wander freely. Rather than making human beings and human actions the center of concern, they focused on the larger scheme of things, the whole natural order identified as the Way, or **Dao** (DOW).

Dao The Way, a term used by Daoists to refer to the natural order.

Early Daoist teachings are known from two surviving books, the *Laozi* and the *Zhuangzi*, both dating to the third century B.C.E. Laozi (LOU-dzuh), the putative author of the *Laozi*, may not be a historical figure, but the text ascribed to him has been of enduring importance. A recurrent theme in this brief, aphoristic text is the mystical superiority of yielding over assertion and silence over words: “The Way that can be discussed is not the constant Way.” Because purposeful action is counterproductive, the ruler should let people return to a natural state of ignorance and contentment:

> Do not exalt the worthy, so that the people shall not compete.
> Do not value rare treasures, so that the people shall not steal.
> Do not display objects of desire, so that the people’s hearts shall not be disturbed.
> Therefore in the government of the sage,
> He keeps their hearts vacuous,
> Fills their bellies,
> Weakens their ambitions,
> And strengthens their bones.
> He always causes his people to be without knowledge or desire,
> And the crafty to be afraid to act.
> By acting without action, all things will be in order.[6]

In the philosophy of the *Laozi*, the people would be better off if they knew less, gave up tools, renounced writing, stopped envying their neighbors, and lost their desire to travel or engage in war.

Zhuangzi (JWANG-dzuh) (369–286 B.C.E.), the author of the book of the same name, shared many of the central ideas of the *Laozi*. The

Zhuangzi is filled with parables, flights of fancy, and fictional encounters between historical figures, including Confucius and his disciples. A more serious strain of Zhuangzi's thought concerned death. He questioned whether we can be sure life is better than death. When a friend expressed shock that Zhuangzi was not weeping at his wife's death but rather singing, Zhuangzi explained:

> When she died, how could I help being affected? But as I think the matter over, I realize that originally she had no life; and not only no life; she had no form; not only no form, she had no material force. In the limbo of existence and non-existence, there was transformation and the material force was evolved. The material force was transformed to be form, form was transformed to become life, and now birth has transformed to become death. This is like the rotation of the four seasons, spring, summer, fall, and winter. Now she lies asleep in the great house [the universe]. For me to go about weeping and wailing would be to show my ignorance of destiny. Therefore I desist.[7]

Zhuangzi was similarly iconoclastic in his political philosophy. In one parable a wheelwright insolently tells a duke that books are useless because all they contain are the dregs of men long dead. The duke, offended, threatens execution unless the wheelwright can explain his remark. The wheelwright responds by arguing that truly skilled craftsmen respond to situations spontaneously; they do not analyze or reason or even keep in mind the rules they have mastered. The most important truths they know cannot be written down or even explained to others. This strain of Daoist thought denies the validity of verbal reasoning and the sorts of knowledge conveyed through words.

Daoism can be seen as a response to Confucianism, a rejection of many of its basic premises. Nevertheless, over the course of Chinese history, many people felt the pull of both Confucian and Daoist ideas and studied the writings of both schools. Even Confucian scholars who had devoted much of their lives to public service might find that the teachings of the *Laozi* or *Zhuangzi* helped to put their frustrations in perspective.

Legalism

Over the course of the fourth and third centuries B.C.E., one small state after another was conquered, and the number of surviving states dwindled. Rulers fearful that their states might be next were ready to listen to political theorists who claimed expertise in the accumulation of power. These theorists, labeled **Legalists** because of their emphasis on the need for rigorous laws, argued that strong government depended not on the moral qualities of the ruler and his officials, as Confucians claimed, but on the establishment of effective laws and procedures. Legalism, though eventually discredited, laid the basis for China’s later bureaucratic government.

Legalists Political theorists who emphasized the need for rigorous laws and laid the basis for China’s later bureaucratic government.

In the fourth century B.C.E. the western state of Qin radically reformed itself along Legalist lines. The king of Qin abolished the aristocracy. Social distinctions were to be based on military ranks determined by the objective criterion of the number of enemy heads cut off in battle. In place of the old fiefs, the Qin king created counties and appointed officials to govern them according to the laws he decreed at court. To increase the population, Qin recruited migrants from other states with offers of land and houses. To encourage farmers to work hard and improve their land, they were allowed to buy and sell it. Ordinary farmers were thus freed from serf-like obligations to the local nobility, but direct control by the state could be even more onerous. Taxes and labor service obligations were heavy. Travel required a permit, and vagrants could be forced into penal labor service. All families were grouped into mutual responsibility groups of five and ten families; whenever anyone in the group committed a crime, all the others were equally liable unless they reported it.

Inlaid Wine Flask In the same period when the Hundred Schools of Thought competed, bronze craftsmen developed new and imaginative ways to decorate bronze vessels. The lively diagonal design on this bronze wine flask was created by pounding silver into planned spaces.

Legalism found its greatest exponent in Han Feizi (ca. 280–233 B.C.E.), who had studied with the Confucian master Xunzi but had little interest in Confucian values of goodness or ritual. In his writings he warned rulers of the political pitfalls awaiting them. They had to be careful where they placed their trust, for “when the ruler trusts someone, he falls under that person’s control.” Given subordinates’ propensities to pursue their own selfish interests, the ruler should keep them ignorant of his intentions and control them by manipulating competition among them. Warmth, affection, or candor should have no place in his relationships with others.

In Han Feizi’s view, if rulers would make the laws and prohibitions clear and the rewards and punishments automatic, then the officials and common people would be easy to govern. Uniform laws get people to do things they would not otherwise be inclined to do, such as work hard and fight wars; such laws are thus essential to the goal of establishing hegemony over all the other states.

The laws of the Legalists were designed as much to constrain officials as to regulate the common people. The third-century-B.C.E. tomb of a Qin official has yielded statutes detailing the rules for keeping accounts, supervising subordinates, managing penal labor, conducting investigations, and many other responsibilities of officials. Infractions were generally punishable through the imposition of fines.

Legalism saw no value in intellectual debate or private opinion. Divergent views of right and wrong lead to weakness and disorder. The ruler should not allow others to undermine his laws by questioning them. In Legalism, there were no laws above or independent of the wishes of the rulers, no laws that might set limits on rulers’ actions in the way that natural or divine laws did in Greek thought.

Rulers of several states adopted some Legalist ideas, but only the state of Qin systematically followed them. The extraordinary but brief success Qin had with these policies is discussed in Chapter 7.

Yin and Yang

Confucians, Daoists, and Legalists had the greatest long-term impact on Chinese civilization, but the Hundred Schools of Thought also included everyone from logicians, hedonists, and utopians to natural philosophers who analyzed the workings of nature.

A key idea developed by the natural philosophers was the concept of **yin and yang**, first described in the divination manual called the *Book of Changes* (ca. 900 B.C.E.), and developed into much more elaborate theories by late Zhou theorists. Yin is the feminine, dark, receptive, yielding, negative, and weak; yang is the masculine, bright, assertive, creative, positive, and strong. Yin and yang are complementary poles rather than distinct entities or opposing forces. The movement of yin and yang accounts for the transition from day to night and from summer to winter. These models based on observation of nature were extended to explain not only phenomena we might classify as natural, such as illness, storms, and earthquakes, but also social phenomena, such as the rise and fall of states and conflict in families. In all these realms, unwanted things happen when the balance between yin and yang gets disturbed.

In recent decades archaeologists have further complicated our understanding of early Chinese thought by unearthing records of the popular religion of the time — astrological manuals, handbooks of lucky and unlucky days, medical prescriptions, exercises, and ghost stories. The tomb of an official who died in 316 B.C.E., for example, has records of divinations showing that illness was seen as the result of unsatisfied spirits or malevolent demons, best dealt with through performing exorcisms or offering sacrifices to the astral god Taiyi (Grand One).

Chapter Summary

After several thousand years of Neolithic cultures, Bronze Age civilization developed in China, with cities, writing, and sharp social distinctions. Shang kings led armies and presided at sacrifices to the high god Di and the royal ancestors. The Shang armies' bronze-tipped weapons and chariots gave them technological superiority over their neighbors. War booty, including slaves who were often sacrificed to the gods, provided the Shang king with revenue.

The Zhou Dynasty, which overthrew the Shang in about 1050 B.C.E., parceled out its territory to hereditary lords. The earliest Chinese books date to this period. The *Book of Documents* provides evidence of the belief in the Mandate of Heaven, which justified Zhou rule. The *Book of Songs* offers glimpses into what life was like for elites and ordinary people alike in the early Zhou.

By the Warring States Period, which began in 403 B.C.E., the old domains had become independent states. As states destroyed each other, military technology made many advances, including the introduction of cavalry, infantry armies, and the crossbow. This was also the golden age of Chinese philosophy. Confucius and his followers promoted the virtues of sincerity, loyalty, benevolence, filial piety, and duty. Mencius urged rulers to rule through goodness and argued that human nature is good. Xunzi stressed the power of ritual and argued that human nature is selfish and must be curbed through education. Daoists and Legalists rejected all these ideas. The Daoists Laozi and Zhuangzi looked beyond the human realm to the entire cosmos and spoke of the relativity of concepts such as good and bad and life and death. Legalists heaped ridicule on the Confucian idea that a ruler could get his people to be good by being good himself and proposed instead rigorous laws with strict rewards and punishments. Natural philosophers explained the changes of seasons and health and illness in terms of the complementary forces of yin and yang.

CONNECTIONS

China's transition from Neolithic farming villages to a much more advanced civilization with writing, metalworking, iron coinage, crossbows, philosophical speculation, and competing states occurred centuries later than in Mesopotamia or India, but by the Warring States Period China was at much the same stage of development as other advanced societies in Eurasia. Although many elements of

China’s civilization were clearly invented in China — such as its writing system, its method of casting bronze, and its Confucian philosophy — it also adopted elements that diffused across Asia, such as the cultivation of wheat, the horse-driven chariot, and riding horseback.

Greece, the subject of the next chapter, is located very close to the ancient Near Eastern civilizations, so it developed more rapidly, as it was able to borrow many elements of civilization from its neighbors. It was also much smaller than China, yet in time had enormous impact on the wider world. If we keep India and China in mind, the originality of the political forms and ideas of early Greece will stand out more clearly. We return to China’s history in Chapter 7, after looking at Greece and Rome.

Review the Main Ideas

Answer the focus questions from each section of the chapter.

1. What was the impact of China's geography on the development of Chinese societies? (p. 88)
2. What was life like during the Shang Dynasty, and what effect did writing have on Chinese culture and government? (p. 89)
3. How was China governed, and what was life like during the Zhou Dynasty? (p. 92)
4. How did advances in military technology contribute to the rise of independent states? (p. 95)
5. What ideas did Confucius teach, and how were they spread after his death? (p. 100)
6. How did the teachings of Daoism, Legalism, and other schools of thought differ from those of Confucianism? (p. 103)

Make Comparisons and Connections

Analyze the larger developments and continuities within and across chapters.

1. Which features of early China's history seem closest to developments in other early civilizations, such as Mesopotamia, Egypt, and India?
2. Why do we refer to the ideas developed in India in the second half of the first millennium B.C.E. as religion and to those developed in China during the same period as philosophy? Is this a useful distinction? Why or why not?
3. Do Chinese Legalist ideas resemble ideas developed by other societies, including much more modern societies?

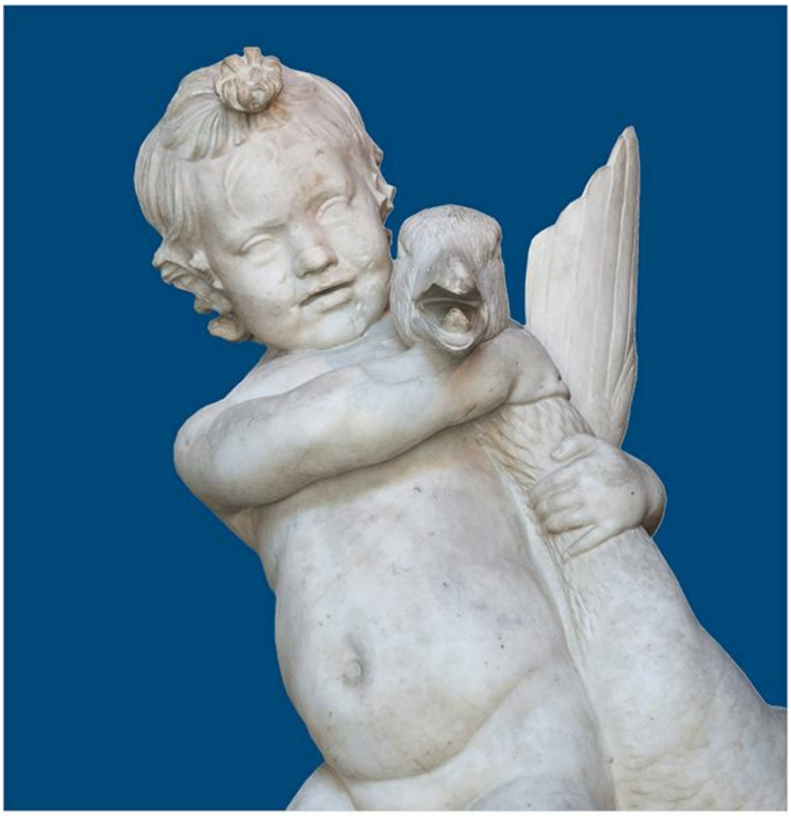
The Greek Experience

3500–30 B.C.E.



Glyptothek, Stalliche Antikensammlung, Munich, Germany/© Vanni Archive/Art Resource, NY

Greek Boy with Goose

In the Hellenistic culture that developed across a huge area after Alexander the Great’s conquests, wealthy urban residents wanted art that showed real people rather than gods. This statue of a little boy wrestling a goose, originally carved about 200 B.C.E., no doubt found an eager buyer.

Humans came into Greece over many thousands of years, in waves of migrants whose place of origin and cultural characteristics have been the source of much scholarly debate. The people of ancient Greece built on the traditions and ideas of earlier societies to develop a culture that fundamentally shaped the civilization of the western part of Eurasia, much as the Chinese culture shaped the civilization of the eastern part. The Greeks were the first in the Mediterranean and neighboring areas to explore many of the questions about the world around them and the place of humans in it that continue to concern thinkers today. Drawing on their day-to-day experiences as well as logic and empirical observation, they developed ways of understanding and explaining the world around them, which grew into modern philosophy and science. They also created new political forms and new types of literature and art.

Historians, archaeologists, and classicists divide the history of the Greeks into three broad periods: the Helladic period, which covered the Bronze Age, roughly 3000 B.C.E. to 800 B.C.E.; the Hellenic period, from the Bronze Age Collapse to the death of Alexander the Great, the ruler of Macedonia who conquered Greece, in 323 B.C.E.; and the Hellenistic period, stretching from Alexander's death to the Roman conquest in 30 B.C.E. of the kingdom established in Egypt by Alexander's successors. During the Hellenic period, Greeks developed a distinctive form of city-state known as the polis and made lasting cultural and intellectual achievements. During the Hellenistic period, Macedonian and Greek armies defeated the Persian Empire and built new cities and kingdoms, spreading Greek ideas as far as India (see "Western Contact and the Mauryan Unification of North India" in Chapter 3). During their conquests they blended their ideas and traditions with those of the societies they encountered, creating a vibrant culture.

Hellas, as the Greeks call their land, encompasses the Greek peninsula with its southern peninsular extension, known as the Peloponnesus (peh-luh-puh-NEE-suhs), and the islands surrounding it, an area known as the Aegean (ah-JEE-uhn) basin (Map 5.1). During the Bronze Age, which for Greek history is called the "Helladic period," early settlers in Greece began establishing small communities contoured by the mountains and small plains that shaped the land. The geographical fragmentation of Greece encouraged political fragmentation. Early in Greek history several kingdoms did emerge — including the Minoan on the island of Crete and the Mycenaean on the mainland — but the rugged terrain prohibited the growth of a great empire like those of Mesopotamia or Egypt.

MAP 5.1 Classical Greece, ca. 450 B.C.E. In antiquity the home of the Greeks included the islands of the Aegean and the western shore of Turkey as well as the Greek peninsula itself. Crete, the home of Minoan civilization, is the large island at the bottom of the map. The Peloponnesian peninsula, where Sparta is located, is connected to the rest of mainland Greece by a very narrow isthmus at Corinth.

The Minoans and Mycenaeans

On the large island of Crete, Bronze Age farmers and fishermen began to trade their surpluses with their neighbors, and cities grew, housing artisans and merchants. Beginning about 2000 B.C.E. Cretans voyaged throughout the eastern Mediterranean and the Aegean, carrying the copper and tin needed to make bronze as well as many other goods. Social hierarchies developed, and in many cities certain individuals came to hold power. The Cretans began to use writing about 1900 B.C.E., in a form later scholars called Linear A, a script with hundreds of signs believed to be pictographs and syllables. (For more on writing, see “Writing, Mathematics, and Poetry” in Chapter 2.) The few extant examples of this writing have not been deciphered. At about the same time that writing began, rulers in several cities of Crete began to build large structures with hundreds of interconnected rooms. The archaeologists who discovered these huge structures called them palaces, and they named the flourishing and vibrant culture of this era Minoan, after the mythical king of Crete, Minos.

Few specifics are known about Minoan political life except that a king and a group of nobles stood at its head. Minoan society was long thought to have been relatively peaceful, but new excavations are revealing more and more walls around cities, which has called the peaceful nature of Minoan society into question. In terms of their religious life, Minoans appear to have worshipped goddesses far more than gods. Whether this translated into more egalitarian gender roles for real people is unclear, but surviving Minoan art, which shows women as well as men leading religious activities, watching entertainment, and engaging in athletic competitions, such as leaping over bulls, suggests that it might have.

As Minoan culture was flourishing on Crete, a different type of society developed on the mainland. This society was founded by groups who had migrated in during the period after 2000 B.C.E. By about 1650 B.C.E. one group of these immigrants had raised palaces and established cities at Thebes, Athens, Mycenae (migh-SEE-nee), and elsewhere. These palace-centers ruled by local kings formed a loose hegemony under the authority of the king of Mycenae, and the archaeologists who first discovered traces of this culture called it the Mycenaean (migh-see-NEE-ahn).

As in Crete, the political unit was the kingdom, and the king and his warrior aristocracy stood at the top of society. The seat and symbol of the king’s power was his palace, which was also the economic center of the kingdom. Palace scribes kept records with a script known as Linear B, which used roughly two hundred ideographic and syllabic signs. This script appears to have descended from Linear A, but unlike the earlier script, Linear B has been deciphered, and it is the earliest documented form of written Greek.

The available written and archaeological evidence suggests a society in which war was common. Mycenaean cities were all fortified by thick stone walls, and graves contain spears, javelins, swords, helmets, and the first examples of metal armor known in the world.

Mycenaean Dagger Blade This scene in gold and silver on the blade of an iron dagger depicts hunters armed with spears and protected by shields defending themselves against charging lions. The Mycenaeans were a robust, warlike people who enjoyed the thrill and the danger of hunting.

Contacts between the Minoans and Mycenaeans were originally peaceful, and Minoan culture and trade goods flooded the Greek mainland. But most scholars think that around 1450 B.C.E., possibly in the wake of an earthquake that left Crete vulnerable, the Mycenaeans attacked Crete, destroying many towns and occupying Knossos (NOH-sohs), Crete’s leading city. For about the next fifty years, the Mycenaeans ruled much of the island. Then, between about 1300 B.C.E. and 1100 B.C.E., various kingdoms in and beyond Greece ravaged one another in a savage series of wars that destroyed both the Minoan and Mycenaean civilizations.

The fall of the Minoans and Mycenaeans was part of what some scholars see as a general collapse of Bronze Age civilizations in the eastern Mediterranean, including the end of the Egyptian New Kingdom and the fall of the Hittite Empire (see “Migrations, Revivals, and Collapse” in Chapter 2). This collapse appears to have had a number of causes: internal economic and social problems; invasions and migrations by outsiders; changes in warfare and weaponry, particularly the adoption of iron weapons, which made foot soldiers the most important factor in battles and reduced the power of kings and wealthy nobles fighting from chariots; and natural disasters such as volcanic eruptions, earthquakes, and droughts.

The “Dark Age”

In Greece these invasions, migrations, disasters, and social problems worked together to usher in a period of poverty and disruption that historians have traditionally called the “Dark Age” of Greece (ca. 1100–800 B.C.E.). Cities were destroyed, population declined, villages were abandoned, and trade decreased. Even writing, which was not widespread before this period, was a casualty of the chaos.

The Bronze Age Collapse led to the widespread and prolonged movement of Greek peoples, both within Greece itself and beyond. They dispersed beyond mainland Greece farther south to the islands of the Aegean Sea and in greater strength across the Aegean to the shores of Anatolia in modern-day Turkey (see Map 5.1). By the conclusion of the Dark Age, the Greeks had spread their culture throughout the Aegean basin, and like many other cultures around the Mediterranean and the Near East, they had adopted iron.

Archaeological sources from the Dark Age are less rich than those from the periods that came after, so they are often used in conjunction with literary sources written in later centuries to give us a more complete picture of the era. These included tales of the heroic deeds of legendary heroes similar to the epic poems of Mesopotamia and the *Ramayana* in India. Sometime in the eighth or seventh century B.C.E. many of these were gathered together in two long epic poems: the *Iliad*, which tells the story of the Trojan War, a war similar to those fought by Mycenaean kings, and the *Odyssey*, which records the adventures of one of the heroes of that war. These poems were recited orally, and once writing was reintroduced to Greece, they were written down and attributed to a poet named Homer, though scholars debate whether Homer was an actual historical individual. The two poems present human and divine characters who are larger than life but also petty, vindictive, pouting, and deceitful, flaws that drive the action forward, usually with tragic results.

Greeks also learned about the gods and goddesses of their polytheistic system from another poet, Hesiod (HEH-see-uhd), who most scholars think lived sometime between 750 and 650 B.C.E. Hesiod’s *Theogony* combines Mesopotamian and Hittite myths with a variety of Greek oral traditions to tell a coherent story of the origin of the gods, and his *Works and Days* portrays the gods watching over the earth, looking for justice and injustice, while leaving the great mass of men and women to live lives of hard work and endless toil. (See “Analyzing the Evidence: Hesiod, *Works and Days*,” at right.)

ANALYZING THE EVIDENCE

Hesiod, *Works and Days*

According to his description of himself in *Works and Days* (ca. 700 B.C.E.), Hesiod was born in a small village he describes as “bad in winter, godawful in summer, nice never,” and had one brother, Perses, a lazy and irresponsible swindler who cheated him out of some of his inheritance but later came to him asking for money. Whether these details are true or not, they form the framework for the work, a speech full of advice addressed to his brother, but designed for a larger audience.

And now I will tell a fable for princes who themselves understand. Thus said the hawk to the nightingale with speckled neck, while he carried her high up among the clouds, gripped fast in his talons, and she, pierced by his crooked talons, cried pitifully. To her he spoke disdainfully: “Miserable thing, why do you cry out? One far stronger than you now holds you fast, and you must go wherever I take you, songstress as you are. And if I please I will make my meal of you, or let you go. He is a fool who tries to withstand the stronger, for he does not get the mastery and suffers pain besides his shame.” So said the swiftly flying hawk, the long-winged bird.

But you, Perses, listen to right and do not foster violence; for violence is bad for a poor man. Even the prosperous cannot easily bear its burden, but is weighed down under it when he has fallen into delusion. The better path is to go by on the other side towards justice; for Justice beats Outrage when she comes at length to the end of the race. But only when he has suffered does the fool learn this. For Oath keeps pace with wrong judgements. There is a noise when Justice is being dragged in the way where those who devour bribes and give sentence with crooked judgements, take her. And she, wrapped in mist, follows to the city and haunts of the people, weeping, and bringing mischief to men, even to such as have driven her forth in that they did not deal straightly with her….

To you, foolish Perses, I will speak good sense. Badness can be got easily and in shoals: the road to her is smooth, and she lives very near us. But between us and Goodness the gods have placed the sweat of our brows: long and steep is the path that leads to her, and it is rough at the first; but when a man has reached the top, then is she easy to reach, though before that she was hard….

Do not get base gain: base gain is as bad as ruin. Be friends with the friendly, and visit him who visits you. Give to one who gives, but do not give to one who does not give. A man gives to the free-handed, but no one gives to the close-fisted. Give is a good girl, but Take is bad and she brings death. For the man who gives willingly, even though he gives a great thing, rejoices in his gift and is glad in heart; but whoever gives way to shamelessness and takes something himself, even though it be a small thing, it freezes his heart….

If your heart within you desires wealth, do these things and work with work upon work.

QUESTIONS FOR ANALYSIS

1. What does Hesiod's advice suggest about his notion of the role of humans in the world and their relationship with the gods?
2. Hesiod lived just after the period of the Greek Dark Age. How does his work reflect the situation of his own society?

The Development of the Polis in the Archaic Age, ca. 800–500 B.C.E.

What was the role of the polis in Greek society?

Homer lived in the era after the Dark Age, which later historians have termed the Archaic age (800–500 B.C.E.). The most important political change in this period was the development of the **polis** (PAH-lihs) (plural *poleis [pah-LEH-is]*), a word generally translated as “city-state.” During the Archaic period, poleis established colonies throughout much of the Mediterranean, spreading Greek culture, and two particular poleis rose to prominence on the Greek mainland: Sparta and Athens.

polis Generally translated as “city-state,” it was the basic political and institutional unit of ancient Greece.

Organization of the Polis

The Greek polis was not the first form of city-state to emerge. The earliest states in Sumer were also city-states, as were many of the small Mycenaean kingdoms. What differentiated the new Greek model from older city-states was that the polis was more than a political institution — it was a community of citizens with their own customs and laws. With one exception, the poleis that emerged after 800 B.C.E. did not have kings but instead were self-governing. The physical, religious, and political forms of the polis varied from place to place, but everywhere it was relatively small, reflecting the fragmented geography of Greece. The very smallness of the polis, however, enabled Greeks to see how they fit individually into their city and thus how the individual parts made up the social whole.

The polis included a city and its surrounding countryside. The countryside was essential to the economy of the polis and provided food to sustain the entire population. The people of the polis typically lived in a compact group of houses within the city, which by the fifth century B.C.E. was generally surrounded by a wall. Another feature was a usually elevated area called the acropolis, where the people erected temples, altars, and public monuments. The polis also contained a public square or marketplace, the agora (EH-gohr-ah), where there were porticoes, shops, public buildings, and courts. The agora was the political center of the polis.

All poleis, with one exception, did not have standing armies. Instead they relied on their citizens for protection. Very rich citizens often served as cavalry, which was, however, never as important as the heavily armed infantrymen known as **hoplites**. These commoners were the backbone of the army, just as foot soldiers were in China during the Warring States Period (see “The Warring States Period” in Chapter 4). Hoplites wore bronze helmets and leather and bronze body armor, which they purchased themselves.

hoplites Heavily armed citizens who served as infantrymen and fought to defend the polis.

Spartan Hoplite This bronze figurine portrays an armed foot soldier about to strike an enemy. His massive helmet with its full crest gives his head nearly complete protection, while a metal corselet covers his chest and back, and greaves (similar to today's shin guards) protect his shins. In his right hand he carries a thrusting spear (now broken off), and in his left a large round shield.

Greek poleis had several different types of government. Sporadic periods of violent political and social upheaval often led to the takeover of power by one man, a type of government the Greeks called tyranny. Tyrants were not always oppressive rulers, however, and sometimes used their power to benefit average citizens. **Democracy** was rule by citizens, not the people as a whole. Almost all Greek cities defined a citizen as an adult man with at least one citizen parent. Thus citizens shared ancestry as well as a place of residence. Women were citizens for religious and reproductive purposes, but their citizenship did not give them the right to participate in government. Free men who were not children of a citizen, known as resident foreigners, and slaves were not citizens and had no political voice.

democracy A type of Greek government in which all citizens administered the workings of government.

Oligarchy was government by a small group of wealthy citizens. Many Greeks preferred oligarchy because it provided more political stability than did democracy. Although oligarchy was the government of the prosperous, it left the door open for political and social advancement. If members of the polis could meet property or money qualifications, they could enter the governing circle.

oligarchy A type of Greek government in which citizens who owned a certain amount of property ruled.

Overseas Expansion

The development of the polis coincided with the growth of the Greek world in both wealth and numbers, bringing new problems. The increase in population created more demand for food than the land could supply. The resulting social and political tensions drove many people to seek new homes outside of Greece (Map 5.2).

MAP 5.2 Greek Colonization, ca. 750–550 B.C.E. The Greeks established colonies along the shores of the Mediterranean and Black Seas, spreading Greek culture and creating a large trading network.

Greeks traveled throughout the Mediterranean, sailing in great numbers to Sicily and southern Italy, where there was ample space for expansion. Some adventurous Greeks sailed farther west to Sardinia, France, Spain, and perhaps even the Canary Islands. From these new outposts Greek influence extended to southern France.

In contrast to earlier military invasions and migrations of peoples, these were very often intentional colonizing ventures, organized and planned by a specific polis seeking new land for its residents, or by the losers in a political conflict within a polis who were forced to leave. Colonization changed the entire Greek world, both at home and abroad. In economic terms the expansion of the Greeks created a much larger market for agricultural and manufactured goods.

The Growth of Sparta

During the Archaic period Sparta became the leading military power in Greece. To expand their polis, the Spartans did not establish colonies but instead conquered Messenia (muh-SEE-nee-uh), a region in the southwestern Peloponnesus. They turned the Messenians into helots (HEH-luhts), unfree residents forced to work state lands. The helots soon rose in a revolt that took the Spartans thirty years to crush. Afterward, non-nobles who had shared in the fighting as foot soldiers appear to have demanded rights equal to those of the nobility and a voice in the government. Under intense pressure the aristocrats agreed to remodel the state into a new system.

The plan for the new system in Sparta was attributed to the lawgiver Lycurgus (ligh-KUHR-guhs), who may or may not have been an actual person. Political distinctions among Spartan men were eliminated, and all citizens became legally equal. Two kings, who were primarily military leaders, and a council of nobles shared executive power with five ephors (EH-fuhrs), overseers elected by the citizens. Helots worked the land, while Spartan citizens devoted their time to military training, and Sparta became extremely powerful.

In the system attributed to Lycurgus, every citizen owed primary allegiance to Sparta. Suppression of the individual along with an emphasis on military prowess led to a barracks state. Even family life was sacrificed to the polis. After long, hard military training that began at age seven, citizens became lifelong soldiers. Because men often did not see their wives or other women for long periods, not only in times of war but also in times of peace, their most meaningful relations were same-sex ones. The Spartan military leaders may have viewed such relationships as militarily advantageous because they believed that men would fight even more fiercely for lovers and comrades. An anecdote frequently repeated about one Spartan mother sums up Spartan military values. As her son was setting off to battle, the mother handed him his shield and advised him to come back either victorious and carrying the shield, or dead and being carried on it. Spartan men were expected to train vigorously, do with little, and like it, qualities reflected even today in the word *spartan*.

Spartans expected women in citizen families to be good wives and strict mothers of future soldiers. With men in military service much of their lives, women in citizen families ran the estates and owned land in their own right, and they were not physically restricted or secluded.

The Evolution of Athens

Like Sparta, Athens faced pressing social and economic problems during the Archaic period, but instead of creating a state devoted to the military, the Athenians created a state that became a democracy. For Athens, the late seventh century B.C.E. was a time of turmoil. In 621 B.C.E. Draco (DRAY-koh), an Athenian aristocrat, under pressure from small landholders and with the consent of the nobles, published the first law code of the Athenian polis. His code was harsh — and is thus the origin of the word *draconian* — but it embodied the ideal that the law belonged to all citizens. Yet the aristocracy still governed Athens oppressively, and the social and economic situation remained dire. Noble landholders continued to force small farmers and artisans into economic dependence. Many families were sold into slavery as settlement for debts, while others were exiled and their land mortgaged to the rich.

One person who recognized these problems was the aristocrat Solon (SOH-luhn). Solon condemned his fellow aristocrats for their greed and dishonesty. According to later sources, Solon's sincerity and good sense convinced other aristocrats that he was no crazed revolutionary. Moreover, he gained the trust of the common people. Around 594 B.C.E. the nobles elected him *archon* (AHR-kahn), chief magistrate of the polis, and gave him extraordinary power to reform the state.

Solon immediately freed all people enslaved for debt, recalled all exiles, canceled all debts on land, and made enslavement for debt illegal. Solon allowed non-nobles into the old aristocratic assembly, where they could vote in the election of magistrates. Later sixth-century-B.C.E. leaders further broadened the opportunities for commoners to take part in government, transforming Athens into a democracy.

The democracy functioned on the ideal that all full citizens should play a role in government. In 487 B.C.E. the election of the city's nine archons was replaced by reappointment by lot, which meant that any citizen with a certain amount of property had a chance of becoming an archon. Making laws was the responsibility of two bodies, the *boule* (BOO-lee), or council, composed of five hundred members, and the *ecclesia* (ee-KLEE-zhee-uh), the assembly of all citizens. By supervising the various committees of government and proposing bills and treaties to the ecclesia, the boule guided Athenian political life. Nonetheless, the ecclesia, open to all male citizens over eighteen years of age, had the final word through its votes.

Golden Comb This golden comb, produced about 400 B.C.E. in Scythia (see Map 5.2), shows a battle between three warriors, perhaps the three brothers who are the legendary founders of Scythia. Their dress shows a combination of Greek and Eastern details; the mounted horseman is clothed with largely Greek armor, while the warriors on foot are wearing Eastern dress. The comb may have been made by a Greek craftsman who had migrated to the Black Sea area, as the Greeks had established colonies there, but it was buried in a Scythian burial mound.

Turmoil and Culture in the Classical Period, 500–338 B.C.E.

In the classical period, how did war influence Greece, and how did the arts, religion, and philosophy develop?

From the time of the Mycenaeans, violent conflict was common in Greek society, and this did not change in the fifth century B.C.E., the beginning of what scholars later called the classical period of Greek history. First, the Greeks beat back the armies of the Persian Empire. Then, turning their spears against one another, they destroyed their own political system in a century of warfare that began with the Peloponnesian War. Although warfare was one of the hallmarks of the classical period, intellectual and artistic accomplishments were as well.

The Deadly Conflicts, 499–404 B.C.E.

In 499 B.C.E. the Greeks who lived on the western coast of what is now Turkey, an area then known as Ionia, unsuccessfully rebelled against the Persian Empire, which had ruled the area for fifty years (see “The Rise and Expansion of the Persian Empire” in Chapter 2). The Athenians provided halfhearted help to the Ionians, and in retaliation the Persians struck at Athens, only to be surprisingly defeated by the Athenian hoplites at the Battle of Marathon. In 480 B.C.E. the Persian king Xerxes (ZUHRK-seez) personally led a massive invasion of Greece. Under the leadership of Sparta, many Greek poleis, though not all, united to fight the Persians in what later historians termed the Persian wars. The larger Persian army enjoyed early success, but the tide of the war quickly turned and the invasion ended in failure.

The victorious Athenians and their allies then formed the Delian League, a military alliance intended to liberate Ionia from Persian rule and keep the Persians out of Greece. The Athenians, however, turned the league into an Athenian empire. They reduced their allies to the status of subjects. Athenian ideas of freedom and democracy did not extend to the citizens of other cities, and cities that objected to or revolted over Athenian actions were put down.

The Delian League, ca. 478–431 B.C.E.

Under their great leader Pericles (PEHR-uh-kleez) (ca. 494–429 B.C.E.), the Athenians grew so powerful and aggressive that they alarmed Sparta and its allies. In 431 B.C.E. Athenian imperialism finally drove Sparta into the conflict known as the Peloponnesian War. The Peloponnesian War lasted a generation (431–404 B.C.E.) and brought in its wake disease, widespread civil wars, destruction, famine, and huge loss of life. In 404 B.C.E. the Athenians finally surrendered to Sparta and its allies, and Sparta stripped it of its empire. Conflicts among the states of Greece continued, however.

Athenian Arts in the Age of Pericles

In the midst of the warfare of the fifth century B.C.E., Pericles turned Athens into the showplace of Greece. He appropriated Delian League money to pay for a huge building program to rebuild the city that had been destroyed during the Persian occupation in 480 B.C.E. and to display to all Greeks the glory of the Athenian polis. Workers erected temples and other buildings as patriotic memorials housing statues and carvings, often painted in bright colors, showing the gods in human form and celebrating the Athenian victory over the Persians. (The paint later washed away, leaving the generally white sculpture that we think of as “classical.”) The Acropolis in the center of the city was crowned by the Parthenon, a temple that celebrated the greatness of Athens and its patron goddess, Athena, who was represented by a huge statue. (See “Analyzing the Evidence: The Acropolis of Athens,” page 122.) Sculptors in Athens increasingly based their statues of gods and heroes on studies of actual human anatomy. Accordingly, the statues showed realistic musculature, although the figures were always depicted in the prime form of young adulthood and with a noble facial expression, as befit a deity. Most large-scale Greek paintings have been lost, but Greek pottery was frequently decorated with painted figures and scenes that sometimes show more ordinary humans as well as divine figures. These men and women also had realistic musculature and expressions, and they are going about the ordinary tasks of daily life — working, cooking, going in and out of doors.

Other aspects of Athenian culture were also rooted in the life of the polis. The polis sponsored plays as part of the city’s religious festivals and required wealthy citizens to pay the expenses of their production. Many plays were highly controversial, with overt political and social commentary, but they were neither suppressed nor censored. Not surprisingly, given the incessant warfare, conflict was a constant element in Athenian drama, and playwrights used their art in attempts to portray, understand, and resolve life's basic conflicts.

Aeschylus (EHS-kuh-luhs) (525–456 B.C.E.) was the first dramatist to explore such basic questions as the rights of the individual, the conflict between the individual and society, and the nature of good and evil. In his trilogy of plays, *The Oresteia*, he treats the themes of betrayal, murder, and reconciliation, urging the use of reason and justice to reconcile fundamental conflicts.

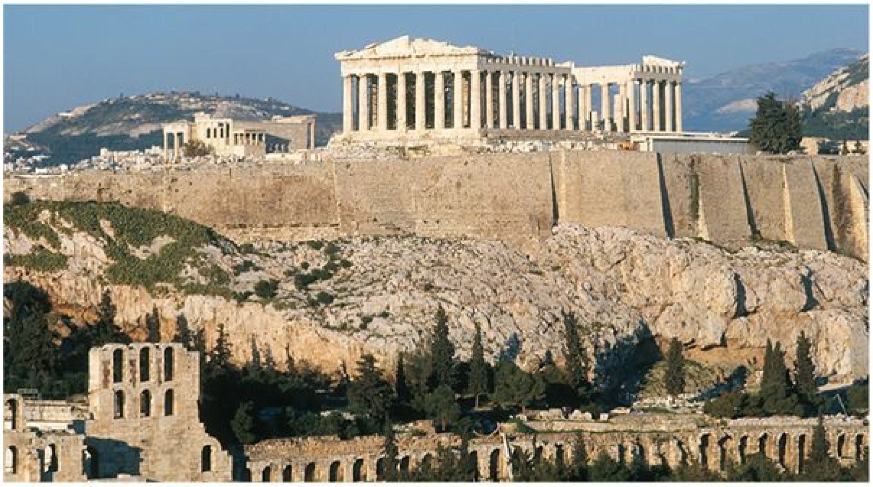
The plays of Sophocles (SAH-fuh-kleez) (496–406 B.C.E.) also deal with matters personal, political, and divine. In *Antigone* — which tells of how a king's mistakes in judgment lead to the suicides of his son, his son's fiancée, and his wife — Sophocles emphasizes the precedence of divine law over political law and family custom. In *Oedipus the King*, Sophocles tells the story of a good man doomed by the gods to kill his father and marry his mother. When Oedipus fails to avoid his fate, he blinds himself in despair and flees into exile. In *Oedipus at Colonus*, Sophocles treats the last days of the broken man, whose patient suffering and uncomplaining piety ultimately win the blessings and honor of the gods.

Euripides (yoo-RIH-puh-deez) (ca. 480–406 B.C.E.) likewise explored the theme of personal conflict within the polis and sounded the depths of the individual. With Euripides drama entered a new and more personal phase. To him the gods mattered far less than people.

Athens also produced writers of comedies, who used humor as political commentary in an effort to suggest and support the best policies for the polis. Best known of the comedians is Aristophanes (eh-ruh-STAH-fuh-neez) (ca. 445–386 B.C.E.), a merciless critic of cranks, quacks, and fools. He used his art of sarcasm to dramatize his ideas on the right conduct of citizens and their leaders for the good of the polis.

ANALYZING THE EVIDENCE

The Acropolis of Athens



Marie Mauzy/Art Resource, NY

The natural rock formation of the Acropolis probably had a palace on top as early as the Mycenaean period, when it was also surrounded by a defensive wall. Temples were constructed beginning in the sixth century B.C.E., and after the Persian wars Pericles ordered the reconstruction and expansion of many of these, as well as the building of new and more magnificent temples and an extension of the defensive walls. The largest building is the Parthenon, a temple dedicated to the goddess Athena, which originally housed a 40-foot-tall statue of Athena made of ivory and gold sheets attached to a wooden frame. Near it were smaller temples built to commemorate the victory over the Persians. Much of the Parthenon was damaged when it was shelled during a war between Venice and the Ottoman Empire in the seventeenth century, and air pollution continues to eat away at the marble.

The Athenians normally hiked up the long approach to the Acropolis only for religious festivals, of which the most important and joyous was the Great Panathenaea, held every four years to honor the virgin goddess Athena and perhaps offer sacrifices to older deities as well. For this festival, Athenian citizens and legal noncitizen residents formed a huge procession to bring the statue of Athena in the Parthenon an exquisite robe, richly embroidered by the citizen women of Athens with mythological scenes. After the religious ceremonies, all the people joined in a feast.

QUESTIONS FOR ANALYSIS

1. Look at the Parthenon in the center of the photograph. What words would you use to describe the building and its style?
2. Imagine yourself as an Athenian walking up the hill toward the Parthenon. What impression would the setting and the building itself convey?

Families and Sexual Relations

The Athenians, like other Greeks, lived with comparatively few material possessions in houses that were rather simple. A typical Athenian house consisted of a series of rooms opening onto a central courtyard that contained a well, an altar, and a washbasin. Larger houses often had a front room where the men of the family ate and entertained guests, as well as women’s quarters at the back. Meals consisted primarily of various grains, especially wheat and barley, as well as lentils, olives, figs, grapes, fish, and a little meat, foods that are now part of the highly touted “Mediterranean diet.”

In the city a man might support himself as a craftsman, or he could contract with the polis to work on public buildings. Certain crafts, including spinning and weaving, were generally done by women. Men and women without skills worked as paid laborers. Slavery was commonplace in Greece, as it was throughout the ancient world. Slaves, who were paid for their work, were usually foreigners.

Hetaera and Man at a Dinner Party In this scene painted on the inside of a drinking cup, a hetaera (one of Athens’s sophisticated courtesans known for their intellectual accomplishments as well as sexual allure) strokes the beard of a man who holds a drinking cup. Sexual and comic scenes were common on Greek pottery, particularly on objects that would have been used at a private dinner party hosted by a citizen, known as a symposium. Wives did not attend symposia, but hetaerae and entertainers were often hired to perform for the male guests.

Citizenship was the basis of political power for men in ancient Athens, and was inherited. After the middle of the fifth century, only those whose parents were both citizens were citizens, except for a few men given citizenship as a reward for service to the city. Adult male citizens were expected to take part in political decisions and be active in civic life, no matter what their occupation. They were also in charge of relations between the household and the wider community. (See “Thinking Like a Historian: Gender Roles in Classical Athens,” page 124.)

Women in Athens and elsewhere in Greece, like those in Mesopotamia, brought dowries to their husbands upon marriage, which went back to their fathers in cases of divorce. Women did not play a public role in classical Athens, and we know the names of no female poets, artists, or philosophers. Women in wealthier citizen families probably spent most of their time at home, leaving the house only to attend some religious festivals, and perhaps occasionally plays. The main function of women from citizen families was to bear and raise children. In their quarters of the house women oversaw domestic slaves and hired labor, and together with servants and friends worked wool into cloth. Women from noncitizen families lived freer lives, although they worked harder and had fewer material comforts. They performed manual labor in the fields or sold goods and services in the agora, going about their affairs much as men did.

Same-sex relations were generally accepted in all of ancient Greece. In classical Athens part of a male adolescent citizen’s training might entail a hierarchical sexual and tutorial relationship with an older man, who most likely was married and may have had female sexual partners as well. These relationships between young men and older men were often celebrated in literature and art, in part because Athenians regarded perfection as possible only in the male. Women were generally seen as inferior to men, dominated by their bodies rather than their minds. A small number of sources refer to female-female sexual desire, the most famous of which are a few of the poems of Sappho (SEH-foh), a female poet of the sixth century B.C.E.

Same-sex relations did not mean that people did not marry, for Athenians saw the continuation of the family line as essential. Sappho, for example, appears to have been married and had a daughter. Sexual desire and procreation were both important aspects of life, but ancient Greeks did not necessarily link them.

THINKING LIKE A HISTORIAN

Gender Roles in Classical Athens

Athenian men's ideas about the proper roles for men and women, conveyed in written and visual form, became a foundation of Western notions of gender. How do the qualities they view as ideal and praiseworthy for men compare with those they view as ideal for women?

1 **Pericles's funeral oration, from Thucydides's *History of the Peloponnesian War*, 430 B.C.E.** In this speech given in honor of those who had died in the war, the Athenian leader Pericles glorifies the achievements of Athenian men and women.

■ If we look to the laws, they afford equal justice to all in their private differences; if to social standing, advancement in public life falls to reputation for capacity, class considerations not being allowed to interfere with merit; nor again does poverty bar the way, if a man is able to serve the state, he is not hindered by the obscurity of his condition.... Further, we provide plenty of means for the mind to refresh itself from business. We celebrate games and sacrifices all the year round, and the elegance of our private establishments forms a daily source of pleasure.... [I]n education, where our rivals from their very cradles by a painful discipline seek after manliness, at Athens we live exactly as we please, and yet are just as ready to encounter every legitimate danger.... We cultivate refinement without extravagance and knowledge without effeminacy; wealth we employ more for use than for show.... Again, in our enterprises we present the singular spectacle of daring and deliberation, each carried to its highest point, and both united in the same persons.... In short, I say that as a city we are the school of Hellas; while I doubt if the world can produce a man, who where he has only himself to depend upon, is equal to so many emergencies, and graced by so happy a versatility as the Athenian....

If I must say anything on the subject of female excellence to those of you who will now be in widowhood, it will be all comprised in this brief exhortation: Great will be your glory in not falling short of your natural character; and greatest will be hers who is least talked of among the men whether for good or for bad.

2 **Xenophon, *Oeconomicus*, ca. 360 B.C.E.** In a treatise on household management, the historian, soldier, and philosopher Xenophon creates a character, Isomachus, who provides his much younger wife with advice and informs her about ideal gender roles. "God" in this selection means all of the gods, personified as male; "law" is personified as female ("law gives her consent").

■ ISOMACHUS: "God made provision from the first by shaping, as it seems to me, the woman's nature for indoor and the man's for outdoor occupations. Man's body and soul He furnished with a greater capacity for enduring heat and cold, wayfaring and military marches; or, to repeat, He laid upon his shoulders the outdoor works. While in creating the body of woman with less capacity for these things," I continued, "God would seem to have imposed on her the indoor works; and knowing that He had implanted in the woman and imposed upon her the nurture of new-born babies, He endowed her with a larger share of affection for the new-born child than He bestowed upon man. And since He imposed on woman the guardianship of the things imported from without, God, in His wisdom, perceiving that a fearful spirit was no detriment to guardianship, endowed the woman with a larger measure of timidity than He bestowed on man. Knowing further that he to whom the outdoor works belonged would need to defend them against malign attack, He endowed the man in turn with a larger share of courage…. Law, too, gives her consent — law and the usage of mankind, by sanctioning the wedlock of man and wife; and just as God ordained them to be partners in their children, so the law establishes their common ownership of house and estate. Custom, moreover, proclaims as beautiful those excellences of man and woman with which God gifted them at birth. Thus for a woman to bide tranquilly at home rather than roam abroad is no dishonour; but for a man to remain indoors, instead of devoting himself to outdoor pursuits, is a thing discreditable."

3 **Aristotle, *The Politics*.** In *The Politics*, one of his most important works, Aristotle examines the development of government, which he sees as originating in the power relations in the family and household.

■ The city belongs among the things that exist by nature, and man is by nature a political animal…. The family is the association established by nature for the supply of men's everyday wants….

It is clear that the rule of the soul over the body, and of the mind and the rational element over the passionate, is natural and expedient; whereas the equality of the two or the rule of the inferior is always hurtful. The same holds good of animals in relation to men; for tame animals have a better nature than wild, and all tame animals are better off when they are ruled by man; for then they are preserved. Again, the male is by nature superior, and the female inferior; and the one rules, and the other is ruled; this principle, of necessity, extends to all mankind….

A similar question may be raised about women and children, whether they too have virtues: ought a woman to be temperate and brave and just, and is a child to be called temperate, and intemperate, or not? … Here the very constitution of the soul has shown us the way; in it one part naturally rules, and the other is subject, and the virtue of the ruler we maintain to be different from that of the subject; the one being the virtue of the rational, and the other of the irrational part. Now, it is obvious that the same principle applies generally, and therefore almost all things rule and are ruled according to nature…. For the slave has no deliberative faculty at all; the woman has, but it is without authority, and the child has, but it is immature. So it must necessarily be supposed to be with the moral virtues also; all should partake of them, but only in such manner and degree as is required by each for the fulfillment of his duty…. Clearly, then, moral virtue belongs to all of them; but the temperance of a man and of a woman, or the courage and justice of a man and of a woman, are not, as Socrates maintained, the same; the courage of a man is shown in commanding, of a woman in obeying…. All classes must be deemed to have their special attributes; as the poet says of women, "Silence is a woman's glory," but this is not equally the glory of man.

ANALYZING THE EVIDENCE

1. In Sources 1–3, what qualities do the authors see as praiseworthy in men? In women?
2. In Sources 2 and 3, what do Xenophon and Aristotle view as the underlying reasons for gender differences?
3. The two paintings in Sources 4 and 5 show scenes that were normal parts of real Athenian life, but how do they also convey ideals for men and women? What are these ideals?
4. Because no writing or art by Athenian women has survived, we have to extrapolate women's opinions from works by men. What does the body language and expression of the young woman in Source 4 suggest she thought about her situation?

PUTTING IT ALL TOGETHER

Using the sources above, along with what you have learned in class and in this chapter, write a short essay that compares ideals for men and women in classical Athens. How did these ideas about gender roles both reflect and shape Athenian society and political life?

Public and Personal Religion

Like most peoples of the ancient world, the Greeks were polytheists, worshipping a variety of gods and goddesses who were immortal but otherwise acted just like people. As elsewhere, Greek religion was primarily a matter of ritual, with rituals designed to appease the divinities believed to control the forces of the natural world. Processions, festivals, and sacrifices offered to the gods were frequently occasions for people to meet together socially. Migration, invasion, and colonization brought the Greeks into contact with other peoples and caused their religious beliefs to evolve.

By the classical era, the primary gods were understood to live metaphorically on Mount Olympus, the highest mountain in Greece. Besides these Olympian gods, each polis had its own minor deities, each with his or her own local group of worshippers. The polis administered the cults and religious festivals, and everyone was expected to participate in these civic rituals. In contrast to Mesopotamia, Egypt, and Vedic India, priests held little power in Greece; their purpose was to care for temples and sacred property and to conduct the proper rituals, but not to make religious or political rules or doctrines. Much religion was local and domestic, and individual families honored various deities privately in their homes.

Along with public and family forms of honoring the gods, some Greeks also participated in what later historians have termed **mystery religions**, in which participants underwent an initiation ritual and gained secret knowledge that they were forbidden to reveal to the uninitiated. Many of these religions promised rebirth or an afterlife to adherents.

mystery religions Belief systems that were characterized by secret doctrines, rituals of initiation, and sometimes the promise of rebirth or an afterlife.

The Greeks also shared some Pan-Hellenic festivals, the chief of which were held at Olympia to honor the god Zeus and at Delphi to honor the god Apollo. The festivities at Olympia included athletic contests that inspired the modern Olympic games. Held every four years after they started in 776 B.C.E., the contests attracted visitors from all over the Greek world and lasted until the fourth century C.E., when they were banned by a Christian emperor because they were pagan. The Pythian games at Delphi were also held every four years, and these contests included musical and literary competitions.

The Flowering of Philosophy

Just as the Greeks developed rituals to honor gods, they spun myths and epics to explain the origins of the universe. Over time, however, some Greeks began to question their old gods and myths, and they sought rational rather than supernatural explanations for natural phenomena. These Greek thinkers, based in Ionia, are called the Pre-Socratics because their rational efforts preceded those of the better-known Socrates. Taking individual facts, they wove them into general theories that led them to conclude that, despite appearances, the universe is actually simple and subject to natural laws.

Drawing on their observations, the Pre-Socratics speculated about the basic building blocks of the universe, and most decided that all things were made of four simple substances: fire, air, earth, and water. Democritus (dih-MAW-kruh-tuhs) (ca. 460–370 B.C.E.) broke this down further and created the atomic theory that the universe is made up of invisible, indestructible particles. The stream of thought started by the Pre-Socratics branched into several directions. Hippocrates (hih-PAW-kruh-teez) (ca. 470–400 B.C.E.) became the most prominent physician and teacher of medicine of his time. He sought natural explanations for diseases and natural means to treat them. Illness was caused not by evil spirits, he asserted, but by physical problems in the body, particularly by imbalances in what he saw as four basic bodily fluids: blood, phlegm, black bile, and yellow bile. In a healthy body these fluids, called humors, were in perfect balance, and medical treatment of the ill sought to help the body bring them back into balance. Hippocrates seems to have advocated letting nature take its course and not intervening too much, though later medicine based on the humoral theory would be much more interventionist, with bloodletting emerging as the central treatment for many illnesses.

The Sophists (SOFF-ihsts), a group of thinkers in fifth-century-B.C.E. Athens, applied philosophical speculation to politics and language, questioning the beliefs and laws of the polis to understand their origin. They believed that excellence in both politics and language could be taught, and they provided lessons for the young men of Athens who wished to learn how to persuade others.

Socrates (SOK-ruh-teez) (ca. 470–399 B.C.E.), whose ideas are known only through the works of others, also applied philosophy to politics and to people. His approach when exploring ethical issues and defining concepts was to start with a general topic or problem and to narrow the matter to its essentials. He did so by continuously questioning participants in a discussion or argument rather than lecturing, a process known as the Socratic method. Many Athenians viewed Socrates with suspicion because he challenged the traditional beliefs and values of Athens. His views brought him into conflict with the government. The leaders of Athens tried him for corrupting the youth of the city, and for impiety, that is, for not believing in the gods honored in the city. In 399 B.C.E. they executed him.

Most of what we know about Socrates comes from his student Plato (427–347 B.C.E.), who wrote dialogues in which Socrates asks questions and who also founded the Academy, a school dedicated to philosophy. Plato developed the theory that there are two worlds: the impermanent, changing world that we know through our senses, and the eternal, unchanging realm of "forms" that constitute the essence of true reality. According to Plato, true knowledge and the possibility of living a virtuous life come from contemplating ideal forms — what later came to be called **Platonic ideals** — not from observing the visible world.

Platonic ideals In Plato's thought, the eternal unchanging ideal forms that are the essence of true reality.

Plato's student Aristotle (384–322 B.C.E.) believed that true knowledge came from observation of the world, analysis of natural phenomena, and logical reasoning, not contemplation. Aristotle thought that everything had a purpose, so that to know something, one also had to know its function. The range of Aristotle's thought is staggering. His interests embraced logic, ethics, natural science, physics, politics, poetry, and art. He studied the heavens as well as earth and judged the earth to be the center of the universe, with the stars and planets revolving around it. Plato's idealism profoundly shaped Western philosophy, but Aristotle came to have an even wider influence. For many centuries in Europe, the authority of his ideas was second only to the Bible's, and his ideas had a great impact in the Muslim world as well.

Religious Procession in Hellenic Greece This painted wooden slab from about 540 B.C.E., found in a cave near Corinth, shows adults and children about to sacrifice a sheep to the deities worshipped in this area. The participants are dressed in their finest clothes and crowned with garlands. Music adds to the festivities. Rituals such as this were a common part of religious life throughout Greece. The boys are shown with tanned skin and women with white, reflecting the ideal that men’s lives took place largely outside in the sun-filled public squares, and women’s in the shaded interiors of homes. The woman at the front of the procession has her hair up, indicating her married status, while the women at the rear have the long uncovered hair of unmarried women.

The philosophers of ancient Athens lived at roughly the same time as major thinkers in religious and philosophical movements in other parts of the world, including Mahavira (the founder of Jainism), the Buddha, Confucius, and several prophets in Hebrew Scripture. All of these individuals thought deeply about how to live a moral life, and all had tremendous influence on later intellectual, religious, and social developments. There is no evidence that they had any contact with one another, but the parallels among them are strong enough that some historians describe the period from about 800 B.C.E. to 200 B.C.E. as the “Axial Age,” by which they mean that this was a pivotal period of intellectual and spiritual transformation.

Hellenistic Society, 323–30 B.C.E.

How did Alexander the Great's conquests shape society in the Hellenistic period?

The Greek city-states wore themselves out fighting one another, and Philip II, the ruler of Macedonia, a kingdom in the north of Greece, gradually conquered one after another and took over their lands. He then turned against the Persian Empire but was killed by an assassin. His son Alexander continued the fight. Alexander conquered the entire Persian Empire from Libya in the west to Bactria in the east (see Map 5.3). He also founded new cities in which Greek and local populations mixed, although he died while planning his next campaign. Alexander left behind an empire that quickly broke into smaller kingdoms, but more important, his death in 323 B.C.E. ushered in an era, the **Hellenistic**, in which Greek culture, the Greek language, and Greek thought spread as far as India, blending with local traditions.

Hellenistic Literally means "like the Greek"; describes the period from the death of Alexander the Great in 323 B.C.E. to the Roman conquest of Egypt in 30 B.C.E., when Greek culture spread.

From Polis to Monarchy, 404–200 B.C.E.

Immediately after the Peloponnesian War, Sparta began striving for empire over all the Greeks but could not maintain its hold. In 371 B.C.E. an army from the polis of Thebes destroyed the Spartan army, but the Thebans were unable to bring peace to Greece. Philip II (r. 359–336 B.C.E.), ruler of the kingdom of Macedonia on the northern border of Greece, turned the situation to his advantage. By clever use of his wealth and superb army, Philip won control of the northern Aegean, and in 338 B.C.E. he defeated a combined Theban-Athenian army, conquering Greece.

After his victory, Philip united the Greek states with his Macedonian kingdom and got the states to cooperate in a crusade to liberate the Ionian Greeks from Persian rule. Before he could launch his crusade, Philip fell to an assassin's dagger in 336 B.C.E. His son Alexander vowed to carry on Philip's mission and led an army of Macedonians and Greeks into western Asia. He won major battles against the Persians and seized Egypt from them without a fight. He ordered the building of a new city where the Nile meets the Mediterranean, a city that would soon be called Alexandria and that within a century would grow into an enormous city, rivaling Chang-an in China and Pataliputra in the Mauryan Empire of India.

By 330 B.C.E. the Persian Empire had fallen, but Alexander had no intention of stopping, and he set out to conquer much of the rest of Asia. After four years of fighting his soldiers crossed the Indus River (in the area that is now Pakistan), and finally, at the Hyphasis River, the troops refused to go farther. Alexander was enraged by the mutiny, but the army stood firm. Still eager to explore the limits of the world, Alexander turned south to the Arabian Sea and then back west (Map 5.3).

Mapping the Past

MAP 5.3 Alexander's Conquests, 336–324 B.C.E. Alexander's campaign of conquest was extensive and speedy. More important than the great success of his military campaigns was his founding of Hellenistic cities.

ANALYZING THE MAP Where are most of the cities founded by Alexander located in relation to Greece? What does this suggest about his aims?

CONNECTIONS Compare this map with Map 5.2, which shows Greek colonization in the Hellenic period. What are the major differences between the two processes of expansion?

Alexander died in Babylon in 323 B.C.E. from fever, wounds, and excessive drinking. In just thirteen years he had created an empire that stretched from his homeland of Macedonia to India, gaining the title "the Great" along the way. His campaign swept away the Persian Empire, and in its place he established a Macedonian monarchy, although this fell apart with his death. Several of the chief Macedonian generals aspired to become sole ruler, which led to civil wars that lasted for decades and tore Alexander’s empire apart. By the end of these conflicts in about 300 B.C.E., the most successful generals had carved out their own smaller monarchies, although these monarchies continued to be threatened by internal splits and external attacks.

Ptolemy (TAH-luh-mee) seized Egypt, and his descendants, the Ptolemies, ruled Egypt for nearly three hundred years, until the death of the last Ptolemaic ruler, Cleopatra VII, in 30 B.C.E. Antigonus and his descendants, the Antigonids (an-TIH-guh-nuhds), gained control of the Macedonian kingdom in Europe, which they held until they were overthrown by the Romans in 168 B.C.E. (see “Roman Expansion and Its Repercussions” in Chapter 6). Seleucus won the bulk of Alexander’s empire; his monarchy initially extended from western Asia to India, although it gradually broke into smaller states. In terms of political stability and peace, these monarchies were no improvement on the Greek polis.

The Hellenistic World, ca. 263 B.C.E.

To encourage obedience, Hellenistic kings often created ruler cults that linked the king’s authority with that of the gods, or they adopted ruler cults that already existed. This created a symbol of unity within kingdoms ruling different peoples who at first had little in common. Kings sometimes gave the cities in their territory all the external trappings of a polis, such as a council or an assembly of citizens, but these had no power. The city was not autonomous, as the polis had been, but had to follow royal orders. Hellenistic rulers generally relied on paid professionals to staff their bureaucracies and on trained, paid, full-time soldiers rather than citizen hoplites to fight their wars.

Building a Hellenized Society

Alexander's most important legacy was the spread of Greek ideas and traditions across a wide area, a process scholars later called **Hellenization**. To maintain contact with the Greek world as he moved farther eastward, Alexander founded new cities and military colonies and settled Greek and Macedonian troops and veterans in them. This practice continued after his death. These cities and colonies became powerful instruments in the spread of Hellenism and in the blending of Greek and other cultures. Wherever it was established, the Hellenistic city resembled a modern city. It was a cultural center with theaters, temples, and libraries — a seat of learning and a place for amusement. The Hellenistic city was also an economic center — a marketplace and a scene of trade and manufacturing.

Hellenization The spread of Greek ideas, culture, and traditions to non-Greek groups across a wide area.

The ruling dynasties of the Hellenistic world were Macedonian in origin, and Greeks and Macedonians initially filled all important political, military, and diplomatic positions. The prevailing institutions and laws were Greek, and Greek became the common spoken language of the entire eastern Mediterranean. Everyone who wanted to find an official position or compete in business had to learn it. Those who did gained an avenue of social mobility, and as early as the third century B.C.E. local people in some Greek cities began to rise in power and prominence. Cultural influences in the other direction occurred less frequently because they brought fewer advantages. Few Greeks learned a non-Greek language unless they were required to because of their official position. Greeks did begin to worship local deities, but often these were somewhat Hellenized and their qualities blended with those of an existing Greek god or goddess.

Metal Plate from Ay Khanoum This spectacular metal plate, made in the Bactrian city of Ay Khanoum on the Oxus River in the second century B.C.E., probably depicts the goddess Cybele being pulled in a chariot by lions with the sun-god above. Worship of Cybele, an earth-mother goddess, spread into Greece from the east, and was then spread by her Greek followers as they traveled and migrated.

In the booming city of Alexandria, the Ptolemies generally promoted Greek culture over that of the local Egyptians. This favoritism eventually led to civil unrest, but it also led the Ptolemies to support anything that enhanced Greek learning or traditions. Ptolemaic kings established what became the largest library in the ancient world. Alexandria was also home to the largest Jewish community in the ancient world, and here Jewish scholars translated the Hebrew Bible into Greek for the first time.

The kings of Bactria and Parthia (see the map “The Hellenistic World”) spread Greek culture far to the east, and their kingdoms became outposts of Hellenism. Some Bactrian and Parthian rulers converted to Buddhism, and the Buddhist ruler of the Mauryan Empire in northern India, Ashoka, may have ordered translations of his laws into Greek for the Greek-speaking residents of Bactria and Parthia. In the second century B.C.E., after the collapse of the Mauryan Empire, Bactrian armies conquered part of northern India, establishing several small Indo-Greek states where the mixing of religious and artistic traditions was particularly pronounced (see “Western Contact and the Mauryan Unification of North

India” in Chapter 3).

Yet the spread of Greek culture was wider than it was deep, as it generally did not extend far beyond the reaches of the cities. Many urban residents adopted the aspects of Hellenism that they found useful, but people in the countryside generally did not embrace it, nor were they encouraged to.

The Growth of Trade and Commerce

Not only did Alexander’s conquests change the political face of the ancient world, but the spread of Greeks eastward also created new markets, causing trade to flourish. The economic connections of the Hellenistic world later proved valuable to the Romans, allowing them to trade products and ideas more easily over a broad area.

Amphora with Alexander and Darius at the Battle of Issus Alexander, riding bareback, charges King Darius III, who is standing in a chariot. This jug was made within a decade after the battle, in a Greek colony in southern Italy, beyond the area of Alexander’s conquests, a good indication of how quickly Alexander’s fame spread.

Alexander used the wealth of the Persian Empire to finance the building of roads, the development of harbors, and especially, as noted earlier, the founding of new cities. These cities opened whole new markets to merchants. Whenever possible, merchants sent their goods by water, but overland trade also became more prominent in the Hellenistic era. This period also saw the development of standardized business customs, so that merchants of different nationalities communicated in a way understandable to them all. Trade was further facilitated by the coining of money, which provided merchants with a standard way to value goods as well as a convenient method of payment.

The increased volume of trade helped create prosperity that made luxury goods affordable to more people. As a result, overland traders brought easily transportable luxuries such as gold, silver, and precious stones to market. They extended their networks into China, from which the most prominent good in terms of volume was silk. The trade in silk later gave the major east-west route its name: the Great Silk Road. In return the peoples of the eastern Mediterranean sent east manufactured or extracted goods, especially metal weapons, cloth, wine, and olive oil. (For more on the Silk Road in East Asia, see "Inner Asia and the Silk Road" in Chapter 7.)

More economically important than trade in exotic goods were commercial dealings in essential commodities like raw materials and grain and industrial products such as pottery. Most trade in bulk commodities like grain and wood was seaborne.

For the cities of Greece and the Aegean, the trade in grain was essential because many of them could not grow enough in their mountainous terrain. Fortunately for them, abundant wheat supplies were available nearby in Egypt and in the area north of the Black Sea. The Greek cities often paid for their grain by exporting olive oil, wine, honey, dried fruit, nuts, and vegetables. Another significant commodity supplied by the Greeks was fish, which for export was salted, pickled, or dried.

Slaves were a staple of Hellenistic trade, traveling in all directions on both land and sea routes. War provided prisoners for the slave market; to a lesser extent, so did kidnapping and capture by pirates, although the origin of most slaves is unknown. Both old Greek states and new Hellenistic kingdoms were ready slave markets, and throughout the Mediterranean world slaves were almost always in demand for work in shops, fields, farms, mines, and the homes of wealthier people.

Despite the increase in trade, the Hellenistic period did not see widespread improvements in the way most people lived and worked. Cities flourished, but many people who lived in rural areas were actually worse off than they had been before, because of higher levels of rents and taxes. Technology was applied to military needs, but not to the production of food or other goods. Manual labor, not machinery, continued to turn out the agricultural produce, raw materials, and manufactured goods the Hellenistic world used.

Hellenistic Religion, Philosophy, and Science

How did religion, philosophy, and science develop in the Hellenistic world?

The mixing of peoples in the Hellenistic era influenced religion, philosophy, and science. The Hellenistic kings built temples to the old Olympian gods and promoted rituals and ceremonies like those in earlier Greek cities, but new deities also gained prominence. More people turned to mystery religions that blended Greek and non-Greek elements. Others turned to practical philosophies that provided advice on how to live a good life. In the scholarly realm, Hellenistic thinkers made advances in mathematics, astronomy, and mechanical design. Additionally, physicians used observation and dissection to better understand the way the human body works.

Religion in the Hellenistic World

When Hellenistic kings founded cities, they also built temples for the old Olympian gods. In this way they spread Greek religious beliefs throughout the Hellenistic world. Greeks and non-Greeks in the Hellenistic world also honored and worshipped deities that had not been important in the Hellenic period or that were a blend of imported Greek and indigenous gods and goddesses. Tyche (TIGH-kee), for example, was a new deity, the goddess and personification of luck, fate, chance, and fortune. Many people also believed that magic rituals and spells that invoked Tyche along with other Greek and non-Greek deities were effective, and they sought the assistance of individuals reputed to have special knowledge or powers in convincing supernatural forces to help them or to leave them alone. (See “Global Viewpoints: Hellenistic and Chinese Spells,” page 132.)

Increasingly, many people were attracted to mystery religions, which in the Hellenic period had been linked to specific gods in particular places, which meant that people who wished to become members had to travel. But new mystery religions, like Hellenistic culture in general, were not tied to a particular place; instead they were spread throughout the Hellenistic world, and temples of the new deities sprang up wherever Greeks lived.

Mystery religions incorporated aspects of both Greek and non-Greek religions and claimed to save their adherents from the worst that fate could do. Most taught that by the rites of initiation, in which the secrets of the religion were shared, devotees became united with a deity who had also died and risen from the dead. The sacrifice of the god and his victory over death saved the devotee from eternal death. Similarly, mystery religions demanded a period of preparation in which the converts strove to become pure and holy, that is, to live by the religion’s precepts. Once aspirants had prepared themselves, they went through the initiation, usually a ritual of great emotional intensity symbolizing the entry into a new life.

Isis and Horus In this small statue from Egypt, the goddess Isis is shown suckling her son, Horus. Worship of Isis spread throughout the Hellenistic world; her followers believed that Isis offered them life after death, just as she had brought Horus’s father, Osiris, back to life.

Among the mystery religions, the Egyptian cult of Isis took the Hellenistic world by storm. In Egyptian mythology Isis brought her husband, Osiris, back to life (see “The Nile and the God-King” in Chapter 2), and during the Hellenistic era this power came to be understood by her followers as extending to them as well. She promised to save any mortal who came to her, and her priests asserted that she had bestowed on humanity the gift of civilization and founded law and literature. Isis was understood to be a devoted mother as well as a devoted wife, and she became the goddess of marriage, conception, and childbirth. She became the most important goddess of the Hellenistic world. Devotion to Isis, and to many other mystery religions, spread to the Romans as well as the Greeks when the two civilizations came into greater contact.

GLOBAL VIEWPOINTS

Hellenistic and Chinese Spells

Throughout the ancient world, people carried out rituals and ceremonies to attract good spirits and drive away bad ones, and in many places they also sought to use the spirits and gods to accomplish tasks for them. Most of these rituals were oral, but sometimes they were written down. The first text is from a Hellenistic spell inscribed on a lead tablet and is directed toward Anubis, the dog-headed Egyptian god of the underworld; by means of this spell, a woman named Sophia seeks to attract a woman named Gorgonia. With the religious mixing common in the Hellenistic world, the text mentions a number of Egyptian and Greek deities of the underworld and was most likely written by a professional spell caster. The second text is from a third-century-B.C.E. Chinese manuscript written on bamboo slips (for an example of these, see “Analyzing the Evidence: Inscribed Bamboo Slips” in Chapter 4) and discovered in a tomb. It provides a series of spells designed to identify demons and instruct people in how to lessen the demons’ power.

Hellenistic Spell of Attraction

■ “Fundament of the gloomy darkness, jagged-toothed dog, covered with coiling snakes, turning three heads, traveler in the recesses of the underworld, come, spirit-driver, with the Erinyes [or Furies, Greek goddesses of vengeance, often shown with snake hair and whips], savage with their stinging whips; holy serpents, maenads [frenzied female followers of Dionysus], frightful maidens, come to my wroth incantations. Before I persuade by force this one and you, render him immediately a fire-breathing daemon. Listen and do everything quickly, in no way opposing me in the performance of this action; for you are the governors of the earth.” … By means of this corpse-daemon inflame the heart, the liver [which people also saw as a location of emotions], the spirit of Gorgonia, whom Nilogenia bore, with love and affection for Sophia, whom Isara bore…. Drive Gorgonia, whom Nilogenia bore, drive her, torment her body night and day, force her to rush forth from every place and every house, loving Sophia, whom Isara bore, she, surrendered like a slave, giving herself and all her possessions to her, because this is the will and command of the great god…. “Blessed lord of the immortals, holding the scepters of Tartaros and of terrible, fearful Styx [?] and of life-robbing Lethe, the hair of Kerberos trembles in fear of you, you crack the loud whips of the Erinyes; the couch of Persephone delights you, when you go to the longed bed, whether you be the immortal Sarapis, whom the universe fears, whether you be Osiris, star of the land of Egypt; your messenger is the all-wise boy; yours is Anubis, the pious herald of the dead. Come hither, fulfill my wishes, because I summon you by these secret symbols."

Chinese Spells to Repel Demons

■ Spellbinding to inflict odium on demons. The Wang-hang [demons who live underground] who injure people treat people unpropitiously. Let the way for how to spellbind them be declared, to enable the people to not encounter the baleful and calamitous. What demons detest are namely reclining in a crouch, sitting like a winnowing basket, interlinked motion [with the legs apart and extended], and the leaning stand [all postures thought to make the body resistant to demons]….

The dwelling places of the great spirits cannot be passed through. They like to injure people. Make pellets from dog excrement and carry them when passing through. Throw them at the spirit when it appears, and it will not injure people….

If human or birds or beasts as well as the six domestic animals constantly roam through a person's domicile, these are spirits from above who like to descend and take pleasure in entering. Have boys and girls who have never entered the domicile beat drums, ring bells with clappers, and screech at them, and they will not come.

QUESTIONS FOR ANALYSIS

1. In the Hellenistic spell, what feelings does Sophia direct Anubis and the other spirits to create in Gorgonia, and what behavior is the expected result of these feelings?
2. In the Chinese spell, what actions are people to take to drive away demons?
3. Belief in the power of spirits is sometimes viewed as making people feel helpless and fatalistic. Do these sources provide evidence of this? Why or why not?

Philosophy and Its Guidance for Life

While some people turned to mystery religions to overcome Tyche and provide something permanent in a world that seemed unstable, others turned to philosophy. Several new schools of philosophical thought emerged in the Hellenistic period. One of these was **Epicureanism**, a practical philosophy of serenity in an often-tumultuous world. Epicurus (340–270 B.C.E.) decided that the principal goods of human life were contentment and pleasure, which he defined as the absence of pain, fear, and suffering. By encouraging the pursuit of pleasure, he was not advocating drunken revels or sexual excess, which he thought caused pain, but promoting moderation. Epicurus also taught that individuals could most easily attain peace and serenity by ignoring the outside world and looking instead into their personal feelings. His followers ignored politics because it led to tumult, which would disturb the soul.

Epicureanism A system of philosophy based on the teachings of Epicurus, who viewed a life of contentment, free from fear and suffering, as the greatest good.

Zeno (335–262 B.C.E.), a philosopher from Cyprus, advanced a different concept of human beings and the universe. Zeno first came to Athens to form his own school, the Stoa. His philosophy, **Stoicism** (STOH-uh-sih-zuhm), in turn, came to be named for his school. Zeno and his followers considered nature an expression of divine will; in their view, people could be happy only when living in accordance with nature. They stressed the unity of humans and the universe, stating that all people were obliged to help one another.

Stoicism A philosophy, based on the ideas of Zeno, that held that people could only be happy when living in accordance with nature and accepting whatever happened.

Hellenistic Married Life This small terra-cotta figurine from Myrina in what is now Turkey, made in the second century B.C.E., shows a newly married couple sitting on a bridal bed. The groom is drawing back the bride's veil, and she is exhibiting the modesty that was a desired quality in young women. Figurines representing every stage of life became popular in the Hellenistic period and were used for religious offerings in temples and sacred places. This one was found in a tomb.

The Stoics' most lasting practical achievement was the creation of the concept of natural law. They concluded that as all people were kindred, partook of divine reason, and were in harmony with the universe, one natural law governed them all.

Hellenistic Science and Medicine

Hellenistic thinkers made advances in mathematics, astronomy, and mechanical design. The most notable of the Hellenistic astronomers was Aristarchus of Samos (ca. 310–230 B.C.E.). Aristarchus rightly concluded that the sun is far larger than the earth and that the stars are enormously distant from the earth. He also argued against Aristotle's view that the earth is the center of the universe, instead propounding the heliocentric theory — that the earth and planets revolve around the sun.

In geometry Euclid (YOO-kluhd) (fl. ca. 300 B.C.E.), a mathematician living in Alexandria, compiled a valuable textbook of existing knowledge. His *Elements of Geometry* became the standard introduction to the subject.

The greatest thinker of the Hellenistic period was Archimedes (ahr-kuh-MEE-deez) (ca. 287–212 B.C.E.). A clever inventor, he devised new artillery for military purposes. In peacetime he created the water screw to draw water from a lower to a higher level. (See “Individuals in Society: Archimedes, Scientist and Inventor,” at right.) He also invented the compound pulley to lift heavy weights. His chief interest, however, lay in pure mathematics. He founded the science of hydrostatics (the study of fluids at rest) and discovered the principle that the weight of a solid floating in a liquid is equal to the weight of the liquid displaced by the solid.

Eratosthenes (ehr-uh-TOSS-thuh-neez) (285–ca. 204 B.C.E.), who was the librarian of the vast Ptolemaic royal library in Alexandria, used mathematics to further the geographical studies for which he is most famous. He concluded that the earth is a spherical globe and calculated the circumference of the earth geometrically with remarkable accuracy.

As the new artillery devised by Archimedes indicates, Hellenistic science was used for purposes of war as well as peace. Theories of mechanics were applied to build military machines. The catapult became the most widely used artillery piece. As the Assyrians had earlier, engineers built siege towers, large wooden structures that served as artillery platforms, and put them on wheels so that soldiers could roll them up to a town’s walls. Generals added battering rams to bring down large portions of walls. If these new engines made warfare more efficient, they also added to the misery of the people, as war often directly involved the populations of cities. War and illness fed the need for medical advances, and doctors as well as scientists combined observation with theory during the Hellenistic period. Herophilus, who lived in the first half of the third century B.C.E., worked in Alexandria and studied the writings attributed to Hippocrates. He approached the study of medicine in a systematic, scientific fashion: he dissected dead bodies and measured what he observed. His students carried on his work, searching for the causes and nature of illness and pain.

Medical study did not lead to effective cures for the infectious diseases that were the leading cause of death for most people, however, and people attempted to combat illness in a variety of ways. Medicines prescribed by physicians or prepared at home often included natural products blended with materials understood to work magically. People in the Hellenistic world may have thought that fate determined what would happen, but they also actively sought to make their lives longer and healthier.

INDIVIDUALS IN SOCIETY

Archimedes, Scientist and Inventor

Image by the Rochester Institute of Technology. Copyright resides with the owner of the Archimedes Palimpsest, but digital images of the entire manuscript can be found at www.archimedespalimpsest.org.

Several of Archimedes's treatises were found on a palimpsest, a manuscript that has been scraped and washed so that another text can be written over it, thus reusing the expensive parchment. Reusing parchment was a common practice in the Middle Ages, but the original text can sometimes be reconstructed. Using digital processing with several types of light and X-rays to study this thirteenth-century-C.E. prayer book, scientists were slowly able to decipher the texts by Archimedes that were underneath, including one that had been completely lost.

ARCHIMEDES WAS BORN IN THE GREEK CITY OF SYRACUSE in Sicily, an intellectual center in which he pursued scientific interests. He was the most original thinker of his time and a practical inventor. In his book *On Plane Equilibriums*, he dealt for the first time with the basic principles of mathematics, including the principle of the lever. He once said that if he were given a lever and a suitable place to stand, he could move the world. He also demonstrated how easily his compound pulley could move huge weights with little effort, as reported by the Roman biographer Plutarch:

> A three-masted merchant ship of the royal fleet had been hauled on land by

> hard work and many hands. Archimedes put aboard her many men and the usual freight. He sat far away from her; and without haste, but gently working a compound pulley with his hand, he drew her towards him smoothly and without faltering, just as though she were running on the surface.

He likewise invented the Archimedian screw, a pump to bring subterranean water up to irrigate fields, which quickly came into common use. In his treatise *On Floating Bodies,* Archimedes founded the science of hydrostatics. He concluded that an object will float if it weighs less than the water it displaces, and that whenever a solid floats in a liquid, the weight of the solid equals the weight of the liquid displaced. A story told later by the Roman architect Vitruvius recounts that Archimedes discovered this when he climbed into a public bath and noticed the water flowing out because of the bulk of his body, which enabled him to prove that a king's gold crown was really part silver. He sprang out of the tub and rushed through the streets naked, yelling in a loud voice, "Eureka, eureka" ("I have found it, I have found it").

War between Rome and Syracuse unfortunately interrupted Archimedes's scientific life. In 213 B.C.E., during the Second Punic War, the Romans besieged the city. Hiero, its king and Archimedes's friend, asked the scientist for help in repulsing Roman attacks. Archimedes began to build remarkable devices, including weapons that threw stones to break up infantry attacks. For use against Roman warships he is said to have designed a machine with beams from which large claws dropped onto the hulls of enemy warships, hoisted them into the air, and dropped them back into the sea. Later Greek authors reported that he destroyed Roman ships with a series of polished mirrors that focused sunlight and caused the ships to catch fire. Modern experiments re-creating Archimedes's weapons have found that the claw may have been workable, but the mirrors probably were not, as they required a ship to remain stationary for the fire to ignite. It is not certain whether his war machines were actually effective, but later people recounted tales that the Romans became so fearful that whenever they saw a bit of rope or a stick of timber projecting over one of the walls protecting Syracuse, they shouted, "There it is — Archimedes is trying some engine on us," and fled. After many months the Roman siege was successful, however, and Archimedes was killed by a Roman soldier.

QUESTIONS FOR ANALYSIS

1. How did Archimedes combine theoretical mathematics and practical issues in his work?

2. What applications do you see in the world around you of the devices Archimedes improved or invented, such as the lever, the pulley, and artillery?

Chapter Summary

Greece's mountainous terrain encouraged the development of small, independent communities and political fragmentation. Sometime after 2000 B.C.E. two kingdoms — the Minoan on Crete and the Mycenaean on the mainland — did emerge, but these remained smaller than the great empires of Mesopotamia, India, and China. The fall of these kingdoms led to a period of disruption and decline known as the Greek Dark Age (ca. 1100–800 B.C.E.). However, Greek culture survived, and Greeks developed the independent city-state, known as the polis. Greeks also established colonies and traveled and traded as far east as the Black Sea and as far west as the Atlantic Ocean. Two poleis became especially powerful: Sparta, which created a military state in which men remained in the army most of their lives, and Athens, which created a democracy in which male citizens had a direct voice. In the classical period, between 500 B.C.E. and 338 B.C.E., Greeks engaged in war with the Persians and with one another, but they also created drama, philosophy, and magnificent art and architecture.

In the middle of the fourth century B.C.E. the Greek city-states were conquered by the Macedonians under King Philip II and his son Alexander. Alexander conquered the entire Persian Empire and founded new cities in which Greek and local populations mixed. His successors continued to build cities and colonies, which were centers of trade and spread Greek culture over a broad area, extending as far east as India. The mixing of peoples in the Hellenistic era influenced religion, philosophy, and science. New deities gained prominence, and many people turned to mystery religions that blended Greek and non-Greek elements as they offered followers secret knowledge and eternal life. Others turned to practical philosophies that provided advice on how to live a good life. Advances were made in technology, mathematics, science, and medicine, but these were applied primarily to military purposes, not to improving the way ordinary people lived and worked.

CONNECTIONS

The ancient Greeks built on the achievements of earlier societies in the eastern Mediterranean, but they also added new elements, including drama, philosophy, science, and realistic art. Eventually the Greek world was largely conquered by the

Romans, as you will learn in the following chapter, and the various Hellenistic monarchies became part of the Roman Empire. In cultural terms the lines of conquest were reversed: the Romans derived their alphabet from the Greek alphabet, though they changed the letters somewhat. Roman statuary was modeled on Greek and was often, in fact, made by Greek sculptors, who found ready customers among wealthy Romans. Furthermore, the major Roman gods and goddesses were largely the same as Greek ones, though they had different names. Although the Romans did not seem to have been particularly interested in the speculative philosophy of Socrates and Plato, they were drawn to the more practical philosophies of the Epicureans and Stoics. And like the Hellenistic Greeks, many Romans turned to mystery religions that offered secret knowledge and promised eternal life.

The influence of the ancient Greeks was not limited to the Romans, of course. The cities and military colonies founded in the wake of Alexander’s conquests spread Greek ideas and culture around the entire eastern Mediterranean and eastward to Central and South Asia — today’s Afghanistan, Pakistan, and Tajikistan. As discussed in Chapter 3, art and thought in northern India were shaped by the blending of Greek and Buddhist traditions. And as you will see in Chapter 15, European thinkers and writers made conscious attempts to return to classical ideals in art, literature, and philosophy during the Renaissance. In the United States political leaders from the Revolutionary era on decided that important government buildings should be modeled on the Parthenon or other temples. In some ways, capitol buildings in the United States are good symbols of the legacy of Greece — gleaming ideals of harmony, freedom, democracy, and beauty that (as with all ideals) do not always correspond with realities.

Review the Main Ideas

Answer the focus questions from each section of the chapter.

1. How did the geography of Greece shape its earliest history? (p. 114)
2. What was the role of the polis in Greek society? (p. 116)
3. In the classical period, how did war influence Greece, and how did the arts, religion, and philosophy develop? (p. 120)
4. How did Alexander the Great's conquests shape society in the Hellenistic period? (p. 127)
5. How did religion, philosophy, and science develop in the Hellenistic world? (p. 131)

Make Comparisons and Connections

Analyze the larger developments and continuities within and across chapters.

1. Philosophers and religious thinkers in ancient India, China, and Greece, such as Mahavira and the Buddha (Chapter 3), Confucius and Zhuangzi (Chapter 4), and Socrates and Zeno (this chapter), all developed ideas about the ultimate aim of human life. What similarities and differences do you see among them?
2. The Persian Empire (Chapter 2) first brought India and the Mediterranean in contact with one another, and these contacts increased with the conquests of Alexander (Chapter 3 and this chapter). What were the major results of these contacts in terms of politics, culture, and economics?

3. Cities had existed in the areas conquered by Alexander long before his conquests. What would the residents of Sumer or Babylon (Chapter 2), the early cities of the Indus River Valley (Chapter 3), and a Hellenistic city find unusual about one another's cities? What would seem familiar?
4. Looking at your own town or city, what evidence do you find of the cultural legacy of ancient Greece?

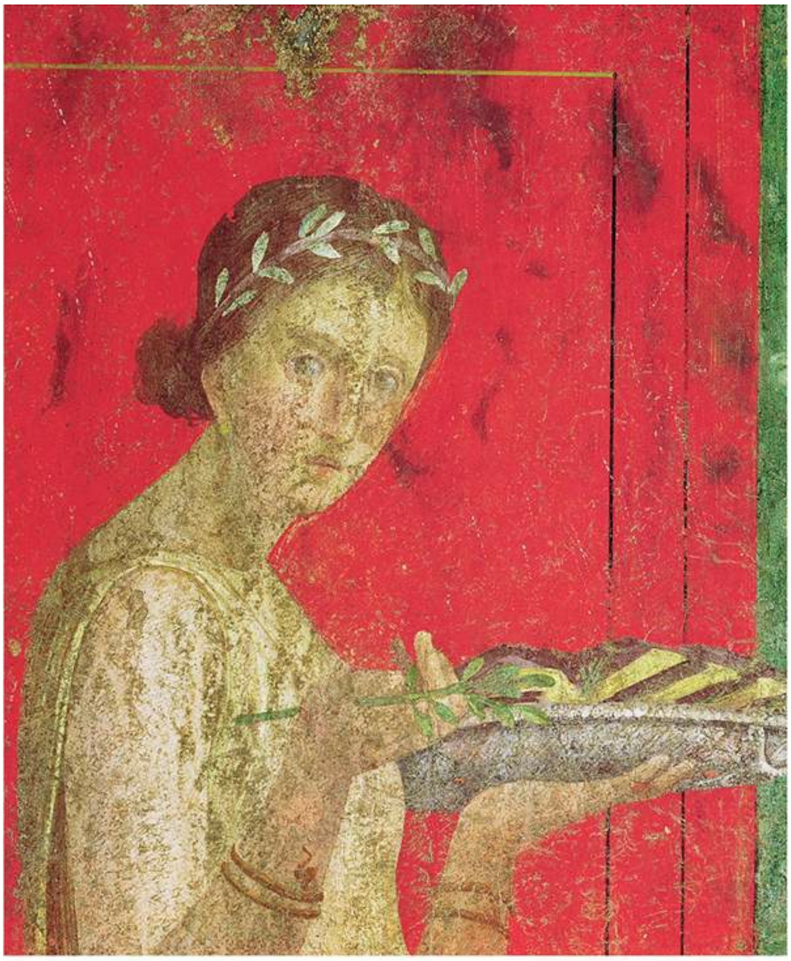
The World of Rome

ca. 1000 B.C.E.–400 C.E.



Detail of the Initiate, from the Catechism Scene, North Wall, fresco/Villa dei Misteri, Pompeii, Italy/Bridgeman Images

Woman from Pompeii

This brightly painted fresco from a villa in Pompeii shows a young woman carrying a tray in a religious ritual. Pompeii was completely buried in ash in a volcanic explosion in 79 C.E., and excavations have revealed life in what was a vacation spot for wealthy Romans.

Like the Persians under Cyrus, the Mauryans under Chandragupta, and the Macedonians under Alexander, the Romans conquered vast territories. With a republican government under the leadership of the Senate, a political assembly whose members were primarily wealthy landowners, the Romans conquered all of Italy, then the western Mediterranean basin, and then areas in the East that had been part of Alexander the Great's empire. As they did, they learned about and incorporated Greek art, literature, philosophy, and religion, but the wars of conquest also led to serious problems that the Senate proved unable to handle. After a grim period of civil war that ended in 31 B.C.E., the emperor Augustus restored peace and expanded Roman power and law as far east as the Euphrates River, creating the institution that the modern world calls the "Roman Empire." Later emperors extended Roman authority farther still, so that at its largest the Roman Empire stretched from England to Egypt and from Portugal to Persia.

Roman history is generally divided into three periods: the monarchical period, traditionally dated from 753 B.C.E. to 509 B.C.E., in which the city of Rome was ruled by kings; the republic, traditionally dated from 509 B.C.E. to 27 B.C.E., in which it was ruled by the Senate; and the empire, from 27 B.C.E. to 476 C.E., in which Roman territories were ruled by an emperor.

The Romans in Italy

How did the Romans come to dominate Italy, and what political institutions did they create?

The colonies established by Greek poleis (city-states) in the Hellenic era included a number along the coast of southern Italy and Sicily. So many Greek settlers came to this area that it later became known as Magna Graecia — Greater Greece. These Greek colonies transmitted much of their culture to people who lived farther north in the Italian peninsula. These included the Etruscans (ih-TRUHS-kuhns), who built the first cities north of Magna Graecia, and then the Romans, who eventually came to dominate the peninsula. In addition to allying with conquered peoples and granting them citizenship, the Romans established a republic ruled by a Senate. However, social conflicts over the rights to power eventually erupted and had to be resolved.

The Etruscans

The culture that is now called Etruscan developed in north-central Italy about 800 B.C.E. The Etruscans most likely originated in Turkey or elsewhere in southwest Asia, although when they migrated to Italy is not clear. The Etruscans spoke a language that was very different from Greek and Latin, but they adopted the Greek alphabet to write their language.

The Etruscans, ca. 500 B.C.E.

The Etruscans established permanent settlements that evolved into cities resembling the Greek city-states (see “Organization of the Polis” in Chapter 5) and thereby built a rich cultural life, full of art and music, that became the foundation of civilization in much of Italy. They spread their influence over the surrounding countryside, which they farmed and mined for its rich mineral resources. From an early period the Etruscans began to trade natural products, especially iron, with their Greek neighbors to the south and with other peoples throughout the Mediterranean in exchange for luxury goods. Etruscan cities appear to have been organized in leagues, and beginning about 750 B.C.E. the Etruscans expanded southward into central Italy through military actions and through the establishment of colony cities. In the process they encountered a small collection of villages subsequently called Rome.

The Founding of Rome

Archaeological evidence indicates that the ancestors of the Romans began to settle on the hills east of the Tiber during the early Iron Age, around 1000 B.C.E. to 800 B.C.E. Later Romans told a number of stories about the founding of Rome. These mix legend and history, but they illustrate the traditional ethics, morals, and ideals of Rome.

According to legend, Romulus and Remus founded the city of Rome, an event later Roman authors dated precisely to 753 B.C.E. These twin brothers were the sons of the war god Mars, and their mother, Rhea Silvia, was a descendant of Aeneas, a brave and pious Trojan who left Troy after it was destroyed by the Greeks in the Trojan War. The brothers, who were left to die by a jealous uncle, were raised by a female wolf. When they were grown they decided to build a city, but quarreled over its location; Romulus killed Remus and named the city after himself. He also established a council of advisers later called the Senate. He and his mostly male followers expanded their power over neighboring peoples, in part by abducting and marrying their women. The women then arranged a peace by throwing themselves between their brothers and their husbands, convincing them that killing kin would make the men cursed. The Romans, favored by the gods, continued their rise to power. This founding myth ascribes positive traits to the Romans: they are descended from gods and heroes, can thrive in wild and tough settings, will defend their boundaries at all costs, and mix with other peoples rather than simply conquering them. Also, the story portrays women who were ancestors of Rome as virtuous and brave.

Later Roman historians continued the story by describing a series of kings after Romulus, each elected by the Senate. According to tradition, the last three kings were Etruscan, and another tale about female virtue was told to explain why the Etruscan kings were overthrown. In this story, the son of King Tarquin, the Etruscan king who ruled Rome, raped Lucretia, a virtuous Roman wife, in her own home. She demanded that her husband and father seek vengeance and then committed suicide in front of them. Her father and husband and the other Roman nobles swore to avenge Lucretia's death by throwing out the Etruscan kings, and they did. The Romans generally accepted this story as historical fact and dated the expulsion of the Etruscan kings to 509 B.C.E. They thus saw this year as marking the end of the monarchical period and the dawn of the republic, which had come about because of a wronged woman and her demands.

Most historians today view the idea that Etruscan kings ruled the city of Rome as legendary, but they stress the influence of the Etruscans on Rome. The Etruscans transformed Rome into a real city with walls, temples, a drainage system, and other urban structures. The Romans adopted the Etruscan alphabet, which the Etruscans themselves had adopted from the Greeks. Even the toga came from the Etruscans, as did gladiatorial combat honoring the dead. In engineering and architecture the Romans adopted some design elements and the basic plan of their temples, along with paved roads, from the Etruscans.

In this early period the city of Rome does appear to have been ruled by kings. A hereditary aristocracy advised the kings and may have played a role in choosing them. And sometime in the sixth century B.C.E. a group of aristocrats revolted against these kings and established a government in which the main institution of power would be the **Senate**, an assembly of aristocrats, rather than a single monarch. Executive power was in the hands of leaders called **consuls**, who commanded the army in battle, administered state business, and supervised financial affairs, but there were always two of them and they were elected for one-year terms only, not for life. Rome thereby became a republic, not a monarchy. Thus at the core of the myths is a bit of history.

consuls Primary executives in the Roman Republic, elected for one-year terms, who commanded the army in battle, administered state business, and supervised financial affairs.

The Roman Conquest of Italy

In the years following the establishment of the republic, the Romans fought numerous wars with their neighbors on the Italian peninsula. The Roman army was made up primarily of citizens of Rome, who were organized for military campaigns into legions. War also involved diplomacy, at which the Romans became masters.

In 387 B.C.E. the Romans suffered a major setback when the Celts — or Gauls, as the Romans called them — invaded the Italian peninsula from the north and sacked the city of Rome. The Celts agreed to abandon Rome in return for a thousand pounds of gold. In the century that followed, the Romans rebuilt their city and recouped their losses. They brought Latium and their Latin allies fully under their control and conquered Etruria. In a series of bitter wars the Romans also subdued southern Italy and then turned north. Their superior military institutions, organization, and manpower allowed them to conquer or bring under their influence most of Italy by about 265 B.C.E. (Map 6.1).

MAP 6.1 **Roman Italy and the City of Rome, ca. 218 B.C.E.** As Rome expanded, it built roads linking major cities and offered various degrees of citizenship to the territories it conquered or with which it made alliances. The territories outlined in green that are separate from the Italian peninsula were added by 218 B.C.E., largely as a result of the Punic Wars.

As they expanded their territory, the Romans spread their religious traditions throughout Italy, blending them with local beliefs and practices. Religion for the Romans was largely a matter of honoring one's own ancestors and kin, and showing loyalty to the state. The main goal of religion was to secure the peace of the gods and to harness divine power for public and private enterprises. Religious rituals were an important way of expressing common civic values, which for Romans meant those evident in their foundation myths: bravery, morality, seriousness, family, and home. Victorious generals made sure to honor the gods of people they had conquered and by doing so transformed them into gods they could also call on for assistance in their future campaigns. As the Romans conquered the cities of Magna Graecia, the Greek deities were absorbed into the Roman pantheon.

Once they had conquered an area, the Romans did what the Persians had earlier done to help cement their new territory: they built roads. Roman roads facilitated the flow of communication, trade, and armies from the capital to outlying areas.

In politics the Romans shared full Roman citizenship with many of their oldest allies, particularly the inhabitants of the cities of Latium. In other instances they granted citizenship without the franchise, that is, without the right to vote or hold Roman office. These allies were subject to Roman taxes and calls for military service but ran their own local affairs.

The Roman State

Along with citizenship, the republican government was another important institution of Roman political life. The Romans summed up their political existence in a single phrase: *senatus populusque Romanus*, “the Senate and the Roman people,” which they abbreviated “SPQR.” This phrase stands for the beliefs, customs, and laws of the republic — its unwritten constitution that evolved over two centuries to meet the demands of the governed.

Coin Showing a Voter This coin from 63 B.C.E. shows a citizen dropping a tablet into a voting urn, the Roman equivalent of today’s ballot box. The *V* on the tablet means a yes vote, and an inscription on the coin identifies the moneyer, the official who controlled coin production and decided what would be shown on the coins. This moneyer, Lucius Cassius Longinus, depicted a vote held fifty years earlier about whether an ancestor of his should be named prosecutor in a trial charging three vestal virgins with unchastity. As was common among moneyers, Longinus chose this image as a way to advance his political career, in this case by suggesting his family’s long history of public office.

In the early republic, social divisions determined the shape of politics. Political power was in the hands of a hereditary aristocracy — the **patricians**, whose privileged legal status was determined by their birth as members of certain families. The common people of Rome, the **plebeians** (plih-BEE-uhns), were free citizens with a voice in politics, but they had few of the patricians’ political and social advantages. While some plebeian merchants rivaled the patricians in wealth, most plebeians were poor artisans, small farmers, and landless urban dwellers.

patricians The Roman hereditary aristocracy, who held most of the political power in the republic.

plebeians The common people of Rome, who were free but had few of the patricians’ advantages.

The Romans created several assemblies through which men elected high officials and passed ordinances. The most important of these was the Senate. During the republic, the Senate advised the consuls and other officials about military and political matters and handled government finances. Because the Senate sat year after year with the same members, while the consuls changed annually, it provided stability, and its advice came to have the force of law. Another responsibility of the Senate was to handle relations between Rome and other powers.

The highest officials of the republic were the two consuls, positions initially open only to patrician men. The consuls commanded the army in battle, administered state business, and supervised financial affairs. When the consuls were away from Rome, praetors (PREE-tuhrz) could act in their place. After the age of overseas conquests (see “Roman Expansion and Its Repercussions”), the Romans divided their lands in the Mediterranean into provinces governed by ex-consuls and ex-praetors.

A lasting achievement of the Romans was their development of law. Roman civil law, the *ius civile,* consisted of statutes, customs, and forms of procedure that regulated the lives of citizens. As the Romans came into more frequent contact with foreigners, the praetors applied a broader *ius gentium,* the “law of the peoples,” to such matters as peace treaties, the treatment of prisoners of war, and the exchange of diplomats. In the ius gentium, all sides were to be treated the same regardless of their nationality. By the late republic, Roman jurists had widened this still further into the concept of *ius naturale*, “natural law” based in part on Stoic beliefs (see “Philosophy and Its Guidance for Life” in Chapter 5). Natural law, according to these thinkers, is made up of rules that govern human behavior that come from applying reason rather than customs or traditions, and so apply to all societies. In reality, Roman officials generally interpreted the law to the advantage of Rome, of course, at least to the extent that the strength of Roman armies allowed them to enforce it. But Roman law came to be seen as one of Rome’s most important legacies.

Social Conflict in Rome

Inequality between plebeians and patricians led to a conflict known as the Struggle of the Orders. In this conflict the plebeians sought to increase their power by taking advantage of the fact that Rome’s survival depended on its army, which needed plebeians to fill the ranks of the infantry. According to tradition, in 494 B.C.E. the plebeians literally walked out of Rome and refused to serve in the army. Their general strike worked, and the patricians made important concessions. They allowed the plebeians to elect their own officials, the tribunes, who could bring plebeian grievances to the Senate for resolution and could also veto the decisions of the consuls. Thus, as in Archaic age Greece (see “The Development of the Polis in the Archaic Age” in Chapter 5), political rights were broadened because of military needs for foot soldiers.

The law itself was the plebeians’ primary target. Only the patricians knew what the law was, and only they could argue cases in court. All too often they used the law for their own benefit. The plebeians wanted the law codified and published. After much struggle, in 449 B.C.E. the patricians surrendered their legal monopoly and codified and published the

Laws of the Twelve Tables. The patricians also made legal procedures public so that plebeians could argue cases in court. Several years later the patricians passed a law that for the first time allowed patricians and plebeians to marry one another.

After a ten-year battle, the Licinian-Sextian laws passed in 367 B.C.E. gave wealthy plebeians access to all the offices of Rome, including the right to hold one of the two consulships. Once plebeians could hold the consulship, they could also sit in the Senate and advise on policy. Though decisive, this victory did not automatically end the Struggle of the Orders. That happened only in 287 B.C.E. with the passage of the *lex Hortensia*, which gave the resolutions of the *concilium plebis*, the plebeian assembly, the force of law for patricians and plebeians alike.

Roman Expansion and Its Repercussions

How did Rome expand its power beyond Italy, and what were the effects of this expansion?

As the republican government was developing, Roman territory continued to expand. The Romans conquered lands all around the Mediterranean, bringing them unheard-of power and wealth. As a result, many Romans became more cosmopolitan and comfortable, and they were especially influenced by the culture of one conquered land: Greece. Yet social unrest also came in the wake of the wars, opening unprecedented opportunities for ambitious generals who wanted to rule Rome like an empire. A series of civil wars ensued, wars that republican government did not survive.

Overseas Conquests and the Punic Wars, 264 –133 B.C.E.

The Romans did not map out grandiose strategies to conquer the world. Rather they responded to situations as they arose. This meant that they sought to eliminate any state they saw as a military threat.

Their presence in southern Italy brought the Romans to the island of Sicily, where they confronted another great power in the western Mediterranean, Carthage (CAHR-thij). The city of Carthage had been founded by Phoenicians as a trading colony in the eighth century B.C.E. (see “Iron and the Emergence of New States” in Chapter 2). By the fourth century B.C.E. the Carthaginians began to expand their holdings. At the end of a long string of wars, the Carthaginians had created a mercantile empire that stretched from western Sicily to beyond Gibraltar.

The Carthaginian Empire and the Roman Republic, 264 B.C.E.

The conflicting ambitions of the Romans and Carthaginians led to the first of the three **Punic Wars**. During the course of the first war, which lasted from 264 B.C.E. to 241 B.C.E., Rome built a navy and defeated

Carthage in a series of sea battles. Sicily became Rome's first province, but despite a peace treaty, the conflict was not over.

Two Triremes Race In this fresco painting from the temple of Isis in Pompeii, two triremes — narrow warships powered by several banks of long oars — race in what was most likely a festival celebrating the goddess. Greeks, Carthaginians, and Romans all used triremes, which had bronze front pieces designed to smash into enemy ships. The one hundred to two hundred oarsmen had to row in time to achieve the necessary speed, which took long practice, so this religious celebration also served a military purpose.

Carthaginian armies moved into Spain, where Rome was also claiming territory. The brilliant Carthaginian general Hannibal (ca. 247–183 B.C.E.) marched an army of tens of thousands of troops — and, more famously, several dozen war elephants — from Spain across what is now France and over the Alps into Italy, beginning the Second Punic (PYOO-nik) War (218–201 B.C.E.). Hannibal won three major victories, including a devastating blow at Cannae in southeastern Italy in 216 B.C.E. He then spread devastation throughout Italy. Yet Hannibal was not able to win areas near Rome in central Italy.

The Roman general Scipio Africanus (ca. 236–ca. 183 B.C.E.) took Spain from the Carthaginians and then struck directly at Carthage itself, prompting the Carthaginians to recall Hannibal from Italy to defend the homeland. In 202 B.C.E., near the town of Zama, Scipio defeated Hannibal in one of the world's truly decisive battles. Scipio's victory meant that the world of the western Mediterranean would henceforth be Roman. Roman language, law, and culture, fertilized by Greek influences, would in time permeate this entire region.

The Second Punic War contained the seeds of still other wars. Unabated fear of Carthage led to the Third Punic War (149–146 B.C.E.), a needless, unjust, and savage conflict that ended with obliteration of the city of Carthage itself.

After the Second Punic War, the Romans turned east. Roman victory in Macedonia turned Antigonid Macedonia into a Roman province. Then they moved farther east and defeated the Seleucid monarchy. In 133 B.C.E. the king of Pergamum in Asia Minor willed his kingdom to Rome when he died. The Ptolemies of Egypt retained formal control of their kingdom, but they obeyed Roman wishes in terms of trade policy. Declaring the Mediterranean *mare nostrum*, "our sea," the Romans began to create a political and administrative machinery to hold the Mediterranean together under a system of provinces ruled by governors sent from Rome.

New Influences and Old Values in Roman Culture

With the conquest of the Mediterranean world, Rome became a great city. The spoils of war went to build theaters, stadiums, and other places of amusement, and Romans and Italian townspeople began to spend more of their time in leisure pursuits. This new urban culture reflected Hellenistic influences. Romans developed a liking for Greek literature and art, and it became common for an educated Roman to speak both Latin and Greek. Furthermore, the Roman conquest of the Hellenistic East resulted in wholesale confiscation of Greek paintings and sculpture to grace Roman temples, public buildings, and private homes.

The Greek custom of bathing also gained popularity in the Roman world. Increasingly, Romans built large public buildings containing pools supplied by intricate systems of aqueducts. These structures were more than just places to bathe. Baths included gymnasia where men exercised, snack bars and halls where people chatted and read, and even libraries and lecture halls. Women had opportunities to bathe, generally in separate facilities or at separate times, and both women and men went to the baths to see and be seen. Conservative commentators objected to these new pastimes as a corruption of traditional Roman values, but most Romans saw them as a normal part of urban life.

Roman Bath This Roman bath in Bath, England (a city to which it gave its name), was built around a natural hot spring beginning in the first century C.E. The Romans spread the custom of bathing, which they had adopted from the Greeks, to the outer reaches of their empire. In addition to hot water, bathers used oil for massage and metal scrapers to clean and exfoliate their skin. Many Roman artifacts have been unearthed at Bath, including a number of curse tablets, small tablets made of lead calling on the gods to harm someone, which were common in the Greco-Roman world. Not surprisingly, many of the curse tablets found at Bath relate to the theft of clothing while people were bathing.

New customs did not change the core Roman social structures. The male head of the household was called the **paterfamilias**, and he had great power over his children. Fathers had the power to decide how family resources should be spent, and sons did not inherit until after their fathers had died. Women could inherit and own property, though they generally received a smaller portion of any family inheritance than their brothers did. The Romans praised women, like Lucretia of old, who were virtuous and loyal to their husbands and devoted to their children. Very young children were under their mother’s care, and most children learned the skills they needed from their own parents. For children from wealthier urban families, opportunities for formal education increased in the late republic. Boys and girls might be educated in their homes by tutors, and boys also might go to a school, paid for by their parents.

paterfamilias The oldest dominant male of the family, who held great power over the lives of family members.

An influx of slaves from Rome’s conquests provided labor for the fields, mines, and cities. To the Romans slavery was a misfortune that befell some people, but it did not entail any racial theories. For loyal slaves the Romans always held out the possibility of freedom, and manumission — the freeing of individual slaves by their masters — became common. Nonetheless, slaves rebelled from time to time in large-scale revolts, which were put down by Roman armies.

Membership in a family did not end with death, as the spirits of the family’s ancestors were understood to remain with the family. They and other gods regarded as protectors of the household were represented by small statues that were kept in a special cupboard, honored at family celebrations, and taken with the family when they moved.

The Late Republic and the Rise of Augustus, 133–27 B.C.E.

The wars of conquest eventually created serious political problems for the Romans. When the soldiers returned home, they found their farms practically in ruins. Many were forced to sell their land to ready buyers who had grown rich from the wars. These wealthy men created huge estates called latifundia. Now landless, veterans moved to the cities, especially Rome, but could not find work. These developments not only created unrest in the city but also threatened Rome’s army by reducing its ranks, because landless men, even if they were Romans and lived in Rome, were forbidden to serve in the Roman army. The landless veterans found a leader in Tiberius Gracchus (163–133 B.C.E.), an aristocrat who was appalled by the situation. He proposed dividing public land among the poor. But a group of wealthy senators murdered him, launching a long era of political violence that would destroy the republic. Still, Tiberius’s brother Gaius Gracchus (153–121 B.C.E.) passed a law providing the urban poor with cheap grain and urged practical reforms. Once again senators tried to stem the tide of reform by murdering him.

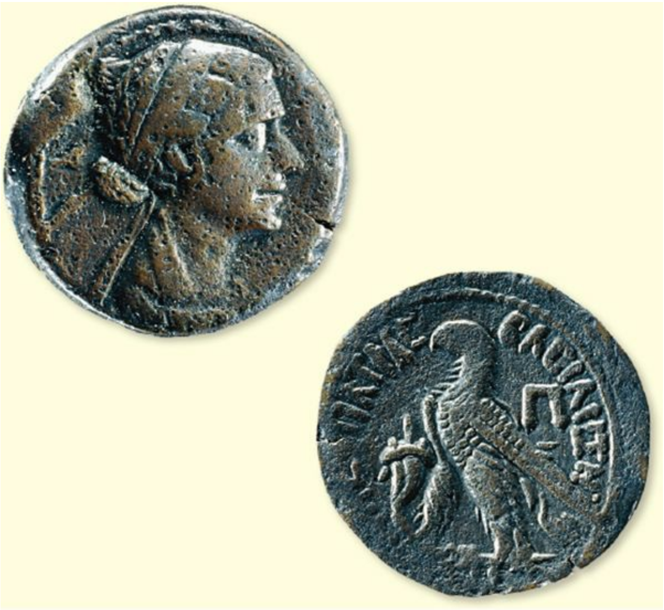
The next reformer, Gaius Marius (ca. 157–86 B.C.E.), recruited landless men into the army to put down a rebel king in Africa. He promised them land for their service. But after his victory, the Senate refused to honor his promise. From then on, Roman soldiers looked to their commanders, not to the Senate or the state, to protect their interests. Rome was also dividing into two political factions, both of which wanted political power. Both factions named individuals as supreme military commander, and each led Roman troops against an external enemy but also against each other. One of these generals, Sulla, gained power in Rome, and in 81 B.C.E. the Senate made him dictator, an official office in the Roman Republic given to a man who was granted absolute power temporarily to handle emergencies such as war. Dictators were supposed to step down after six months, but Sulla held this position for nine years, and after that it was too late to restore the republican constitution.

The history of the late republic is the story of power struggles among many famous Roman figures against a background of unrest at home and military campaigns abroad. Pompey (PAHM-pee) used military victories in Spain to force the Senate to allow him to run for consul. In 59 B.C.E. he was joined in a political alliance called the First Triumvirate by Crassus, another ambitious politician and the wealthiest man in Rome, and by Julius Caesar (100–44 B.C.E.). Born of a noble family, Caesar, an able general, was also a brilliant politician with unbridled ambition and a superb orator with immense literary ability. Recognizing that military success led to power, Caesar led his troops to victory in Spain and Gaul, modern France. The First Triumvirate fell apart after Crassus was killed in battle in 53 B.C.E. while trying to conquer Parthia, leaving Caesar and Pompey in competition with each other for power. The result was civil war. The Ptolemaic rulers of Egypt became mixed up in this war, particularly Cleopatra VII, who allied herself with Caesar and had a son by him. (See “Individuals in Society: Queen Cleopatra,” page 150.) Caesar emerged victorious, and he began to make a number of legal and economic reforms, acting on his own authority, though often with the approval of the Senate, which he packed with his supporters. He issued laws about debt, the collection of taxes, and the distribution of grain and land. Roman allies in Italy were to have full citizenship. He founded new colonies, which were to be populated by veterans and the poor.

Caesar was wildly popular with most people in Rome, but some senators opposed his rise to what was becoming absolute power. In 44 B.C.E. a group of conspirators assassinated him and set off another round of civil war. His grandnephew, the eighteen-year-old Octavian (63 B.C.E.–14 C.E.), joined with two of Caesar’s followers, Marc Antony and Lepidus, in the Second Triumvirate. After defeating Caesar’s murderers, they had a falling-out. Octavian forced Lepidus out of office and waged war against Antony, who had now also become allied with Cleopatra. In 31 B.C.E. Octavian defeated the combined forces of Antony and Cleopatra at the Battle of Actium in Greece. His victory ended the age of civil war. For his success, in 27 B.C.E. the Senate gave Octavian the name Augustus, meaning “revered one.” Although the Senate did not mean this to be a decisive break, that date is generally used to mark the end of the Roman Republic and the start of the Roman Empire.

INDIVIDUALS IN SOCIETY

Queen Cleopatra



© The Trustees of the British Museum/Art Resource, NY

The only portraits of Cleopatra that date from her own lifetime are on the coins that she issued. This one, made at the mint of Alexandria, shows her as quite plain, reinforcing the point made by Cicero that her attractiveness was based more on intelligence and wit than physical beauty. The reverse of the coin shows an eagle, a symbol of rule.

CLEOPATRA VII (69–30 B.C.E.) WAS A PTOLEMY, A MEMBER of the dynasty of Hellenistic rulers of Egypt who had established power in the third century B.C.E. Although she was a Greek, she was passionately devoted to her Egyptian subjects and was the first in her dynasty who could speak Egyptian as well as Greek. Just as ancient pharaohs had linked themselves with the gods, she had herself portrayed as the goddess Isis and may have seen herself as a reincarnation of Isis (see “The Nile and the God-King” in Chapter 2).

At the same time that civil war was raging in the late Roman Republic, Cleopatra and her brother Ptolemy XIII were in a dispute over who would be supreme ruler in Egypt. Julius Caesar captured the Egyptian capital of Alexandria, Cleopatra arranged to meet him, and the two became lovers, although Cleopatra was much younger and Caesar was married. The two apparently had a son, Caesarion, and Caesar's army defeated Ptolemy's army, ending the power struggle. In 46 B.C.E. Cleopatra arrived in Rome, where Caesar put up a statue of her as Isis in one of the city's temples. The Romans hated her because they saw her as a decadent Eastern queen and a threat to what were considered traditional Roman values.

After Caesar's assassination, Cleopatra returned to Alexandria. There she became involved in the continuing Roman civil war that now pitted Octavian, Caesar's heir, against Marc Antony, who commanded the Roman army in the East. When Antony visited Alexandria in 41 B.C.E. he met Cleopatra, and though he was already married to Octavian's sister, he became her lover. He abandoned (and later divorced) his Roman wife, married Cleopatra in 37 B.C.E., and changed his will to favor his children by Cleopatra. Antony's wedding present to Cleopatra was a huge grant of territory, much of it Roman, that greatly increased her power and that of all her children, including Caesarion. Antony also declared Caesarion to be Julius Caesar's rightful heir.

Octavian used the wedding gift as the reason to declare Antony a traitor. He and other Roman leaders described Antony as a romantic fool captivated by the seductive Cleopatra. Roman troops turned against Antony and joined with Octavian, and at the Battle of Actium in 31 B.C.E. Octavian defeated the army and navy of Antony and Cleopatra. Antony committed suicide, as did Cleopatra shortly afterward. Octavian ordered the teenage Caesarion killed, but the young children of Antony and Cleopatra were allowed to go back to Rome, where they were raised by Antony's widow. In another consequence of Octavian's victory, Egypt became a Roman province.

Roman sources are viciously hostile to Cleopatra, and she became the model of the alluring woman whose sexual attraction led men to their doom. Stories about her beauty, sophistication, lavish spending, desire for power, and ruthlessness abounded and were retold for centuries. The most dramatic story was that she committed suicide through the bite of a poisonous snake, which may have been true and which has been the subject of countless paintings. Her tumultuous relationships with Caesar and Antony have been portrayed in plays, novels, movies, and television programs.

QUESTIONS FOR ANALYSIS

1. How did Cleopatra benefit from her relationships with Caesar and Antony? How did they benefit from their relationships with her?
2. How did ideas about gender and Roman suspicion of the more

sophisticated Greek culture combine to shape Cleopatra’s fate and the way she is remembered?

3. “Individuals in Society: Hatshepsut and Nefertiti” in Chapter 2 also focuses on leading female figures in Egypt, but these two women lived more than a thousand years before Cleopatra. How would you compare their situation with hers?

The Successes of Augustus

After Augustus ended the civil wars, he faced the monumental problems of reconstruction. He had to rebuild effective government, pay his army for its services, care for the welfare of the provinces, and address the danger of various groups on Rome's frontiers. Augustus was highly successful in meeting these challenges.

Augustus claimed that he was restoring the republic, but he was actually transforming the government into one in which all power was held by a single ruler. Augustus fit his own position into the republican constitution not by creating a new office for himself but by gradually taking over many of the offices that traditionally had been held by separate people.

The Senate named him often as both consul and tribune. He was also named imperator (ihm-puh-RAH-tuhr), a title given to victorious commanders, and held control of the army, which he made a permanent standing organization. Furthermore, recognizing the importance of religion, he had himself named *pontifex maximus*, or chief priest. The Senate also gave him the honorary title *princeps civitatis*, "first citizen of the state."

Considering what had happened to Julius Caesar, Augustus wisely wielded all this power in the background, and his period of rule is officially called the "principate." The Senate continued to exist as a court of law and deliberative body. Without specifically saying so, however, Augustus created the office of emperor. The English word *emperor* is derived from the Latin word *imperator*, an origin that reflects the fact that Augustus's command of the army was the main source of his power. In other reforms, Augustus made provincial administration more orderly and improved its functioning. He further professionalized the army and awarded grants of land in the frontier provinces to veterans. He encouraged local self-government and the development of cities. As a spiritual bond between the provinces and Rome, Augustus encouraged the cult of *Roma et Augustus* (Rome and Augustus) as the guardian of the state. The cult spread rapidly and became a symbol of Roman unity, part of Roman civic religion. (See "Analyzing the Evidence: Ara Pacis," page 152.) Augustus had himself portrayed on coins standing alongside the goddess Victory and on celebratory stone arches built to commemorate military victories. In addition, he had temples, stadiums, marketplaces, and public buildings constructed in Rome and other cities.

In the social realm, Augustus promoted marriage and childbearing through legal changes that released free women and freedwomen (female slaves who had been freed) from male guardianship if they had given birth to a certain number of children. Men and women who were unmarried or had no children were restricted in the inheritance of property.

Aside from addressing legal issues and matters of state, Augustus actively encouraged poets and writers. For this reason the period of his rule is known as the “golden age” of Latin literature. Roman poets and prose writers celebrated human accomplishments in works that were highly polished, elegant in style, and intellectual in conception.

Augustus as Imperator In this marble statue, found in the villa of Augustus's widow, Augustus is dressed in a military uniform and in a pose usually used to show leaders addressing their troops. This emphasizes his role as imperator, the head of the army. The figures on his breastplate show various peoples the Romans had defeated or with whom they had made treaties, along with assorted deities. Although Augustus did not declare himself a god — as later Roman emperors would — this statue shows him barefoot, just as gods and heroes were in classical Greek statuary, and accompanied by Cupid riding a dolphin, both symbols of the goddess Venus, whom he claimed as an ancestor.

Rome's greatest poet was Virgil (70–19 B.C.E.), whose masterpiece is the *Aeneid* (uh-NEE-id), an epic poem that is the Latin equivalent of the Greek *Iliad* and *Odyssey* (see "The 'Dark Age' " in Chapter 5). Virgil's account of the founding of Rome and the early years of the city gave final form to the legend of Aeneas, the Trojan hero (and ancestor of Romulus and Remus; see "The Founding of Rome") who escaped to Italy at the fall of Troy. As Virgil told it, Aeneas became the lover of Dido (DIGH-doh), the widowed queen of Carthage, but left her because his destiny called him to found Rome. Swearing the destruction of Rome, Dido committed suicide, and, according to Virgil, her enmity helped cause the Punic Wars. In leaving Dido, an "Eastern" queen, Aeneas put the good of the state ahead of marriage or pleasure. The parallels between this story and the real events involving Antony and Cleopatra were not lost on Augustus, who encouraged Virgil to write the *Aeneid* and made sure it was circulated widely immediately after Virgil died.

One of the most significant aspects of Augustus's reign was Roman expansion into northern and western Europe (Map 6.2). Augustus completed the conquest of Spain, founded twelve new towns in Gaul, and saw that the Roman road system linked new settlements with one another and with Italy. After hard fighting, he made the Rhine River the Roman frontier in Germania (Germany). Meanwhile, generals conquered areas as far as the Danube River, and Roman legions penetrated the areas of modern Austria, southern Bavaria, and western Hungary. The regions of modern Serbia, Bulgaria, and Romania also fell. Within this area the legionaries built fortified camps. Roads linked these camps with one another, and settlements grew up around the camps, eventually becoming towns. Traders began to frequent the frontier and to do business with the people who lived there; as a result, for the first time, central and northern Europe came into direct and continuous contact with Mediterranean culture.

Mapping the Past

MAP 6.2 Roman Expansion, 262 B.C.E.–180 C.E. Rome expanded in all directions, eventually controlling every shore of the Mediterranean and vast amounts of land.

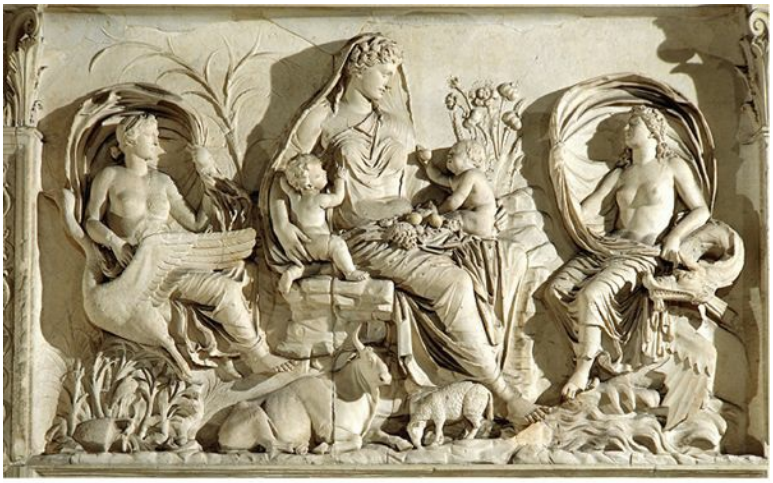
ANALYZING THE MAP How would you summarize the pattern of Roman expansion — that is, which areas were conquered first and which later? How long was Rome able to hold on to territories at the outermost boundaries of its empire?

CONNECTIONS Many of today's major cities in these areas were founded as Roman colonies. Why do you think so many of these cities were founded along the northern border of Roman territory?

Romans did not force their culture on native people in Roman territories. However, just as earlier ambitious people in the Hellenistic world knew that the surest path to political and social advancement lay in embracing Greek culture and learning to speak Greek (see "Building a Hellenized Society" in Chapter 5), those determined to get ahead now learned Latin and adopted aspects of Roman culture.

ANALYZING THE EVIDENCE

Ara Pacis



De Agostini Picture Library/Gianni Dagli Orti/Bridgeman Images

In the middle years of Augustus's reign, the Roman Senate ordered a huge altar, the Ara Pacis, built to honor him and the peace he had brought to the empire, as well as celebrate the traditional Roman civic religion. The altar itself sits inside a walled enclosure made of marble and decorated with elaborate sculptures. These include vines and garlands connoting abundance and control of nature, along with life-size reliefs of Augustus and members of his family, civil servants, priests, women, and children, all in a procession toward a religious sacrifice. Several walls show deities or mythological figures, though they are often so badly damaged that it is not clear what they originally represented. The panel shown here, which is the best preserved, depicts a goddess figure, most likely the goddess Peace herself, with twin babies on her lap, flanked by nymphs representing land and sea and surrounded by plants, fruits, and animals. The altar was built in the flood plain of the Tiber River and gradually became buried under a thick layer of silt. Fragments were gradually discovered and unearthed, and in the 1930s the Fascist government of Italy ordered a complete excavation and reconstruction. Fascist dictator Benito Mussolini moved it to a new protective building near other monuments that honored Augustus as part of his plan to connect Fascist Italy with the glories of ancient Rome.

QUESTIONS FOR ANALYSIS

1. What do the elements depicted here most likely symbolize?
2. The Ara Pacis was a work of public art and political propaganda designed to honor both the deeds of Augustus and traditional Roman civic religion. Why might the Senate have commissioned such a work during this time of transformation in Roman power?
3. Why might the Ara Pacis have been especially appealing to Mussolini? Can you think of other examples of old symbols that have been repurposed for new political uses?

Rome and the Provinces

What was life like in Rome, and what was it like in the provinces?

In the late eighteenth century the English historian Edward Gibbon dubbed the stability and relative peace within the empire that Augustus created the **pax Romana**, the “Roman peace,” which he saw as lasting about two hundred years. People being conquered by the Romans might not have agreed that things were so peaceful, but during this time the growing city of Rome saw great improvements, and trade and production flourished in the provinces. Rome also expanded eastward and came into indirect contact with China.

pax Romana The “Roman peace,” a period during the first and second centuries C.E. of political stability and relative peace.

Political and Military Changes in the Empire

For about fifty years after Augustus’s death in 14 C.E. the dynasty that he established — known as the Julio-Claudians because all were members of the Julian and Claudian clans — provided the emperors of Rome. Two of the Julio-Claudians, Tiberius and Claudius, were sound rulers and created a bureaucracy of able administrators to help them govern. Two of them, Caligula and Nero, were weak and frivolous.

In 68 C.E. Nero’s inept rule led to military rebellion and widespread disruption. Two years later Vespasian (r. 69–79 C.E.), who established the Flavian dynasty, restored order. He also turned Augustus’s principate into a hereditary monarchy and expanded the emperor’s powers. During the brief reign of Vespasian’s son Titus, Mount Vesuvius in southern Italy erupted, destroying Pompeii and other cities and killing thousands of people. (See “Global Viewpoints: Roman and Chinese Officials in Times of Disaster,” at right.) The Flavians (69–96 C.E.) paved the way for the Antonines (96–192 C.E.), a dynasty of emperors under whose leadership the Roman Empire experienced a long period of prosperity and the height of the pax Romana. Wars generally ended victoriously and were confined to the frontiers. Second-century emperors made further changes in government that helped the empire run more efficiently while increasing the authority of the emperor.

The Roman army also saw changes, transforming from a mobile unit to a much larger defensive force, with more and more troops who were noncitizens. Because army service could lead to citizenship, non-Romans joined the army willingly to gain citizenship, receive a salary, and learn a trade. (See “Thinking Like a Historian: Army and Empire,” page 158.) The frontiers became firmly fixed and were defended by a system of forts and walls. Behind these walls, the network of roads was expanded and improved, both to supply the forts and to reinforce them in times of trouble.

GLOBAL VIEWPOINTS

Roman and Chinese Officials in Times of Disaster

Government officials in ancient empires were often confronted with natural disasters, and their response to them was seen as a mark of their character and capabilities, just as it is today. In the first text below, the Roman author Pliny the Younger describes the actions of his uncle Pliny the Elder during the eruption of Mount Vesuvius in 79 C.E. In the second text, the Chinese historian Sima Qian (145–ca. 85 B.C.E.) (see Chapter 7) describes the actions of the official Ji An during a famine.

Pliny the Younger on Pliny the Elder

■ My uncle was stationed at Misenum, in active command of the fleet. On 24 August, in the early afternoon, my mother drew his attention to a cloud of unusual size and appearance…. My uncle's scholarly acumen saw at once that it was important enough for a closer inspection, and he ordered a boat to be made ready, … [but] what he had begun in a spirit of inquiry he completed as a hero. He gave orders for the warships to be launched and went on board himself with the intention of bringing help to many more people…. He hurried to the place which everyone else was hastily leaving, steering his course straight for the danger zone. He was entirely fearless, describing each new movement and phase of the portent to be noted down exactly as he observed them. Ashes were already falling, hotter and thicker as the ships drew near, followed by bits of pumice and blackened stones, charred and cracked by the flames…. He was able to bring his ship in….

Meanwhile on Mount Vesuvius broad sheets of fire and leaping flames blazed at several points, their bright glare emphasized by the darkness of night…. The buildings were now shaking with violent shocks, and seemed to be swaying to and fro as if they were torn from their foundations…. My uncle decided to go down to the shore and investigate on the spot the possibility of any escape by sea, but he found the waves still wild and dangerous…. He stood leaning on two slaves and then suddenly collapsed, I imagine because the dense fumes choked his breathing…. His body was found intact and uninjured, still fully clothed and looking more like sleep than death.

Sima Qian on Ji An

■ During the reign of Emperor Jing, Ji An, on the recommendation of his father, was appointed as a mounted guard to the heir apparent…. When a great fire broke out in Henei and destroyed over 1,000 houses, the emperor … sent Ji An to observe the situation. On his return he reported, “The roofs of the houses were so close together that the fire spread from one to another; that is why so many homes were burned. It is nothing to worry about. As I passed through Henan on my way, however, I noted that the inhabitants were very poor, and over 10,000 families had suffered so greatly from floods and droughts that fathers and sons were reduced to eating each other. I therefore took it upon myself to use the imperial seals to open the granaries of Henan and relieve the distress of the people. I herewith return the seals and await punishment for overstepping my authority in this fashion.”

The emperor, impressed with the wisdom he had shown, overlooked the irregularity of his action and transferred him to the post of governor…. Ji An studied the doctrines of the Yellow Emperor and Lao Zi…. He was sick a great deal of the time, confined to his bed and unable to go out, and yet after only a year or so as governor of Donghai he had succeeded in setting the affairs of the province in perfect order and winning the acclaim of the people.

QUESTIONS FOR ANALYSIS

1. How do the two officials respond to the disasters, and how do the authors of these works judge their responses?
2. What cultural ideals do the authors convey in their descriptions of these officials?

THINKING LIKE A HISTORIAN

Army and Empire

Military might made it possible for the Romans to conquer and hold a huge empire. As the empire grew, the Romans needed to recruit troops from conquered areas and make these soldiers effective, loyal, and dependable. How did the Romans turn countless individuals from diverse cultures into the most powerful fighting force the Mediterranean world had ever seen?

1 **Julius Caesar, *The Gallic War*, 50 B.C.E.** In his account of his successful campaigns in Gaul, designed to present himself as the consummate Roman military leader, Caesar (writing of himself in the third person) describes his efforts to rally his wavering troops.

■ Such a terrible panic suddenly seized our whole army as severely affected everyone's courage and morale. Our men started asking questions, and the Gauls and traders replied by describing how tall and strong the Germans were, how unbelievably brave and skillful with weapons…. The panic began among the military tribunes and prefects, and the other men who, having no great military experience, had followed Caesar from Rome to court his friendship…. They hid themselves away in their tents and bemoaned their fate…. As soon as Caesar was aware of the situation he called a council, ordered centurions of all ranks to attend, and severely reprimanded them…. Why did they despair of their own courage, or of his anxious concern for their well-being? The danger posed by this enemy had already been experienced in the time of our fathers, when the Cimbri and Teutoni were expelled by Gaius Marius. On that occasion it was clear that the army had deserved as much credit as its commander…. From all this, said Caesar, they could see how crucial was firmness of purpose…. The Germans were the same people who had often clashed with the Helvetii — and the Helvetii had frequently beaten them, not only within their own borders but also in Germany itself — and yet the Helvetii had proved no match for our army…. And so, Caesar concluded, he would do at once what he had intended to put off till a later date. The very next night, during the fourth watch, they would strike camp. Then he would know as soon as possible whether their sense of shame and duty was stronger than their fear…. At the end of this speech the change of attitude was quite remarkable, and there arose an immense enthusiasm and eagerness to start the campaign.

2 **Titus Flavius Josephus, *The Jewish War*, ca. 75 C.E.** Josephus was a commander in the Jewish revolt against the Romans in 66 C.E. who after he was taken prisoner went over to the Roman side. Here he describes how he used the Romans as a model for the Jewish army. Like Caesar in Source 1, he writes of himself in the third person.

■ Josephus knew that the invincible might of Rome was chiefly due to unhesitating obedience and to practice in arms. He despaired of providing similar instruction, demanding as it did a long period of training; but he saw that the habit of obedience resulted from the number of their officers, and he now reorganized his army on the Roman model, appointing more junior commanders than before. He divided the soldiers into different classes, and put them under decurions and centurions, those being subordinate to tribunes, and the tribunes to commanders of larger units. He taught them how to pass on signals, how to sound the advance and the retreat, how to make flank attacks and encircling movements, and how a victorious unit could relieve one in difficulties and assist any who were hard pressed. He explained all that contributed to toughness of body or fortitude of spirit. Above all he trained them for war by stressing Roman discipline at every turn: they would be facing men who by physical prowess and unshakable determination had conquered almost the entire world.

3 **Roman military diploma, 71 C.E.** Military diplomas were bronze sheets, wired together, on which a former soldier's tours of duty, record of service, and status as a citizen were recorded. One copy stayed in Rome, and one was sent to the soldier himself, much as members of the military today receive discharge papers.

4 **Roman legion roof plaque.** The legionaries of the Twentieth Legion (Leg. XX) stationed in Britain, whose symbol was a charging boar, made this clay plaque for the roof of one of their buildings.

5 Vegetius, *Epitome of Military Science*, ca. 380–390 C.E.

Vegetius seems to have been a Roman imperial bureaucrat who set out what he saw as ideal military recruitment and training at a point when the Roman Empire was in decline and the army faced many challenges.

■ In every battle it is not numbers and untaught bravery so much as skill and training that generally produce the victory. For we see no other explanation of the conquest of the world by the Roman People than their drill-at-arms, camp-discipline and military expertise…. But what succeeded against all [enemies] was careful selection of recruits, instruction in the rules, so to speak, of war, toughening in daily exercises, prior acquaintance in field practice with all possible eventualities in war and battle, and strict punishment of cowardice. Scientific knowledge of warfare nurtures courage in battle. No one is afraid to do what he is confident of having learned well. A small force which is highly trained in the conflicts of war is more apt to victory: a raw and untrained horde is always exposed to slaughter…. The rural populace is better suited for arms. They are nurtured under the open sky in a life of work, enduring the sun, careless of shade, unacquainted with bathhouses, ignorant of luxury, simple souled, content with a little, with limbs toughened to endure every kind of toil…. If ancient custom is to be retained, everyone knows that those entering puberty should be brought to the levy. For those things are taught not only more quickly but even more completely which are learned from boyhood. Secondly military alacrity, jumping and running should be attempted before the body stiffens with age…. You need not greatly regret the absence of tall stature. It is more useful that soldiers be strong than big…. The youth in whose hands is to be placed the defence of provinces, the fortune of battles, ought to be of outstanding breeding if numbers suffice, and morals. Decent birth makes a suitable soldier, while a sense of shame prevents flight and makes him a victor.

ANALYZING THE EVIDENCE

1. How does Julius Caesar use history and tradition in Source 1 to convince his troops to fight, and what do you think his purpose was in relating this incident as he did?

2. What aspects of the Roman military does Josephus use as a model for his own forces in Source 2? How do these compare with the qualities Vegetius identifies in Source 5 as ideal in the perfect recruit?
3. Why would the promise of eventual citizenship recorded in military diplomas, like the one in Source 3, have been an effective recruiting tool?
4. What does the roof plaque in Source 4 suggest about the self-identity of the soldiers who made it?

PUTTING IT ALL TOGETHER

Using the sources above, along with what you have learned in class and in this chapter, write a short essay that analyzes the military's role in the empire's expansion. How did the Romans turn countless individuals from diverse cultures into the most powerful fighting force the Mediterranean world had ever seen? How would you assess the relative importance of various factors in this transformation, and why might your assessment be different from that of the authors cited here?

Life in Imperial Rome

The expansion and stabilization of the empire created great wealth, much of which flowed into Rome. The city, with a population of over a million, may have been the largest city in the world at that time. Although Rome could boast of stately palaces, noble buildings, and beautiful residential areas, most people lived in shoddily constructed houses and took whatever work was available. Many residents of the city of Rome were slaves, who ranged from highly educated household tutors or government officials or widely sought sculptors to workers who engaged in hard physical tasks.

Fire and crime were perennial problems even in Augustus’s day, and sanitation was poor. In the second century urban planning and new construction greatly improved the situation. For example, engineers built an elaborate system that collected sewage from public baths, the ground floors of buildings, and public latrines. They also built hundreds of miles of aqueducts, most of them underground, to bring fresh water into the city from the surrounding hills.

Rome grew so large that it became ever more difficult to feed its residents. Emperors solved the problem by providing citizens with free oil, wine, and grain for bread. By doing so, they also stayed in favor with the people. They and other sponsors also entertained the people with gladiatorial contests in which participants fought using swords and other weapons. Some gladiators were criminals or prisoners of war, but by the imperial period increasing numbers were volunteers, often poor immigrants who saw gladiatorial combat as a way to support themselves. All gladiators were trained in gladiatorial schools and were legally slaves, although they could keep their winnings and a few became quite wealthy. The Romans were even more addicted to chariot racing than to gladiatorial shows. Winning charioteers were idolized just as sports stars are today.

Gladiator Mosaic Made in the first half of the fourth century C.E., this mosaic from an estate outside Rome includes the name of each gladiator next to the figure. At the top a gladiator stands in a victory pose, while the fallen gladiator at the bottom is marked with the symbol Ø, indicating that he has died in combat. Many of the gladiators in this mosaic, such as those at the left, appear less fit and fearsome than the gladiators depicted in movies, more closely reflecting the reality that gladiatorial combat was a job undertaken by a variety of people.

Prosperity in the Roman Provinces

As the empire grew and stabilized, many Roman provinces grew prosperous through the growth of agriculture, trade, and industry, among other factors. Peace and security opened Britain, Gaul, and the lands of the Danube to settlers from other parts of the Roman Empire. Veterans were given small parcels of land in the provinces, becoming tenant farmers. The garrison towns that grew up around provincial military camps became the centers of organized political life, and some grew into major cities,

The rural population throughout the empire left few records, but the inscriptions that remain point to a melding of cultures. Latin blended with the original language of an area and with languages spoken by those who came into the area later. Slowly what would become the Romance languages of Spanish, Italian, French, Portuguese, and Romanian evolved. Religion was another site of cultural exchange and mixture. Romans moving into an area learned about and began to venerate local gods, and local people learned about Roman ones. Gradually hybrid deities and rituals developed.

Roman Architecture These three structures demonstrate the beauty and utility of Roman architecture. The Coliseum in Rome, a sports arena that could seat fifty thousand spectators, built between 70 C.E. and 80 C.E., was the site of gladiatorial games, animal spectacles, and executions. The Pantheon in Rome, a temple dedicated to all the gods, was built in its present form about 130 C.E., after earlier temples on the site had burned down. Its dome, 140 feet in diameter, remains the largest unreinforced concrete dome in the world. Romans also used concrete for more everyday purposes. The Pont du Gard at Nîmes in France is a bridge over a river that carried an aqueduct supplying millions of gallons of water per day to the Roman city of Nîmes in Gaul; the water flowed in a channel at the very top. Although this bridge was built largely without mortar or concrete, many Roman aqueducts and bridges relied on concrete and sometimes iron rods for their strength.

The Romans were the first to build cities in northern Europe, but in the eastern Mediterranean they ruled cities that had existed before Rome itself was even a village. Here there was much continuity in urban life from the Hellenistic period. There was less construction than in the Roman cities of northern and western Europe because existing buildings could simply be put to new uses.

The expansion of trade during the pax Romana made the Roman Empire an economic as well as a political force. Britain and Belgium became prime grain producers, and Britain’s wool industry probably got its start under the Romans. Italy and southern Gaul produced huge quantities of wine. Roman colonists introduced the olive to southern Spain and northern Africa, which soon produced most of the oil consumed in the western part of the empire. In the East the olive oil production of Syrian farmers reached an all-time high, and Egypt produced tons of wheat that fed the Roman populace.

Glass Beaker by Ennion This exquisite mold-blown glass beaker from the first century C.E. with relief decorations of leaves and basketry has an inscription in Greek: “Ennion made it.” Ennion came from the coastal city of Sidon in modern Lebanon and is one of a very few artisans from the ancient world whose name we know. The fine detail and precision of his work led him to have a powerful influence on the Roman glass industry.

The growth of industry in the provinces was another striking development of this period, as cities in Gaul and Germany eclipsed the old Mediterranean manufacturing centers. Lyons in Gaul and later Cologne in Germany became the new centers of the glassmaking industry, and the cities of Gaul were nearly unrivaled in the manufacture of bronze and brass. Soldiers in the Roman army brought new methods of potterymaking northwards, setting up facilities to make roof tiles, amphoras, and dishes for their units. Some of these grew into industrial-scale kilns that were large enough to fire tens of thousands of pots at once. Fancier pottery often portrayed Greco-Roman gods and heroes, thus spreading Mediterranean myths and stories throughout the empire and beyond. Aided by all this growth in trade and industry, Europe and western Asia were linked in ways they had not been before.

Eastward Expansion and Contacts Between Rome and China

As the Romans drove farther eastward, they encountered the Parthians, who had established a kingdom in what is now Afghanistan and Iran in the Hellenistic period (see “Building a Hellenized Society” in Chapter 5). In the second century the Romans tried unsuccessfully to drive out the Parthians, who came to act as a link between Roman and Chinese merchants. Chinese merchants sold their wares to the Parthians, who then carried the goods overland to Mesopotamia or Egypt, from which they were shipped throughout the Roman Empire. In 226 C.E. the Parthians were defeated by the Sassanids, a new dynasty in the area (see “The Sassanid Empire and Conflicts with Byzantium” in Chapter 8). When the Romans continued their attacks against this new enemy, the Sassanid king Shapur conquered the Roman legions of the emperor Valerian, whom he took prisoner. Shapur employed the captured Roman soldiers and engineers to build roads, bridges, dams, and canals, and their designs and methods were later used throughout the Sassanid empire.

Although warfare disrupted parts of western Asia, it did not stop trade that had prospered from Hellenistic times (see “The Growth of Trade and Commerce” in Chapter 5). Silk was still a major commodity from east to west, along with other luxury goods. In return the Romans traded glassware, precious gems, and slaves. The Parthians added exotic fruits, rare birds, rugs, and other products.

The pax Romana was also an era of maritime trade, and Roman ships sailed from Egyptian ports to the mouth of the Indus River, where Romans purchased local merchandise and wares imported by the Parthians. Some hardy mariners pushed down the African coast and into the Indian Ocean. Roman coins have been found in Sri Lanka and Vietnam, clear evidence of trade connections, although most likely no merchant traveled the entire distance.

The period of this contact coincided with the era of Han greatness in China (see “China and Rome” in Chapter 7). During the reign of the Roman emperor Nerva (r. 96–98 C.E.), a Han emperor sent an ambassador, Gan Ying, to make contact with the Roman Empire. Gan Ying made it as far as the Persian Gulf ports, where he heard about the Romans from Parthian sailors and reported back to his emperor that the Romans were wealthy, tall, and strikingly similar to the Chinese. His report became part of a group of accounts about the Romans and other “western” peoples that circulated widely among scholars and officials in Han China. Educated Romans did not have a corresponding interest in China. For them, China remained more of a mythical than a real place, and they never bothered to learn more about it.

The Coming of Christianity

What was Christianity, and how did it affect life in the Roman Empire?

During the reign of the emperor Tiberius (r. 14–37 C.E.), in the Roman province of Judaea a Jewish man named Jesus of Nazareth preached, attracted a following, and was executed on the order of the Roman prefect Pontius Pilate. Christianity, the religion created by Jesus's followers, came to have an enormous impact first in the Roman Empire and later throughout the world.

Factors Behind the Rise of Christianity

The civil wars that destroyed the Roman Republic left their mark on Judaea, where Jewish leaders had taken sides in the conflict. The turmoil created a climate of violence throughout the area, and among the Jews movements in opposition to the Romans spread. Many Jews came to believe that a final struggle was near and that it would lead to the coming of a savior, or **Messiah**, who would destroy the Roman legions and inaugurate a period of happiness and plenty for Jews. This apocalyptic belief was an old one among Jews, but by the first century C.E. it had become more widespread than ever.

Messiah In Jewish belief, a savior who would bring a period of peace and happiness for Jews; many Christians came to believe that Jesus was that Messiah.

The pagan world also played its part in the story of early Christianity. The term **pagan**, which originally referred to those who lived in the countryside, came to refer to those who practiced religions other than Judaism or Christianity. This included the traditional Roman civic religion devoted to the gods of the hearth, home, and countryside, which had often blended with the worship of other local deities as the Roman Empire expanded. The cult of the emperor, spread through the erection of statues, temples, and monuments, had been added to this, and for some people mystery religions offered the promise of life after death (see Chapter 5). Many people in the Roman Empire practiced all of these religions, combining them in whatever way seemed most beneficial or satisfying to them.

pagan Originally referring to those who lived in the countryside, the term came to mean those who practiced religions other than Judaism or Christianity.

The Life and Teachings of Jesus

Into this climate of Messianic hope and Roman religious blending came Jesus of Nazareth (ca. 3 B.C.E.–29 C.E.). According to Christian Scripture, he was born to deeply religious Jewish parents and raised in Galilee. His ministry began when he was about thirty, and he taught by preaching and telling stories.

Like Socrates and the Buddha, Jesus left no writings. Accounts of his sayings and teachings first circulated orally among his followers and were later written down. The principal evidence for his life and deeds are the four Gospels of the Bible (Matthew, Mark, Luke, and John). These Gospels are records of Jesus's teachings, written sometime in the late first century to build a community of faith. Their authors had probably heard many different people talk about what Jesus said and did, and there are discrepancies among the four accounts. These differences indicate that early followers had a diversity of beliefs about Jesus's nature and purpose.

Depiction of Jesus This mural, from a Roman camp at Dura-Europos on the Euphrates River, may be the earliest known depiction of Jesus. Dating to 235 C.E., it depicts Jesus healing a paralytic man, an incident described in the New Testament. Early Christians used art to spread their message.

However, almost all the early sources agree on certain aspects of Jesus's teachings: he preached of a heavenly kingdom of eternal happiness in a life after death and of the importance of devotion to God and love of others. His teachings were based on Hebrew Scripture and reflected a conception of God and morality that came from Jewish tradition. The Greek translation of the Hebrew word *Messiah* is *Christus*, the origin of the English word *Christ*. Was Jesus the Messiah, the Christ? A small band of followers thought so, and Jesus claimed that he was. Yet Jesus had his own conception of the Messiah. He would establish a spiritual kingdom, not an earthly one.

The Roman official Pontius Pilate knew little about Jesus's teachings. He was concerned with maintaining peace and order. According to the New Testament, crowds followed Jesus into Jerusalem at the time of Passover, a highly emotional point in the Jewish year that marked the Jewish people's departure from Egypt under the leadership of Moses (see "The Hebrew State" in Chapter 2). The prospect that these crowds would spark violence alarmed Pilate. Some Jews believed that Jesus was the long-awaited Messiah. Others hated and feared him because they thought him religiously dangerous. To avert riot and bloodshed, Pilate condemned Jesus to death, and his soldiers carried out the sentence. On the third day after Jesus's crucifixion, some of his followers claimed that he had risen from the dead. For his earliest followers and for generations to come, the resurrection of Jesus became a central element of faith.

The Spread of Christianity

Believers in Jesus's divinity met in small assemblies or congregations, often in one another's homes, to discuss the meaning of Jesus's message and to celebrate a ritual (later called the Eucharist or Lord's Supper) commemorating his last meal with his disciples before his arrest. Because they expected Jesus to return to the world very soon, they regarded earthly life and institutions as unimportant. Only later did these congregations evolve into what came to be called the religion of Christianity, with a formal organization and set of beliefs.

Christian Oil Lamp When Christianity spread in the Roman Empire, many believers purchased household goods with Christian symbols. This pottery lamp for an ordinary home, dating from the fourth century C.E., is marked with a common symbol for Jesus, the letters *XP* (chi rho), the first two letters in Greek for *Christos*, "Christ."

The catalyst in the spread of Jesus's teachings and the formation of the Christian Church was Paul of Tarsus, a well-educated Hellenized Jew. Paul traveled all over the Roman Empire and wrote letters of advice to many groups. These letters were copied and widely circulated, transforming Jesus's ideas into more specific moral teachings. As a result of his efforts, Paul became the most important figure in changing Christianity from a Jewish sect into a separate religion, and many of his letters became part of Christian Scripture.

The breadth of the Roman Empire was another factor behind the spread of Christianity. If all roads led to Rome, they also led outward to the provinces. This enabled early Christians to spread their faith easily throughout the world known to them, as Jesus had told his followers to do. The Romans also considered their empire universal, and the early Christians combined the two concepts of universalism.

Though most of the earliest converts seem to have been Jews, Paul urged that Gentiles, or non-Jews, be accepted on an equal basis. The earliest Christian converts included people from all social classes. These people were reached by missionaries and others who spread the Christian message through family contacts, friendships, and business networks. Many women were active in spreading Christianity. Paul greeted male and female converts by name in his letters and noted that women often provided financial support for his activities. The growing Christian communities differed over the extent to which women should participate in the workings of the religion; some favored giving women a larger role in church affairs, while others were more restrictive.

People were attracted to Christian teachings for a variety of reasons. Christianity was in many ways a mystery religion, offering its adherents special teachings that would give them immortality. But in contrast to traditional mystery religions, Christianity promised this immortality widely, not only to a select few. Christianity also offered the possibility of forgiveness, for believers accepted that human nature is weak and that even the best Christians could fall into sin. But Jesus loved sinners and forgave those who repented. Christianity was also attractive to many because it gave the Roman world a cause. By spreading the word of Christ, Christians played their part in God’s plan for the triumph of Christianity on earth. Christianity likewise gave its devotees a sense of identity and community. To stress the spiritual kinship of this new type of community, Christians often called one another brother and sister. Also, many Christians took Jesus’s commandment to love one another as a guide and provided support for widows, orphans, and the poor, just as they would for family members.

The Growing Acceptance and Evolution of Christianity

At first, most Roman officials largely ignored the followers of Jesus, viewing them simply as one of the many splinter groups within Judaism, but slowly some came to oppose Christian practices and beliefs. They considered Christians to be subversive dissidents because they stopped practicing traditional rituals and they objected to the cult of the emperor. Some Romans thought that Christianity was one of the worst of the mystery cults, with immoral and indecent rituals. Pagans also feared that the Greco-Roman gods would withdraw their favor from the Roman Empire because of the Christian insistence that the pagan gods either did not exist or were evil spirits. And many worried that Christians were trying to destroy the Roman family with their insistence on a new type of kinship.

Persecutions of Christians, including torture and executions, were organized by governors of Roman provinces and sometimes by the emperor, beginning with Nero. Most persecutions were, however, local and sporadic in nature. Responses to Christianity on the part of Roman emperors varied. Some left Christians in peace, while others ordered them to sacrifice to the emperor and the Roman gods or risk death.

By the second century Christianity was changing. The belief that Jesus was soon coming again gradually waned, and as the number of converts increased, permanent institutions were established. These included buildings and a hierarchy of officials often modeled on those of the Roman Empire. **Bishops**, officials with jurisdiction over a certain area, became especially important. They began to assert that they had the right to determine the correct interpretation of Christian teachings and to choose their successors.

bishop A Christian Church official with jurisdiction over a certain area and the power to determine the correct interpretation of Christian teachings.

Christianity also began to attract more highly educated individuals who developed complex theological interpretations of issues that were not clear in scripture. Often drawing on Greek philosophy and Roman legal traditions, they worked out understandings of such issues as how Jesus could be both divine and human and how God could be both a father and a son (and later a spirit as well, a Christian doctrine known as the Trinity). Bishops and theologians often modified teachings that seemed upsetting to Romans, such as Jesus’s harsh words about wealth and family ties. Given all these changes, Christianity became more formal in the second century, with power more centralized.

Turmoil and Reform

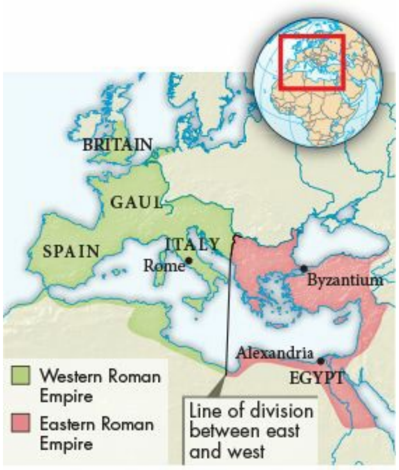
How did the emperors respond to political, economic, and religious issues in the third and fourth centuries?

The prosperity and stability of the second century gave way to a period of domestic upheaval and foreign invasion in the Roman Empire that historians have termed the “crisis of the third century.” Trying to repair the damage was the major work of the emperors Diocletian (r. 284–305) and Constantine (r. 306–337). They enacted political and religious reforms that dramatically changed the empire.

Political Measures

During the crisis of the third century the Roman Empire was stunned by civil war, as different individuals, generally military commanders from the border provinces, claimed rights to leadership of the empire. Beginning in 235, emperors often ruled for only a few years or even months. Army leaders in the provinces declared their loyalty to one faction or another, or they broke from the empire entirely, thus ceasing to supply troops or taxes. Non-Roman groups on the frontiers took advantage of the chaos to invade Roman-held territory along the Rhine and Danube, occasionally even crossing the Alps to maraud in Italy. In the East, Sassanid armies advanced all the way to the Mediterranean. By the time peace was restored, the empire’s economy was shattered, cities had shrunk in size, and many farmers had left their lands.

Diocletian, who had risen through the ranks of the military to become emperor in 284, ended the period of chaos. Under Diocletian the princeps became *dominus*, “lord,” reflecting the emperor’s claim that he was “the elect of god.” To underscore the emperor’s exalted position, Diocletian and his successor, Constantine, adopted the court ceremonies and trappings of the Persian Empire.



Wiesner-Hanks et al., *A History of World Societies*, 11e, © 2018 Bedford/ St. Martin's

The Division of the Roman World, 293 C.E.

Diocletian recognized that the empire had become too large for one man to handle and so in 293 divided it into a western and an eastern half. He assumed direct control of the eastern part, giving a colleague the rule of the western part along with the title *augustus*. Diocletian and his fellow augustus further delegated power by appointing two men to assist them. Each man was given the title *caesar* to indicate his exalted rank.

After a brief civil war following Diocletian's death, Constantine eventually gained authority over the entire empire but ruled from the East. Here he established a new capital for the empire at Byzantium, an old Greek city on the Bosporus, a strait on the boundary between Europe and Asia. He named it "New Rome," though it was soon called Constantinople. In his new capital Constantine built palaces, warehouses, public buildings, and even a hippodrome for horse racing, modeling them on Roman buildings. In addition, he built defensive works along the borders of the empire, trying hard to keep it together, as did his successors. Despite their efforts, however, the eastern and the western halves drifted apart.

The emperors ruling from Constantinople could not provide enough military assistance to repel invaders in the western half of the Roman Empire, and Roman authority there slowly disintegrated. In 476 a Germanic chieftain, Odoacer, deposed the Roman emperor in the West. This date thus marks the official end of the Roman Empire in the West, although the Roman Empire in the East, later called the Byzantine Empire, would last for nearly another thousand years.

Economic Issues

Along with political challenges, major economic problems also confronted Diocletian and Constantine, including inflation and declining tax revenues. In an attempt to curb inflation, Diocletian issued an edict that fixed maximum prices and wages throughout the empire. He and his successors dealt with the tax system just as strictly and inflexibly. Taxes became payable in kind, that is, in goods and services instead of money. All those involved in the growing, preparation, and transportation of food and other essentials were locked into their professions, as the emperors tried to assure a steady supply of these goods. In this period of severe depression, many localities could not pay their taxes. In such cases local tax collectors, who were themselves locked into service, had to make up the difference from their own funds. This system soon wiped out a whole class of moderately wealthy people and set the stage for the lack of social mobility that was a key characteristic of European society for many centuries to follow.

The emperors' measures did not really address Rome's central economic problems. During the turmoil of the third and fourth centuries, many free farmers and their families were killed by invaders or renegade soldiers, or abandoned farms ravaged in the fighting. Consequently, large tracts of land lay untended. Landlords with ample resources began at once to claim as much of this land as they could. The huge estates that resulted, called villas, were self-sufficient and became islands of stability in an unsettled world. In return for the protection and security landlords could offer, many small landholders gave over their lands and their freedom. To guarantee a supply of labor, landlords denied them the freedom to move elsewhere. Free men and women were becoming tenant farmers bound to the land, who would later be called serfs.

The Acceptance of Christianity

The crisis of the third century seemed to some emperors, including Diocletian, to be the punishment of the gods. Diocletian increased persecution of Christians, hoping that the gods would restore their blessing on Rome. Yet his persecutions were never very widespread or long-lived, and by the early fourth century most Romans tolerated Christianity, even if they did not practice it. In several edicts, emperors reversed Diocletian's policy and instead ordered toleration of all religions. (See "Analyzing the Evidence: The Edict of Toleration and the Edict of Milan," at right.) Constantine went beyond toleration to favoring Christianity, expecting in return the support of church officials in maintaining order, and late in his life he was baptized as a Christian. Constantine also freed the clergy from imperial taxation and endowed the building of Christian churches.

Helped in part by its favored position in the empire, Christianity slowly became the leading religion, and emperors after Constantine continued to promote it. In 380 the emperor Theodosius (r. 379–395) made Christianity the official religion of the empire. He allowed the church to establish its own courts and to use its own body of law, called “canon law.” With this he laid the foundation for later growth in church power (see “The Growth of the Christian Church” in Chapter 8).

ANALYZING THE EVIDENCE

The Edict of Toleration and the Edict of Milan

The emperor Diocletian’s persecution of Christians, the last, longest, and harshest official persecution, ended shortly after his death, and the emperors who succeeded him decided instead to tolerate Christianity. In 311 Galerius, senior emperor in the multiheaded late empire, who had been a leading figure in the Diocletian persecutions, issued an edict of toleration legalizing Christianity. In 313 Constantine and Licinius, co-emperors and rivals for power, agreed in a letter to governors of Roman provinces that all religions should be tolerated and property taken from Christians should be returned to them. This letter later became known as the Edict of Milan, but there probably was never a formal edict.

Edict of Toleration (311 C.E.)

Among other arrangements which we are always accustomed to make for the prosperity and welfare of the republic, we had desired formerly to bring all things into harmony with the ancient laws and public order of the Romans, and to provide that even the Christians who had left the religion of their fathers should come back to reason; since, indeed, the Christians themselves, for some reason, had followed such a caprice and had fallen into such a folly that they would not obey the institutes of antiquity, which perchance their own ancestors had first established; but at their own will and pleasure, they would thus make laws unto themselves which they should observe and would collect various peoples in diverse places in congregations. Finally when our law had been promulgated to the effect that they should conform to the institutes of antiquity, many were subdued by the fear of danger, many even suffered death. And yet since most of them persevered in their determination, and we saw that they neither paid the reverence and awe due to the gods nor worshipped the God of the Christians, in view of our most mild clemency and the constant habit by which we are accustomed to grant indulgence to all, we thought that we ought to grant our most prompt indulgence also to these, so that they may again be Christians and may hold their conventicles [religious services], provided they do nothing contrary to good order.

Edict of Milan (313 C.E.)

When I, Constantine Augustus, as well as I, Licinius Augustus, fortunately met near Mediolanurn [Milan], and were considering everything that pertained to the public welfare and security, we thought, among other things which we saw would be for the good of many, those regulations pertaining to the reverence of the Divinity ought certainly to be made first, so that we might grant to the Christians and others full authority to observe that religion which each preferred; whence any Divinity whatsoever in the seat of the heavens may be propitious and kindly disposed to us and all who are placed under our rule. And thus by this wholesome counsel and most upright provision we thought to arrange that no one whatsoever should be denied the opportunity to give his heart to the observance of the Christian religion, or that religion which he should think best for himself, so that the Supreme Deity, to whose worship we freely yield our hearts may show in all things His usual favor and benevolence. Therefore, your Worship [the governor to whom this letter is directed] should know that it has pleased us to remove all conditions whatsoever, which were in the rescripts formerly given to you officially, concerning the Christians and now any one of these who wishes to observe Christian religion may do so freely and openly, without molestation….

Moreover, in the case of the Christians especially we esteemed it best to order that if it happens anyone heretofore has bought from our treasury from anyone whatsoever, those places where they were previously accustomed to assemble, concerning which a certain decree had been made and a letter sent to you officially, the same shall be restored to the Christians without payment or any claim of recompense and without any kind of fraud or deception…. And since these Christians are known to have possessed not only those places in which they were accustomed to assemble, but also other property, namely the churches, belonging to them as a corporation and not as individuals, all these things which we have included under the above law, you will order to be restored, without any hesitation or controversy at all, to these Christians…. Let this be done so that, as we have said above, Divine favor towards us, which, under the most important circumstances we have already experienced, may, for all time, preserve and prosper our successes together with the good of the state.

QUESTIONS FOR ANALYSIS

1. How does Galerius explain his persecution of Christians? His decision to now tolerate them?
2. Why have Constantine and Licinius decided to allow everyone to practice his or her own religion?
3. How do the statements of the emperors fit with Roman ideas about harnessing divine power for the public good, and about the proper role of religion in the state?

Chapter Summary

The Italian peninsula was settled by many different groups, including Greeks in the south and Etruscans in the north. The Etruscans expanded southward into central Italy, where they influenced the culture of the small town that was growing into the city of Rome. Rome prospered and expanded its own territories, establishing a republican government led by the Senate. In a series of wars the Romans conquered the Mediterranean, creating an overseas empire that brought them unheard-of power and wealth, but also social unrest and civil war. The meteoric rise to power of Julius Caesar in the first century B.C.E. led to his assassination, but his grandnephew Augustus finally restored peace and order to Rome. Under Augustus, the republic became an empire.

Augustus and his successors further expanded Roman territories. The city of Rome became the magnificent capital of the empire. The Roman provinces and frontiers also saw extensive prosperity through the growth of agriculture, industry, and trade connections. Christianity, a religion created by the followers of Jesus of Nazareth, spread across the empire, beginning in the first century C.E. Initially some Roman officials and emperors persecuted Christians, but gradually hostility decreased. Emperors in the fourth century first allowed Christianity and then made it the official religion of the empire, one of many measures through which they attempted to solve the problems created by invasions and political turmoil. Their measures were successful in the East, where the Roman Empire lasted for another thousand years, but not in the West, where the Roman Empire ended in the fifth century.

CONNECTIONS

The Roman Empire, with its powerful — and sometimes bizarre — leaders, magnificent buildings, luxurious clothing, and bloody amusements, has long fascinated people. Politicians and historians have closely studied the reasons for its successes and have even more closely analyzed the weaknesses that led to its eventual collapse. Despite the efforts of emperors and other leaders, the Western Roman Empire slowly broke apart and by the fifth century C.E. no longer existed. By the fourteenth century European scholars were beginning to see the fall of the Roman Empire as one of the great turning points in Western history, the end of the classical era. That began the practice of dividing Western history into different periods — eventually, the ancient, medieval, and modern eras. Those categories still shape the way that Western history is taught and learned.

This three-part conceptualization also shapes the periodization of world history. As you saw in Chapter 4 and will see in Chapter 7, China is also understood to have had a classical age. As you will read in Chapter 11, the Maya of Mesoamerica did as well, stretching from 300 C.E. to 900 C.E. South Asia is often described as having a classical period, which developed during the Mauryan Empire that lasted from 322 B.C.E. to 185 B.C.E. as discussed in Chapter 3 and extended to the Gupta Empire that ruled northern India from ca. 320 C.E. to 480 C.E., which will be discussed in Chapter 12. The dates of these ages are different from those of the classical period in the Mediterranean, but there are striking similarities among all these civilizations: successful large-scale administrative bureaucracies were established, trade flourished, cities grew, roads were built, and new cultural forms developed. In all these civilizations this classical period was followed by an era of decreased prosperity and increased warfare and destruction.

Review the Main Ideas

Answer the focus questions from each section of the chapter.

1. How did the Romans come to dominate Italy, and what political institutions did they create? (p. 142)
2. How did Rome expand its power beyond Italy, and what were the effects of this expansion? (p. 146)
3. What was life like in Rome, and what was it like in the provinces? (p. 153)
4. What was Christianity, and how did it affect life in the Roman Empire? (p. 160)
5. How did the emperors respond to political, economic, and religious issues in the third and fourth centuries? (p. 163)

Make Comparisons and Connections

Analyze the larger developments and continuities within and across chapters.

1. What allowed large empires in the ancient world, including the Persian (Chapter 2), the Mauryan (Chapter 3), and the Roman, to govern vast territories and many different peoples successfully?
2. Looking over the long history of Rome, do interactions with non-Romans or conflicts among Romans themselves appear to be the most significant drivers of change? Why? How is this different from other classical civilizations?
3. No classical Chinese thinkers knew about Roman political developments, but the issues they considered, such as how to achieve order and what made

government strong, could also be applied to Rome. How do you think Confucians, Daoists, and Legalists (Chapter 4) would have assessed the Roman Republic? The Roman Empire?

East Asia and the Spread of Buddhism

Ceramic models of attractive young women were often placed in Chinese tombs, reflecting hopes for the afterlife.

East Asia was transformed over the millennium from 221 B.C.E. to 800 C.E. At the beginning of this era, China had just been unified into a single state upon the Qin defeat of all the rival states of the Warring States Period, but it still faced major military challenges with the confederation of the nomadic Xiongnu to its north. At the time China was the only place in East Asia with writing, large cities, and complex state organizations. Over the next several centuries, East Asia changed dramatically as new states emerged. To protect an emerging trade in silk and other valuables, Han China sent armies far into Central Asia. War, trade, diplomacy, missionary activity, and the pursuit of learning led the Chinese to travel to distant lands and people from distant lands to go to China. Among the results were the spread of Buddhism from India and Central Asia to China and the adaptation of many elements of Chinese culture by near neighbors, especially Korea and Japan. Buddhism came to provide a common set of ideas and visual images to all the cultures of East Asia, much the way Christianity linked societies in Europe.

Increased communication stimulated state formation among China’s neighbors: Tibet, Korea, Manchuria, Vietnam, and Japan. Written Chinese was increasingly used as an international language by the ruling elites of these countries, and the new states frequently adopted political models from China as well. By 800 C.E. each of these regions was well on its way to developing a distinct political and cultural identity.

The Age of Empire in China: The Qin and Han Dynasties

What were the social, cultural, and political consequences of the unification of China under the strong centralized governments of the Qin and Han empires?

In much the same period in which Rome created a huge empire, the Qin and Han rulers in China created an empire on a similar scale. Like the Roman Empire, the Chinese empire was put together through force of arms and held in place by sophisticated centralized administrative machinery. The governments created by the Qin and Han Dynasties affected many facets of Chinese social, cultural, and intellectual life.

The Qin Unification, 221–206 B.C.E.

In 221 B.C.E., after decades of constant warfare, Qin (CHIN), the state that had adopted Legalist policies during the Warring States Period (see “Legalism” in Chapter 4), succeeded in defeating the last of its rivals, and China was unified for the first time in many centuries. Deciding that the title “king” was not grand enough, the king of Qin invented the title “emperor” (*huangdi*) (hwang-dee). He called himself the First Emperor in anticipation of a long line of successors. His state, however, did not long outlast him.

Once he ruled all of China, the First Emperor and his shrewd Legalist minister Li Si embarked on a sweeping program of centralization that touched the lives of nearly everyone in China. To cripple the nobility of the defunct states, who could have posed serious threats, the First Emperor ordered the nobles to leave their lands and move to the capital. The private possession of arms was outlawed to make it more difficult for subjects to rebel. The First Emperor dispatched officials to administer the territory that had been conquered and controlled the officials through a long list of regulations, reporting requirements, and penalties for inadequate performance.

Army of the First Emperor The thousands of life-size ceramic soldiers buried in pits about a half mile from the First Emperor's tomb help us imagine the Qin military machine. It was the Qin emperor's concern with the afterlife that led him to construct such a lifelike guard. The soldiers were originally painted in bright colors, and they held real bronze weapons.

To harness the enormous human resources of his people, the First Emperor ordered a census of the population. Census information helped the imperial bureaucracy to plan its activities: to estimate the labor force available for military service and building projects and the tax revenues needed to pay for them. To make it easier to administer all regions uniformly, the Chinese script was standardized, outlawing regional variations in the ways words were written. The First Emperor also standardized weights, measures, coinage, and even the axle lengths of carts. To make it easier for Qin armies to move rapidly, thousands of miles of roads were built, which indirectly facilitated trade. Most of the labor on the projects came from drafted farmers or convicts working out their sentences.

Some modern Chinese historians have glorified the First Emperor as a bold conqueror who let no obstacle stop him, but traditionally he was castigated as a cruel, arbitrary, impetuous, suspicious, and superstitious megalomaniac. Hundreds of thousands of subjects were drafted to build the **Great Wall** (ca. 230–208 B.C.E.), a rammed-earth fortification along the northern border between the Qin realm and the land controlled by the nomadic Xiongnu. After Li Si complained that scholars (especially Confucians) used records of the past to denigrate the emperor’s achievements and undermine popular support, the emperor had all writings other than useful manuals on topics such as agriculture, medicine, and divination collected and burned. As a result of this massive book burning, many ancient texts were lost.

Great Wall A rammed-earth fortification built along the northern border of China during the reign of the First Emperor.

Like Ashoka in India a few decades earlier (see “The Reign of Ashoka” in Chapter 3), the First Emperor erected many stone inscriptions to inform his subjects of his goals and accomplishments. He had none of Ashoka’s modesty, however. On one stone he described his conquest of the other states this way (referring to himself in the third person, as was customary): “He wiped out tyrants, rescued the common people, brought peace to the four corners of the earth. His enlightened laws spread far and wide as examples to All Under Heaven until the end of time. Great is he indeed!”[1]

Assassins tried to kill the First Emperor three times, and perhaps as a consequence he became obsessed with discovering the secrets of immortality. He spent lavishly on a tomb designed to protect him in the afterlife. After he died in 210 B.C.E., the Qin state unraveled. The Legalist institutions designed to concentrate power in the hands of the ruler made the stability of the government dependent on his strength and character, and his heir proved ineffective. The heir was murdered by his younger brother, and uprisings soon followed.

The Han Dynasty, 206 B.C.E.–220 C.E.

The eventual victor in the struggle for power that ensued in the wake of the collapse of the Qin Dynasty was Liu Bang, known in history as Emperor Gaozu (gow-dzoo) (r. 202–195 B.C.E.). The First Emperor of Qin was from the Zhou aristocracy. Gaozu was, by contrast, from a modest family of commoners, so his elevation to emperor is evidence of how thoroughly the Qin Dynasty had destroyed the old order.

Gaozu did not disband the centralized government created by the Qin, but he did remove its most unpopular features. Harsh laws were canceled, taxes were sharply reduced, and a policy of noninterference was adopted in an effort to promote economic recovery. With policies of this sort, relative peace, and the extension of China's frontiers, the Chinese population grew rapidly, reaching 58 million in the census of 2 C.E. (Map 7.1). Few other societies kept such good records, making comparisons difficult, but high-end estimates for the Roman Empire are in a similar range (50–70 million).

MAP 7.1 **The Han Empire, 206 B.C.E.–220 C.E.** The Han Dynasty asserted sovereignty over vast regions from Korea in the east to Central Asia in the west and Vietnam in the south. Once garrisons were established, traders were quick to follow, leading to considerable spread of Chinese material culture in East Asia. Chinese goods, especially silk, were in demand far beyond East Asia, promoting long-distance trade across Eurasia.

The Han government was largely supported by the taxes and forced labor demanded of farmers, but this revenue regularly fell short of the government's needs. To pay for his military campaigns, Emperor Wu, the "Martial Emperor" (r. 141–87 B.C.E.), took over the minting of coins, confiscated the land of nobles, sold offices and titles, and increased taxes on private businesses. In 119 B.C.E. government monopolies were established in the production of iron, salt, and liquor. These enterprises had previously been sources of great profit for private entrepreneurs. Large-scale grain dealing also had been a profitable business, and the government now took that over as well.

Han Intellectual and Cultural Life

In contrast to the Qin Dynasty, which favored Legalism, the Han came to promote Confucianism. The Han government's efforts to recruit men trained in the Confucian classics marked the beginning of the Confucian scholar-official system, one of the most distinctive features of imperial China.

However, the Confucianism that made a comeback during the Han Dynasty was a changed Confucianism. Although Confucian texts had fed the First Emperor's bonfires, some dedicated scholars had hidden their books, and others had memorized whole works. The ancient books recovered in this way — called the **Confucian classics** — were revered as repositories of the wisdom of the past. Confucian scholars treated these classics with piety and attempted to make them more useful as sources of moral guidance by writing commentaries on them. Other Han Confucians developed comprehensive cosmological theories that explained the world in terms of cyclical flows of yin and yang (see "Yin and Yang" in Chapter 4) and the five phases (fire, water, earth, metal, and wood). Natural disasters such as floods or earthquakes were viewed as signs that the emperor had failed in his role of maintaining the proper balance among the forces of Heaven and earth.

Confucian classics The ancient texts recovered during the Han Dynasty that Confucian scholars treated as sacred scriptures.

Han art and literature reveal a fascination with omens, portents, spirits, immortals, and occult forces. Emperor Wu tried to make contact with the world of gods and immortals through elaborate sacrificial offerings of food and wine, and he welcomed astrologers, alchemists, seers, and shamans to his court.

Bronze Mirror The backs of bronze mirrors were frequently decorated with images of deities and animals and with auspicious words. As viewers turned the mirrors, they saw different scenes. This Han mirror features an outer border with semicircles decorated with cloud patterns and squares with words written on them. In the center are deities.

A major intellectual accomplishment of the Han Dynasty was history writing. Sima Qian (SIH-mah chyen) (145–ca. 85 B.C.E.) wrote a comprehensive history of China from the time of the mythical sage-kings of high antiquity to his own day, dividing his account into a chronology recounting political events, biographies of key individuals, and treatises on subjects such as geography, taxation, and court rituals. As an official of the emperor, he had access to important people and to the imperial library. Sima Qian believed fervently in visiting the sites where history was made, examining artifacts, and questioning people about events. The result of his research, ten years or more in the making, was ***Records of the Grand Historian***, a massive work of literary and historical genius. In the chapter devoted to moneymakers, he wrote of families that grew rich from trade or manufacturing, concluding that wealth has no permanent master: “It finds its way to the man of ability like the spokes of a wheel converging upon the hub, and from the hands of the worthless it falls like shattered tiles.”[2] For centuries to come, Sima Qian’s work set the standard for Chinese historical writing, although most of the histories modeled after it covered only a single dynasty. The first of these was the work of three members of the Ban family in the first century C.E. (See “Individuals in Society: The Ban Family,” page 181.)

Records of the Grand Historian A comprehensive history of China written by Sima Qian.

The circulation of books like Sima Qian’s was made easier by the invention of paper, which the Chinese traditionally date to 105 C.E. Scribes had previously written on strips of bamboo and wood or rolls of silk. Cai Lun, to whom the Chinese attribute the invention of paper, worked the fibers of rags, hemp, bark, and other scraps into sheets of paper. Though less durable than wood, paper was far lighter and became a convenient means of conveying the written word.

Inner Asia and the Silk Road

The difficulty of defending against the nomadic pastoral peoples to the north in the region known as Inner Asia is a major reason China came to favor a centralized bureaucratic form of government. Resources from the entire subcontinent were needed to maintain control of the northern border.

Chinese civilization did not spread easily to the grasslands north of China proper, because those lands were too dry and cold to make good farmland. Herding sheep, horses, camels, and other animals made better economic use of those lands. By the third century B.C.E. several different peoples practicing nomadic pastoralism lived in those regions, moving with their herds north in summer and south in winter. Families lived in tents that could be taken down and moved to the next camp. Herds were tended on horseback, and everyone learned to ride from a young age. The differences in their ways of life led Chinese farmers and Inner Asian herders to look down on each other. For most of the imperial period, Chinese farmers looked on the northern non-Chinese horsemen as gangs of bullies who thought robbing was easier than working for a living. The nomads identified glory with military might and viewed farmers as contemptible weaklings.

In the late third century B.C.E. the Xiongnu (shyuhng-new) (possibly the same group that was known in the West as the Huns) formed the first great confederation of nomadic tribes (see Map 7.1). The Qin’s Great Wall was built to defend against the Xiongnu, and the Qin sent out huge armies in pursuit of them. The early Han emperors tried to make peace with them, offering generous gifts of silk, rice, cash, and even imperial princesses as brides, but to little avail. Xiongnu power did not wane, and in 166 B.C.E. 140,000 Xiongnu raided to within a hundred miles of the Chinese capital.

Emperor Wu then decided that China had to push the Xiongnu back. He sent several armies of 100,000 to 300,000 troops deep into Xiongnu territory. These costly campaigns were of limited value because the Xiongnu were a moving target. If the Xiongnu did not want to fight the Chinese troops, they simply moved their camps. To try to find allies and horses, Emperor Wu turned his attention west, toward Central Asia. From an envoy he sent into Bactria, Parthia, and Ferghana in 139 B.C.E., the Chinese learned for the first time of other civilized states comparable to China. These regions, he reported, were familiar with Chinese products, especially silk, and did a brisk trade in them.

In 114 B.C.E. Emperor Wu sent an army into Ferghana and gained recognition of Chinese overlordship in the area, thus obtaining control over the trade routes across Central Asia commonly called the **Silk Road** (Map 7.2).

MAP 7.2 The Silk Trade in the Seventh Century C.E. Silk — made from the cocoons of silkworms — was highly valued for the light, colorful, and supple cloth that could be made from it. For centuries all the silk that reached the non-Chinese world came from China, but in time other countries learned how to make it.

At the same time, Emperor Wu sent troops into northern Korea to establish military districts that would flank the Xiongnu on their eastern border. By 111 B.C.E. the Han government also had extended its rule south into Nam Viet, which extended from south China into what is now northern Vietnam.

During the Han Dynasty, China developed a **tributary system** to regulate contact with foreign powers. States and tribes beyond its borders sent envoys bearing gifts and received gifts in return. Over the course of the dynasty, the Han government's outlay on these gifts was huge, perhaps as much as 10 percent of state revenue. Although the tributary system was a financial burden to the Chinese, it reduced the cost of defense and offered China confirmation that it was the center of the civilized world.

tributary system A system first established during the Han Dynasty to regulate contact with foreign powers. States and tribes beyond its borders sent envoys bearing gifts and received gifts in return.

The silk given to the Xiongnu and other northern tributaries often entered the trading networks of Persian, Parthian, and Indian merchants, who carried it by caravans across Asia. There was a market both for skeins of silk thread and for silk cloth woven in Chinese or Syrian workshops. Caravans returning to China carried gold, horses, and occasionally handicrafts of West Asian origin, such as glass beads and cups. Through the trade along the Silk Road, the Chinese learned of new foodstuffs, including walnuts, pomegranates, sesame, and coriander, all of which came to be grown in China. (See “Thinking Like a Historian: Who Made the Chinese Silks Found Along the Silk Road?” page 178.)

Xiongnu Metalwork The metal ornaments of the Xiongnu provide convincing evidence that they were in contact with nomadic pastoralists farther west in Asia, such as the Scythians, who also fashioned metal plaques and buckles in animal designs.

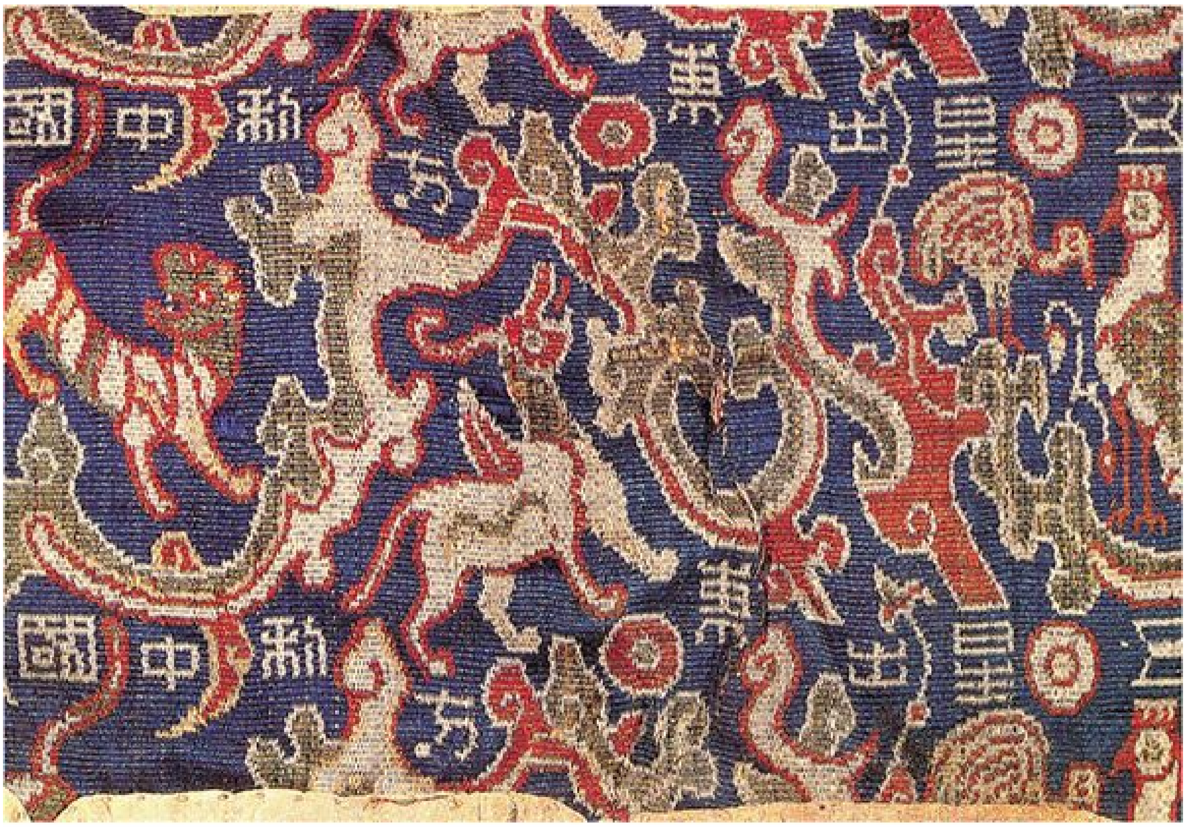
Maintaining a military presence so far from the center of China was expensive. To cut costs, the government set up self-supporting military colonies, recruited Xiongnu tribes to serve as auxiliary forces, and established vast government horse farms. Still, military expenses threatened to bankrupt the Han government.

THINKING LIKE A HISTORIAN

Who Made the Chinese Silks Found Along the Silk Road?

Many fine pieces of Chinese silk have been found in the Silk Road cities. These silks were transported far from where they were made. Some are of very high quality and must have been woven by highly skilled craftsmen. Were they made in palace workshops? By men or by women? By servants or by slaves? In private workshops? By women weaving at home? The fragmentary sources can be read more than one way.

1 **Multicolor brocade found in Niya, along the southern branch of the Silk Road.** Woven into this late Han (second century C.E.) textile are the Chinese characters saying, "Five stars rising in the East is auspicious for the Middle Kingdom."



Pictures from History/Bridgeman Images

2 **Liu Xiang, *Biographies of Exemplary Women*, ca. 18 B.C.E.** Traditionally, producing cloth was thought of as women's work, whether it involved coarser materials like hemp or the more time-consuming silk, which involved picking mulberry leaves, feeding the silkworms until they spun their cocoons, reeling and twisting the fibers, and then weaving cloth and sewing it into clothing. This sentiment can be seen in a set of women's biographies, compiled by Liu Xiang near the midpoint of the Han period. In his account of the wife of Bao Song, she objects to a proposal to remarry, using the following words.

■ Once a woman drinks from the marriage cup, she does not waver. When her husband dies, she does not remarry. She manages hempen fibers, processes the silk cocoons, weaves silk fabric, and fashions cords to supply clothing and provide for her husband.

3 **Miscellaneous records of the Western capital, ca. 80 B.C.E.** This collection of anecdotes mentions home production of elaborate textiles at a private family textile workshop in Chang'an.

■ He Guang's wife gave Shunyu Yan twenty-four bolts of silk brocade in the "grape" pattern and twenty-five bolts of thin silk with the "scattered flowers" pattern. The thin silk had been made at the home of Chen Baoguang in Julu. The technique had been passed down in the family of Baoguang's wife. [He Guang's wife] He Xian had invited [Baoguang's wife] to come to her home and set up [a loom] to make it. The apparatus had 120 *nie* and it took sixty days to produce one bolt, worth ten thousand coins.

4 **Xuanzang, Account of silkmaking knowledge, 646 C.E.** When the monk Xuanzang traveled from China to India in the seventh century (629–645 C.E.), he heard a story about how the town of Khotan acquired silkmaking knowledge. According to his account, the king sent an envoy to ask for a princess from the Eastern Country. In the following excerpt, he describes what happened next.

■ He then ordered his envoy to tell the bride, "Our kingdom lacks the arts of silk, mulberry seed and silkworm egg. You must bring them with you in order to be able to make your own silk clothes." When the lady heard these words, she secretly placed mulberry seeds and silkworm eggs in her headdress … and in this fashion the secret was brought to Khotan.

5 **An official's account of women and silkmaking skills, ca. 765 C.E.** An official serving in south China in the 760s C.E. saw women as essential links in the transmission of silkmaking skills.

■ In the beginning, the people of Yue were not skilled at working the shuttle and loom. When Xue Jianxun was given command to oversee the area east of the Yangtze, he recruited soldiers who had not yet settled into a home and, generously supplying them with cash, ordered them to marry women from the north who were skilled at weaving. Their numbers surpassed several thousands. From this time the customs of the Yue changed as they competed to become more cultured. *Ling* damasks and open-weave gauzes began to be identified as items from "the left of the Yangtze."

6 **Silk banner from Dunhuang.** Woven into this fourth- or fifth-century-C.E. banner are images of dragons, tigers, phoenixes, and vermilion birds, which are Chinese symbols of the four directions.

ANALYZING THE EVIDENCE

1. Which of these sources provides the strongest evidence that women wove complex silks? What is the basis for your answer?
2. The accounts in Sources 2–5 were written over a period of almost a thousand years. How do the dates of these sources factor into your analysis of them?
3. What, if anything, do the early silks in Sources 1 and 6 add to our understanding of silkmaking?
4. Does it make much of a difference to our understanding of Chinese society if we see women as the primary producers of silk? Explain your answer.

PUTTING IT ALL TOGETHER

Using the sources above, along with what you have learned in class and in this chapter, write a short essay that analyzes early Chinese understandings of women's work.

Life in Han China

How were ordinary people's lives affected by the creation of a huge Han bureaucratic empire? The lucky ones who lived in Chang'an or Luoyang, the great cities of the empire, got to enjoy the material benefits of increased long-distance trade and a boom in the production of luxury goods.

The government did not promote trade per se. The Confucian elite, like ancient Hebrew wise men, considered trade necessary but lowly. Agriculture and crafts were more honorable because they produced something, but merchants merely took advantage of others' shortages to make profits as middlemen. This attitude justified the government's takeover of the grain, iron, and salt businesses.

Markets were the liveliest places in the cities. Besides stalls selling goods of all kinds, markets offered fortune-tellers, jugglers, acrobats, and puppet shows. The markets were also used for the execution of criminals, to serve as a warning to onlookers.

Government patronage helped maintain the quality of craftsmanship in the cities. By the beginning of the first century C.E. China also had about fifty state-run ironworking factories. In contrast to Roman blacksmiths, who hammered heated iron to make wrought iron tools, the Chinese knew how to liquefy iron and pour it into molds, producing tools with a higher carbon content that were harder and more durable. Iron was replacing bronze in tools, but bronzeworkers still turned out a host of goods, including jewelry and mirrors. Bronze was also used for coins and for precision tools such as carpenters' rules and adjustable wrenches.

The bulk of the population in Han times and even into the twentieth century consisted of peasants living in villages of a few hundred households. Because the Han empire, much like the contemporaneous Roman Empire, drew its strength from a large population of free peasants who contributed both taxes and labor services to the state, the government had to try to keep peasants independent and productive. To fight peasant poverty, the government kept land taxes low (one-thirtieth of the harvest), provided relief in times of famine, and promoted up-to-date agricultural methods. Still, many hard-pressed peasants were left to choose between migration to areas where new lands could be opened and quasi-servile status as the dependents of a magnate. Throughout the Han period, Chinese farmers in search of land to till pushed into frontier areas, expanding Chinese domination at the expense of other ethnic groups, especially in central and south China.

The Chinese family in Han times was much like Roman and Indian families. In all three societies senior males had great authority, parents arranged their children’s marriages, and brides normally joined their husbands’ families. Other practices were more distinctive to China, such as the universality of patrilineal family names, the practice of dividing land equally among the sons in a family, and the great emphasis placed on the virtue of filial piety. The brief *Classic of Filial Piety*, which claimed that filial piety was the root of all virtue, gained wide circulation in Han times. The virtues of loyal wives and devoted mothers were extolled in *Biographies of Exemplary Women*, which told the stories of women from China’s past. One of the most commonly used texts for the education of women was *Admonitions for Women* by Ban Zhao, in which she extols the feminine virtues, such as humility. (See “Individuals in Society: The Ban Family,” at right.)

Ban Zhao, Han Dynasty writer.

BAN BIAO (3–54 C.E.), A SUCCESSFUL OFFICIAL FROM A family with an envied library, had three highly accomplished children: his twin sons, the general Ban Chao (32–102) and the historian Ban Gu (32–92); and his daughter, Ban Zhao (ca. 45–120). After distinguishing himself as a junior officer in campaigns against the Xiongnu, Ban Chao was sent in 73 C.E. to the western regions to see about the possibility of restoring Chinese overlordship there, which had been lost several decades earlier. Ban Chao spent most of the next three decades in Central Asia. Through patient diplomacy and a show of force, he re-established Chinese control over the oasis cities of Central Asia, and in 92 he was appointed protector general of the area.

His twin brother, Ban Gu, was one of the most accomplished writers of his age, excelling in a distinctive literary form known as the rhapsody (*fu*). His "Rhapsody on the Two Capitals" is in the form of a dialogue between a guest from Chang'an and his host in Luoyang. It describes the palaces, spectacles, scenic spots, local products, and customs of the two great cities. Emperor Zhang (r. 76–88) was fond of literature and often had Ban Gu accompany him on hunts or travels. He also had him edit a record of the court debates he held on issues concerning the Confucian classics.

Ban Biao was working on the *History of the Former Han Dynasty* when he died in 54. Ban Gu took over this project, modeling it on Sima Qian's *Records of the Grand Historian*. He added treatises on law, geography, and bibliography, the last a classified list of books in the imperial library.

Because of his connection to a general out of favor, Ban Gu was sent to prison in 92, where he soon died. At that time the *History of the Former Han Dynasty* was still incomplete. The emperor called on Ban Gu's widowed sister, Ban Zhao, to finish it. She came to the palace, where she not only worked on the history but also became a teacher of the women of the palace. According to the *History of the Later Han*, she taught them the classics, history, astronomy, and mathematics. In 106 an infant succeeded to the throne, and the widow of an earlier emperor became regent. This empress frequently turned to Ban Zhao for advice on government policies.

Ban Zhao credited her own education to her learned father and cultured mother and became an advocate of the education of girls. In her *Admonitions for Women*, Ban Zhao objected that many families taught their sons to read but not their daughters. She did not claim girls should have the same education as boys; after all, "just as yin and yang differ, men and women have different characteristics." Women, she wrote, will do well if they cultivate womanly virtues such as humility. "Humility means yielding and acting respectful, putting others first and oneself last, never mentioning one's own good deeds or denying one's own faults, enduring insults and bearing with mistreatment, all with due trepidation."* In subsequent centuries Ban Zhao's *Admonitions* became one of the most commonly used texts for the education of Chinese girls.

QUESTIONS FOR ANALYSIS

1. What inferences can you draw from the fact that a leading general had

a brother who was a literary man?

2. What does Ban Zhao’s life tell us about women in her society? How do you reconcile her personal accomplishments with the advice she gave for women’s education?

China and Rome

The empires of China and Rome were large, complex states governed by monarchs, bureaucracies, and standing armies. Both lasted for centuries and reached the people directly through taxation and conscription policies. Both invested in infrastructure such as roads and waterworks. Both saw their civilization as better than any other and were open to others' learning their ways. The two empires faced the similar challenge of having to work hard to keep land from becoming too concentrated in the hands of hard-to-tax wealthy magnates. In both empires people in neighboring areas that came under political domination were attracted to the conquerors' material goods, productive techniques, and other cultural products, resulting in gradual cultural assimilation. China and Rome also had similar frontier problems and tried similar solutions, such as recruiting "barbarian" soldiers and settling soldier-colonists.

Nevertheless, the differences between Rome and Han China are also worth noting. The Roman Empire was linguistically and culturally more diverse than China. In China there was only one written language; people in the Roman Empire still wrote in Greek and several other languages, and people in the eastern Mediterranean could claim more ancient civilizations. China did not have comparable cultural rivals. Politically the dynastic principle was stronger in China than in Rome, and there was no institution comparable to the Roman Senate. In contrast to the graduated forms of citizenship in Rome, citizenship in Han China made no distinctions between original and added territories. The social and economic structures also differed in the two empires. Slavery was much more important in Rome than in China, and merchants were more favored.

The Fall of the Han and the Age of Division

In the second century C.E. the Han government suffered a series of blows. A succession of child emperors required regents to rule in their place until they reached maturity, allowing the families of empresses to dominate the court. Emperors, once grown, turned to **eunuchs** (castrated palace servants) for help in ousting the empresses' families, only to find that the eunuchs were just as difficult to control. In 166 and 169 scholars who had denounced the eunuchs were arrested, killed, or banished from the capital and official life. Then in 184 a millenarian religious sect rose in massive revolt. The armies raised to suppress the rebels soon took to fighting among themselves. After years of fighting, a stalemate was reached, with three warlords each controlling distinct territories in the north, the southeast, and the southwest. In 220 one of them forced the last of the Han emperors to abdicate, formally ending the Han Dynasty.

eunuchs Castrated males who played an important role as palace servants.

The period after the fall of the Han Dynasty is often referred to as the **Age of Division** (220–589). A brief reunification from 280 to 316 came to an end when non-Chinese who had been settling in north China since Han times attempted to take power. For the next two and a half centuries, north China was ruled by one or more non-Chinese dynasties (the Northern Dynasties), and the south was ruled by a sequence of four short-lived Chinese dynasties (the Southern Dynasties) centered in the area of the present-day city of Nanjing.

Age of Division The period after the fall of the Han Dynasty, when China was politically divided.

In the south a hereditary aristocracy entrenched itself in the higher reaches of officialdom. These families saw themselves as maintaining the high culture of the Han and looked on the emperors of the successive dynasties as upstarts — as military men rather than men of culture. In this aristocratic culture the arts of poetry and calligraphy flourished, and people began collecting writings by famous calligraphers.

Establishing the capital at Nanjing, south of the Yangzi River, had a beneficial effect on the economic development of the south. The south, with its temperate climate and ample supply of water, offered nearly unlimited possibilities for such development.

The Northern Dynasties are interesting as the first case of alien rule in China. Ethnic tensions flared from time to time. In the late fifth century the Northern Wei (way) Dynasty (386–534) moved the capital from near the Great Wall to the ancient city of Luoyang, adopted Chinese-style clothing, and made Chinese the official language. But the armies remained in the hands of the non-Chinese Xianbei tribesmen. Soldiers who saw themselves as marginalized by the pro-Chinese reforms rebelled in 524. For the next fifty years north China was torn apart by struggles for power.

The Spread of Buddhism Out of India

How did Buddhism find its way into East Asia, and what was its appeal and impact?

In much the same period that Christianity was spreading out of its original home in ancient Israel, Buddhism was spreading beyond India. Buddhism came to Central, East, and Southeast Asia with merchants and missionaries along the overland Silk Road, by sea from India and Sri Lanka, and also through Tibet. Like Christianity, Buddhism was shaped by its contact with cultures in the different areas into which it spread, leading to several distinct forms.

Buddhism's Path Through Central Asia

Under Ashoka in India (see "The Reign of Ashoka" in Chapter 3), Buddhism began to spread to Central Asia. This continued under the Kushan empire (ca. 50–250 C.E.). Over the next several centuries most of the city-states of Central Asia became centers of Buddhism, from Bamiyan northwest of Kabul, to Kucha, Khotan, Loulan, Turfan, and Dunhuang (Map 7.3).

Mapping the Past

MAP 7.3 The Spread of Buddhism, ca. 500 B.C.E.–800 C.E. Buddhism spread throughout India in Ashoka's time and beyond India in later centuries. The different forms of Buddhism found in Asia today reflect this history. The Mahayana Buddhism of Japan came via Central Asia, China, and Korea, with a secondary later route through Tibet. The Theravada Buddhism of Southeast Asia came directly from India and indirectly through Sri Lanka.

ANALYZING THE MAP Trace the routes of the spread of Buddhism by time period. How fast did Buddhism spread?

CONNECTIONS Why do you think Buddhism spread more to the east of India than to the west?

The form of Buddhism that spread from Central Asia to China, Japan, and Korea was called Mahayana, which means "Great Vehicle," reflecting the claims of its adherents to a more inclusive form of the religion. Influenced by the Iranian religions then prevalent in Central Asia, Buddhism became more devotional. The Buddha came to be treated as a god, the head of an expanding pantheon of other Buddhas and bodhisattvas (Buddhas-to-be). With the growth of this pantheon, Buddhism became as much a religion for laypeople as for monks and nuns.

Monumental Rock-Cut Buddha at Yungang The Xianbei rulers of the Northern Wei funded the carving of Buddhist statues at Yungang in the late fifth century. The tallest of these statues, shown here, is about 45 feet high; it is one of about fifty-one thousand Buddha images at the site. The massive stone Buddha at Bamiyan in Afghanistan provided a model for cave temples like this one in China.

The Appeal and Impact of Buddhism in China

Why did Buddhism find so many adherents in China during the three centuries from 200 to 500 C.E.? There were no forced conversions, but still the religion spread rapidly. In the unstable political environment, many people were open to new ideas. To Chinese scholars the Buddhist concepts of the reincarnation of souls, karma, and nirvana posed a stimulating intellectual challenge. To rulers the Buddhist religion offered a source of magical power and a political tool to unite Chinese and non-Chinese. In a tumultuous age Buddhism’s emphasis on kindness, charity, and eternal bliss was deeply comforting. As in India, Buddhism posed no threat to the social order, and the elite who were drawn to Buddhism encouraged its spread to people of all classes.

Meditating Monk This monk, wearing the traditional patchwork robe, sits in the crossed-legged meditation position. His small niche is to the left of the main image of the Buddha in cave 285 at Dunhuang, a cave completed in 539 C.E. under the patronage of a prince of the Northern Wei imperial house who was then the local governor.

The monastic establishment grew rapidly in China. Like their Christian counterparts in medieval Europe, Buddhist monasteries played an active role in social, economic, and political life. Given the importance of family lines in China, becoming a monk was a major decision, since a man had to give up his surname and take a vow of celibacy, thus cutting himself off from the ancestral cult. Those not ready to become monks or nuns could pursue Buddhist goals as pious laypeople by performing devotional acts and making contributions to monasteries.

In China women turned to Buddhism as readily as men. Although birth as a female was considered lower than birth as a male, it was also viewed as temporary, and women were encouraged to pursue salvation on terms nearly equal to those of men. Joining a nunnery became an alternative for a woman who did not want to marry or did not want to stay with her husband's family in widowhood. (See "Analyzing the Evidence: Sixth-Century Biographies of Buddhist Nuns," above.) Later, the only woman ruler of China, Empress Wu, invoked Buddhist principles to justify her role (see "The Tang Dynasty"), further evidence of how Buddhism brought new understandings of gender.

Buddhism had an enormous impact on the visual arts in China, especially sculpture and painting. Before Buddhism, Chinese had not set up statues of gods in temples, but now they decorated temples with a profusion of images. Inspired by the cave temples of India and Central Asia, Buddhists in China, too, carved caves into rock faces to make temples.

Not everyone was won over by Buddhist teachings. Critics of Buddhism labeled it immoral, unsuited to China, and a threat to the state since monastery land was not taxed and monks did not perform labor service. Although twice rulers closed monasteries, no attempt was made to suppress belief in Buddhism, and the religion continued to thrive in the subsequent Sui and Tang periods.

ANALYZING THE EVIDENCE

Sixth-Century Biographies of Buddhist Nuns

Women drawn to Buddhism could leave secular life to become nuns. Most nuns lived with other nuns in convents, but they could also work to spread Buddhist teachings outside the cloister. The first collection of biographies of eminent nuns in China was written in 516. Among the sixty-five nuns whose lives it recounted are these three.

Kang Minggan

Minggan’s secular surname was Zhu, and her family was from Kaoping. For generations the family had venerated the [Buddhist] teachings known as the Great Vehicle.

A bandit who wanted to make her his wife abducted her, but, even though she suffered increasing torment, she vowed not to give in to him. She was forced to serve as a shepherdess far from her native home. Ten years went by and her longing for her home and family grew more and more intense, but there seemed to be no way back. During all this she kept her mind fixed on the Three Treasures, and she herself wished to become a nun.

One day she happened to meet a Buddhist monk, and she asked him to bestow on her the five fundamental precepts [of a Buddhist householder]. He granted her request and also presented her with a copy of the Bodhisattva Guanshiyin Scripture, which she then practiced chanting day and night without pause.

Deciding to return home to build a five-story pagoda, she fled to the east in great anxiety and distress. At first she did not know the road but kept traveling both day and night. When crossing over a mountain she saw a tiger lying only a few steps away from her. After momentary terror she composed her mind, and her hopes were more than met, for the tiger led the way for her, and, after the days had grown into weeks, she finally arrived in her home territory of Qing Province. As she was about to enter the village, the tiger disappeared, but at that moment, having arrived in the province, Minggan was again abducted, this time by Ming Bolian. When word reached her family, her husband and son ransomed her, but the family did not let her carry out her wishes [to enter the life of a Buddhist nun]. Only after three years of cultivating stringent religious practices was she able to follow her intention. As a nun, she especially concentrated on the cultivation of meditation, and she kept all the regulations of a monastic life without any transgressions. If she happened to commit a minor fault, she would confess it several mornings in a row, ceasing only after she received a sign or a good omen. Sometimes as a good omen she saw flowers rain down from the sky or she heard a voice in the sky or she saw a Buddha image or she had auspicious dreams.

As Minggan approached old age, her moral cultivation was even more strict and lofty. All the men and women north of the Yangtze River honored her as their spiritual teacher in whom they could take refuge.

In the spring of 348 of the Jin dynasty, she, together with Huichan and others — ten in all — traveled south, crossed the Yangtze River, and went to see the minister of public works, He Chong, in the capital of the Eastern Jin dynasty. As soon as he met them, he showed them great respect. Because at that time there were no convents in the capital region He Chong converted one of his private residences into a convent for them.

He asked Minggan, “What should the convent be named?”

She replied, “In the great realm of the Jin dynasty all the four Buddhist assemblies of monks, nuns, and male and female householders are now established for the first time. Furthermore, that which you as donor have established will bestow blessings and merit. Therefore, let us call the convent ‘Establishing Blessings Convent.’” He Chong agreed to her suggestion. Not long afterward Minggan took sick and died.

Daoqiong

Daoqiong’s secular surname was Jiang. Her family was from Danyang. When she was a little more than ten years old, she was already well educated in the classics and history, and after her full admission to the monastic assembly she became learned in the Buddhist writings as well and also diligently cultivated a life of asceticism. In the Taiyuan reign period [376–396] of the Eastern Jin dynasty, the empress admired her exalted conduct, and, whenever she wished to gain merit by giving gifts or by listening to religious exhortations, she most often depended on the convent where Daoqiong lived for such opportunities. Ladies of noble family vied with one another to associate with Daoqiong.

In 431 she had many Buddhist images made and placed them everywhere: in Pengcheng Monastery, two gold Buddha images with a curtained dais and all accessories; in Pottery Office Monastery, a processional image of Maitreya, the future Buddha, with a jeweled umbrella and pendants; in Southern Establishing Joy Monastery, two gold images with various articles, banners, and canopies. In Establishing Blessings Convent, she had an image of the reclining Buddha made, as well as a hall to house it. She also had a processional image of the bodhisattva, Puxian [or Samantabhadra], made. Of all these items, there was none that was not extremely beautiful. Again, in 438, Daoqiong commissioned a gold Amitayus [or Infinite Life] Buddha, and in the fourth month and tenth day of that same year a golden light shone forth from the mark between the eyebrows of the image and filled the entire convent. The news of this event spread among religious and worldly alike, and all came to pay honor, and, gazing at the unearthly brilliance, there was none who was not filled with great happiness. Further, using the materials bequeathed to her by the Yuan empress consort, she extended the convent to the south to build another meditation hall.

Daozong

Daozong, whose family origins are unknown, lived in Three-Story Convent in Jiangling. As a child she had no intention of setting herself apart; as an adult she did not consider associating with others a defilement. She merely followed a course along the boundary between the wise and the foolish, and, although outwardly she seemed muddled, yet within she traversed hidden profundities.

On the full-moon night of the fifteenth day of the third month, in 463 …, Daozong, as an offering to the Buddha, purified herself in a fire fed by oil. Even though she was engulfed by flames up to her forehead, and her eyes and ears were nearly consumed, her chanting of the scriptures did not falter. Monastics and householders sighed in wonder; the demonic and upright were alike startled. When the country heard this news, everyone aspired to attain enlightenment. The appointed court scholar …, Liu Qiu, especially revered her and composed a Buddhist-style poetic verse to praise her.

QUESTIONS FOR ANALYSIS

1. Why were the lives of these three particular nuns considered worth recording? What was admirable or inspiring about their examples?
2. What do the nuns’ spiritual journeys reveal about the virtues associated with Buddhist monastic life?
3. Do you see a gender element in these accounts? Were the traits that made a nun admirable also appropriate for monks?

The Chinese Empire Re-created: Sui (581–618) and Tang (618–907)

What were the lasting accomplishments of the Sui and Tang Dynasties?

Political division was finally overcome when the Sui Dynasty conquered its rivals to reunify China in 589. Although the dynasty lasted only thirty-seven years, it left a lasting legacy in the form of political reform, the construction of roads and canals, and the institution of written merit-based exams for the appointment of officials. The Tang Dynasty that followed would last for centuries and would build upon the Sui's accomplishments to create an era of impressive cultural creativity and political power.

The Sui Dynasty, 581–618

In the 570s and 580s the long period of division in China was brought to an end under the leadership of the Sui (SWAY) Dynasty. The conquest of the south involved naval as well as land battles, with thousands of ships on both sides contending for control of the Yangzi River. The Sui reasserted Chinese control over northern Vietnam and campaigned into Korea and against the new force on the steppe, the Turks. The Sui strengthened central control of the government by curtailing the power of local officials to appoint their own subordinates and by instituting in 605 C.E. competitive written examinations for the selection of officials.

The crowning achievement of the Sui Dynasty was the construction of the **Grand Canal**, which connected the Yellow and Yangzi River regions. Henceforth the rice-growing Yangzi Valley and south China played an ever more influential role in the country's economic and political life, strengthening China's internal cohesion and facilitating maritime trade with Southeast Asia, India, and areas farther west.

Grand Canal A canal, built during the Sui Dynasty, that connected the Yellow and Yangzi Rivers. It was notable for strengthening China's internal cohesion and economic development.

Despite these accomplishments, the Sui Dynasty lasted for only two reigns. The ambitious projects of the two Sui emperors led to exhaustion and unrest, and in the ensuing warfare Li Yuan, a Chinese from the same northwest aristocratic circles as the founder of the Sui, seized the throne.

The Tang Dynasty, 618–907

The dynasty founded by Li Yuan, the Tang, was one of the high points of traditional Chinese civilization. Especially during this dynasty’s first century, its capital, Chang’an, was the cultural center of East Asia, drawing in merchants, pilgrims, missionaries, and students to a degree never matched before or after. This position of strength gave the Chinese the confidence to be open to learning from the outside world, leading to a more cosmopolitan culture than in any other period before the twentieth century.

Urban Planning Chang’an in Tang times attracted merchants, pilgrims, and students from all over East Asia. The city was laid out on a square grid (left) and divided into walled wards, the gates to which were closed at night. Temples were found throughout the city, but trade was limited to two government-supervised markets. In the eighth and ninth centuries the Japanese copied the general plan of Chang’an in designing their capitals — first at Nara, then at Heian, shown on the right.

The first two Tang rulers, Gaozu (Li Yuan, r. 618–626) and Taizong (tie-dzuhng) (r. 626–649), were able monarchs. Adding to their armies auxiliary troops composed of Turks, Tanguts, Khitans, and other non-Chinese led by their own chieftains, they campaigned into Korea, Vietnam, and Central Asia. In 630 the Chinese turned against their former allies, the Turks, gaining territory from them and winning for Taizong the title of Great Khan.

In the civil sphere the Tang emperors built on the Sui precedent of using written examinations to select officials. Candidates had to master the Confucian classics and the rules of poetry, and they had to be able to analyze practical administrative and political matters. Government schools were founded to prepare the sons of officials and other young men for service as officials.

Tang China, ca. 750 C.E.

The mid-Tang Dynasty saw two women — Empress Wu and Consort Yang Guifei (yahng gway-fay) — rise to positions of great political power. Empress Wu was the consort of the weak and sickly emperor Gaozong. After Gaozong suffered a stroke in 660, she took full charge. She continued to rule after Gaozong's death, summarily deposing her own two sons and dealing harshly with all opponents. In 690 she proclaimed herself emperor, becoming the only woman to take that title in Chinese history. To gain support, she circulated a Buddhist sutra that predicted the imminent reincarnation of the Buddha Maitreya as a female monarch, during whose reign the world would be free of illness, worry, and disaster. Although despised by later Chinese historians as an evil usurper, Empress Wu was an effective leader. It was not until she was over eighty that members of the court were able to force her out in favor of her son.

Her grandson, the emperor Xuanzong (r. 713–756), presided over a brilliant court and patronized leading poets, painters, and calligraphers. In his later years, after he became enamored of his consort Yang Guifei, he did not want to be bothered by the details of government and allowed her to place friends and relatives in important positions in the government.

One of her favorites was the general An Lushan, who rebelled in 755. Xuanzong had to flee the capital, and the troops that accompanied him forced him to have Yang Guifei executed.

The rebellion of An Lushan was devastating to the Tang Dynasty. Peace was restored only by calling on the Uighurs (WEE-gurz), a Turkish people allied with the Tang, who looted the capital after taking it from the rebels. The rebellion was finally suppressed in 763, but Tang strength was never fully re-established. Many military governors came to treat their provinces as hereditary kingdoms. In addition, palace eunuchs gained increasing power at court.

Tang Culture

The reunification of north and south led to cultural flowering. The Tang capital cities of Chang'an and Luoyang became great metropolises. In these cosmopolitan cities, knowledge of the outside world was stimulated by the presence of envoys, merchants, pilgrims, and students who came from neighboring states in Central Asia, Japan, Korea, Tibet, and Southeast Asia. Because of the presence of foreign merchants, many religions were practiced, including Nestorian Christianity, Manichaeism, Zoroastrianism, Judaism, and Islam, although none of them spread into the Chinese population the way Buddhism had a few centuries earlier. Foreign fashions in hair and clothing were often copied, and foreign amusements such as the Persian game of polo found followings among the well-to-do. The introduction of new musical instruments and tunes from India, Iran, and Central Asia brought about a major transformation in Chinese music.

Kyodo News International, Inc.

Five-Stringed Pipa/Biwa This musical instrument, decorated with fine wood marquetry, was probably presented by the Tang court to a Japanese envoy. It was among the objects placed in a Japanese royal storage house (Shōsōin) in 756.

The Tang Dynasty was the great age of Chinese poetry. Skill in composing poetry was tested in the civil service examinations, and educated men had to be able to compose poems at social gatherings. The pain of parting, the joys of nature, and the pleasures of wine and friendship were all common poetic topics. One of Li Bo's (701–762) most famous poems describes an evening of drinking with only the moon and his shadow for company:

> A cup of wine, under the flowering trees;
> I drink alone, for no friend is near.
> Raising my cup I beckon the bright moon,
> For he, with my shadow, will make three men.
> The moon, alas, is no drinker of wine;

In Tang times Buddhism fully penetrated Chinese daily life. Stories of Buddhist origin became widely known, and Buddhist festivals became among the most popular holidays. Buddhist monasteries ran schools for children and in remote areas provided lodging for travelers. Merchants entrusted their money and wares to monasteries for safekeeping, in effect transforming the monasteries into banks and warehouses.

At the intellectual and religious level, Buddhism was developing in distinctly Chinese directions. Two schools that thrived were Pure Land and Chan. **Pure Land** appealed to laypeople because the simple act of calling on the Buddha Amitabha and his chief helper, the compassionate bodhisattva Guanyin, could lead to rebirth in Amitabha’s paradise, the Pure Land. Among the educated elite the **Chan** school (known in Japan as Zen) also gained popularity. Chan teachings rejected the authority of the sutras and claimed the superiority of mind-to-mind transmission of Buddhist truths.

Figurines of a Man and a Woman Mounted on Horses
Tang tombs often contain ceramic figurines of horses or people mounted on horses, including women riding astride.

Opposition to Buddhism re-emerged in the late Tang period. In addition to concerns about the fiscal impact of removing so much land from the tax rolls and so many men from government labor service, there were concerns about Buddhism’s foreign origins. As China’s international position weakened, xenophobia surfaced. During the persecution of 845, more than 4,600 monasteries and 40,000 temples and shrines were destroyed, and more than 260,000 Buddhist monks and nuns were forced to return to secular life. Although this ban was lifted after a few years, the monastic establishment never fully recovered. Buddhism retained a strong hold among laypeople, and basic Buddhist ideas like karma and reincarnation had become fully incorporated into everyday Chinese thinking. But Buddhism was never again as central to Chinese life.

The East Asian Cultural Sphere

What elements of Chinese culture were adopted by Koreans, Vietnamese, and Japanese, and how did they adapt them to their own circumstances?

During the millennium from 200 B.C.E. to 800 C.E., China exerted a powerful influence on its immediate neighbors, who began forming states of their own. By Tang times China was surrounded by independent states in Korea, Manchuria, Tibet, the area that is now Yunnan province, Vietnam, and Japan. All of these states were much smaller than China in area and population, making China by far the dominant force politically and culturally until the nineteenth century. Nevertheless, each of these separate states developed a strong sense of its independent identity.

The earliest information about each of these countries is found in Chinese sources. Han armies brought Chinese culture to Korea and Vietnam, but even in those cases much cultural borrowing was entirely voluntary as the elite, merchants, and craftsmen adopted the techniques, ideas, and practices they found appealing. In Japan much of the process of absorbing elements of Chinese culture was mediated via Korea. In Korea, Japan, and Vietnam the fine arts — painting, architecture, and ceramics in particular — were all strongly influenced by Chinese models. Tibet, though a thorn in the side of Tang China, was as much in the Indian sphere of influence as in the Chinese and thus followed a somewhat different trajectory. Most significantly, it never adopted Chinese characters as its written language, nor was it as influenced by Chinese artistic styles as were other areas. Moreover, the form of Buddhism that became dominant in Tibet came directly from India, not through Central Asia and China.

In each area Chinese-style culture was at first adopted by elites, but in time many Chinese products and ideas, ranging from written language to chopsticks and soy sauce, became incorporated into everyday life. By the eighth century the written Chinese language was used by educated people throughout East Asia. The books that educated people read included the Chinese classics, histories, and poetry, as well as Buddhist sutras translated into Chinese. The great appeal of Buddhism known primarily through Chinese translation was a powerful force promoting cultural borrowing.

Vietnam

Vietnam's climate is much like that of southernmost China — subtropical, with abundant rain and rivers. The Vietnamese first appear in Chinese sources as a people of south China called the Yue, who gradually migrated farther south as the Chinese state expanded. The people of the Red River Valley in northern Vietnam had achieved a relatively advanced level of Bronze Age civilization by the first century B.C.E. The bronze heads of their arrows were often dipped in poison to facilitate killing large animals such as elephants, whose tusks were traded to China for iron. Power was held by hereditary tribal chiefs who served as civil, religious, and military leaders, with the king as the most powerful chief.

The collapse of the Qin Dynasty in 206 B.C.E. had an impact on this area because a former Qin general, finding himself in the far south, set up his own kingdom of Nam Viet. This kingdom covered much of south China and was ruled by the king from his capital near the present site of Guangzhou. Its population consisted chiefly of the Viet people. After killing all officials loyal to the Chinese emperor, the king adopted the customs of the Viet and made himself the ruler of a vast state that extended as far south as modern-day Da Nang.

The Kingdom of Nam Viet, ca. 150 B.C.E.

After almost a hundred years of diplomatic and military duels between the Han Dynasty and the Nam Viet king and his successors, Nam Viet was conquered in 111 B.C.E. by Chinese armies. Chinese administrators were assigned to replace the local nobility. Chinese political institutions were imposed, and Confucianism was treated as the official ideology. The

Chinese language was introduced as the medium of official and literary expression, and Chinese characters were adopted as the written form for the Vietnamese spoken language. The Chinese built roads, waterways, and harbors to facilitate communication within the region and to ensure that they maintained administrative and military control over it.

Chinese innovations that were beneficial to the Vietnamese were readily integrated into the indigenous culture, but the local elite were not reconciled to Chinese political domination. The most famous early revolt took place in 39 C.E., when two widows of local aristocrats, the Trung sisters, led an uprising against foreign rule. After overwhelming Chinese strongholds, they declared themselves queens of an independent Vietnamese kingdom. Three years later a powerful army sent by the Han emperor re-established Chinese rule.

China retained at least nominal control over northern Vietnam through the Tang Dynasty, and there were no real borders between China proper and Vietnam during this time. The local elite became culturally dual, serving as brokers between the Chinese governors and the native people.

Korea

Korea is a mountainous peninsula some 600 miles long extending south from Manchuria and Siberia. At its tip it is about 120 miles from Japan (Map 7.4). Archaeological, linguistic, and anthropological evidence indicates that the Korean people share a common ethnic origin with other peoples of North Asia, including those of Manchuria, Siberia, and Japan. Linguistically, Korean is not related to Chinese.

MAP 7.4 Korea and Japan, ca. 600 C.E. Korea and Japan are of similar latitude, but Korea's climate is more continental, with harsher winters. Of Japan's four islands, Kyushu is closest to Korea and mainland Asia.

Korea began adopting elements of technology from China in the first millennium B.C.E., including bronze and iron technology. Chinese-Korean contact expanded during the Warring States Period, when the state of Yan extended into part of Korea. In about 194 B.C.E. Wiman, an unsuccessful rebel against the Han Dynasty, fled to Korea and set up a state called Choson in what is now northwest Korea and southern Manchuria. In 108 B.C.E. this state was overthrown by Han armies and four prefectures were established there.

The impact of the Chinese prefectures in Korea was similar to that of the contemporaneous Roman colonies in Britain in encouraging the spread of culture and political forms. The Chinese never controlled the entire Korean peninsula, however. The Han commanderies coexisted with the native Korean kingdom of Koguryo, founded in the first century B.C.E.

Chinese sources describe this kingdom as a society of aristocratic tribal warriors who had under them a mass of serfs and slaves, mostly from conquered tribes. After the Chinese colonies were finally overthrown, the kingdoms of Paekche and Silla emerged farther south on the peninsula in the third and fourth centuries C.E., leading to what is called the Three Kingdoms Period (313–668 C.E.). In all three Korean kingdoms Chinese was used as the language of government and learning. Each of the three kingdoms had hereditary kings, but their power was curbed by the existence of very strong hereditary elites.

Buddhism was officially introduced in Koguryo from China in 372 and in the other states not long after. Buddhism connected Korea to societies across Asia. Buddhist monks went back and forth between China and Korea.

When the Sui Dynasty finally reunified China in 589, it tried to establish control of at least a part of Korea. But the Korean kingdoms were much stronger than their predecessors in Han times, and they repeatedly repulsed Chinese attacks. The Tang government then tried allying itself with one state, Silla, to fight the others. Silla and Tang jointly destroyed Paekche in 660 and Koguryo in 668. With its new resources Silla was able to repel Tang efforts to make Korea a colony but agreed to vassal status. The unification under Silla marked the first political unification of Korea.

For the next century Silla embarked on a policy of wholesale borrowing of Chinese culture and institutions. Annual embassies were sent to Chang'an, and large numbers of students studied in China.

Japan

The heart of Japan is four mountainous islands off the coast of Korea (see Map 7.4). Since the land is rugged and lacking in navigable waterways, the Inland Sea, like the Aegean in Greece, was the easiest avenue of communication in early times. Hence the land bordering the Inland Sea — Kyushu, Shikoku, and Honshu — developed as the political and cultural center of early Japan. Geography also blessed Japan with a moat to protect it from external interference — the Korea Strait and the Sea of Japan.

Japan's early development was closely tied to that of the mainland, especially to Korea. Anthropologists have discerned several major waves of immigrants into Japan. People of the Jōmon (joh-mohn) culture, established by about 10,000 B.C.E. after an influx of people from Southeast

Asia, practiced hunting and fishing and fashioned clay pots. New arrivals from northeast Asia brought agriculture and a distinct culture called Yayoi (yah-yoh-ee) (ca. 300 B.C.E.–300 C.E.). During the Han Dynasty, objects of Chinese and Korean manufacture found their way into Japan, an indication that people were traveling back and forth as well. In the third century C.E. Chinese histories begin to report on the land called Wa made up of mountainous islands. It had numerous communities with markets, granaries, tax collection, and class distinctions. The people liked liquor, ate with their fingers, used body paint, and purified themselves by bathing after a funeral.

One of the most distinctive features of early Japan was its female rulers. A Chinese historian of the time wrote:

> The country formerly had a man as ruler. For some seventy or eighty years after that there were disturbances and warfare. Thereupon the people agreed upon a woman for their ruler. Her name was Pimiko [pee-mee-koe]. She occupied herself with magic and sorcery, bewitching the people. Though mature in age, she remained unmarried. She had a younger brother who assisted her in ruling the country. After she became the ruler, there were few who saw her. She had one thousand women as attendants, but only one man. He served her food and drink and acted as a medium of communication….
>
> When Pimiko passed away, a great mound was raised, more than a hundred paces in diameter. Over a hundred male and female attendants followed her to the grave. Then a king was placed on the throne, but the people would not obey him. Assassination and murder followed; more than one thousand were thus slain.
>
> A relative of Pimiko named Iyo, a girl of thirteen, was then made queen and order was restored.[4]

During the fourth through sixth centuries new waves of migrants from Korea brought the language that evolved into Japanese as well as sericulture (silkmaking), bronze swords, crossbows, iron plows, and the Chinese written language. In this period a social order similar to Korea’s emerged, dominated by a warrior aristocracy organized into clans. Clad in helmets and armor, these warriors wielded swords, battle-axes, and often bows, and some rode into battle on horseback. Those vanquished in battle were made slaves. Each clan had its own chieftain, who marshaled clansmen for battle and served as chief priest. By the fifth century the chief of the clan that claimed descent from the sun-goddess, located in the Yamato plain around modern Osaka, had come to occupy the position of monarch. These Yamato rulers established the chief shrine of the sun-goddess near the seacoast, where she could catch the first rays of the rising sun. This native religion was later termed **Shinto**, the Way of the Gods, and it coexisted with Buddhism, formally introduced in 538 C.E.

Shinto The Way of the Gods, Japan’s native religion.

Beginning in the sixth century Prince Shōtoku (show-toe-coo) (574–622) undertook a sweeping reform of the state designed to strengthen Yamato rule by adopting Chinese-style bureaucratic practices (though not the recruitment of officials by examination). In 604 he instituted a ladder of official ranks similar to China’s, admonished the nobility to avoid strife and opposition, and urged adherence to Buddhist precepts. Near his seat of government, Prince Shōtoku built the magnificent Hōryūji (hoe-ryou-jee) Temple and staffed it with monks from Korea. (See “Analyzing the Evidence: Hōryūji Temple,” page 193.) He also opened direct relations with China, sending four missions during the brief Sui Dynasty.

State-building efforts continued through the seventh century and culminated in the establishment in 710 of Japan’s first long-term true city, the capital at **Nara**, north of modern Osaka. Nara, which was modeled on the Tang capital of Chang’an, gave its name to an era that lasted until 794 and was characterized by the avid importation of Chinese ideas and methods. As Buddhism developed a stronghold in Japan, it inspired many trips to China to acquire sources and to study at Chinese monasteries. Chinese and Korean craftsmen were often brought back to Japan, especially to help with the decoration of the many Buddhist temples then under construction. Musical instruments and tunes were imported as well, many originally from Central Asia. Chinese practices were instituted, such as the compilation of histories and law codes, the creation of provinces, and the appointment of governors to collect taxes from them. By 750 some seven thousand men staffed the central government.

Nara Japan’s capital and first true city; it was established in 710 and modeled on the Tang capital of Chang’an.

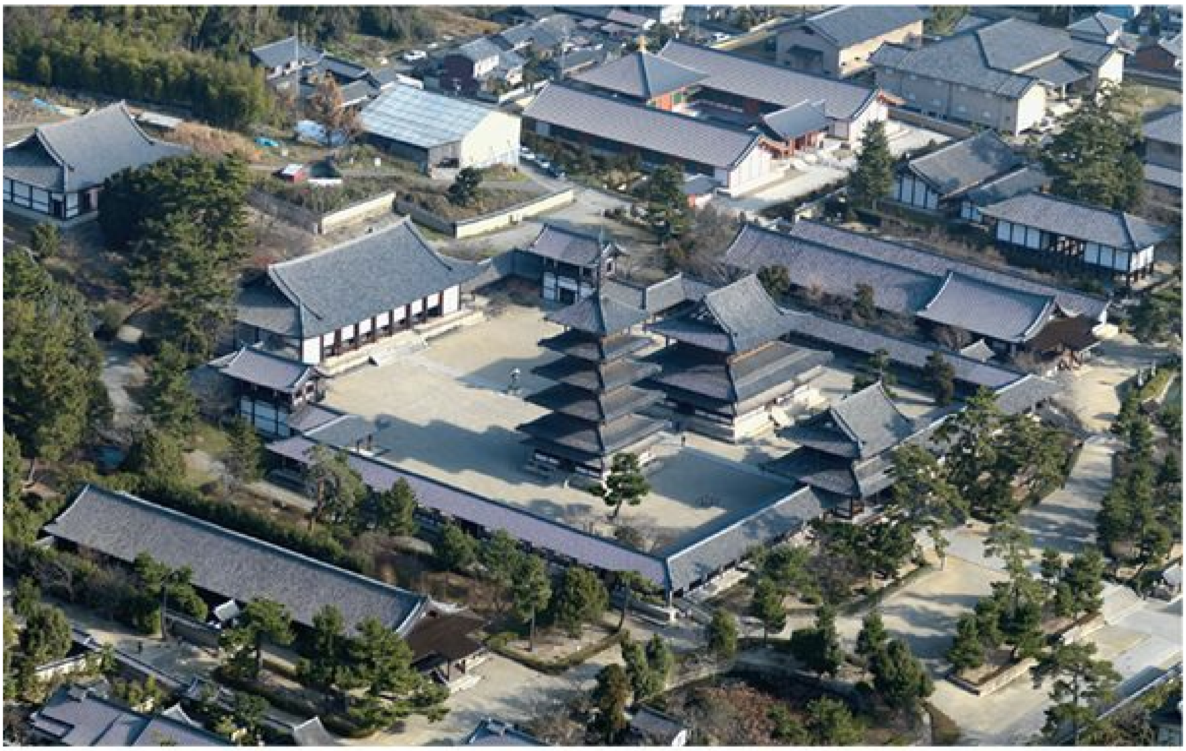
Increased contact with the mainland had unwanted effects as well. In contrast to China and Korea, both part of the Eurasian landmass, Japan had been relatively isolated from many deadly diseases, so when diseases arrived with travelers, people did not have immunity. The great smallpox epidemic of 735–737 is thought to have reduced the population of about 5 million by 30 percent. (See “Global Viewpoints: Coping with Epidemics in Japan and Byzantium,” at right.)

The Buddhist monasteries that ringed Nara were both religious centers and wealthy landlords, and the monks were active in the political life of the capital. Copying the policy of the Tang Dynasty in China, the government ordered every province to establish a Buddhist temple with twenty monks and ten nuns to chant sutras and perform other ceremonies on behalf of the emperor and the state. When an emperor abdicated in 749 in favor of his daughter, he became a Buddhist monk, a practice many of his successors would later follow.

Many of the temples built during the Nara period still stand, the wood, clay, and bronze statues in them exceptionally well preserved. The largest of these temples was the Tōdaiji, with its huge bronze statue of the Buddha, which stood fifty-three feet tall and was made from more than a million pounds of metal. When the temple and statue were completed in 752, an Indian monk painted the eyes. Objects from the dedication ceremony were placed in a special storehouse, and about ten thousand of them are still there, including books, weapons, mirrors, screens, and objects of gold, lacquer, and glass — most made in China but some coming from Central Asia and Persia via the Silk Road.

ANALYZING THE EVIDENCE

Hōryūji Temple



Michael Hitoshi/The Image Bank/Getty Images

Japanese Buddhist temples, like those in China and Korea, consisted of several buildings within a walled compound. The buildings of the Hōryūji Temple (built between 670 and 711, after Prince Shōtoku's original temple burned down) include the oldest wooden structures in the world and house some of the best early Buddhist sculpture in Japan. Craftsmen were sent from Korea to aid in the construction and decoration of the temple, and they brought with them styles that originated in China and India.

The Hōryūji compound is surrounded by a wall lined with covered arcades. Visitors entered through the gate, visible here as a multistory building in the wall on the right. After entering, they saw the five-story pagoda on the left, which is 122 feet tall. It houses what is thought to be a fragment of a bone of the Buddha. To its right is the main hall, built to house the temple's principal images. Originally, these images had included both statues of Buddhas and bodhisattvas and paintings of them on the walls, but a fire in 1949 destroyed the wall paintngs. The statues were preserved, however, and are today classed as national treasures (as are the buildings). Behind the pagoda and main hall is the lecture hall where the monks would assemble for sermons.

The five-story pagoda could be seen from far away, much like the steeples of cathedrals in medieval Europe. Most of the buildings outside this main compound are of later date, and the outer buildings include monks' quarters, libraries, and dining halls.

QUESTIONS FOR ANALYSIS

1. How does this temple complex compare to the great churches of Europe? What are the most significant differences?
2. Was this temple laid out primarily for the convenience of monks who resided there or for lay believers coming to worship? How would their needs differ?
3. What is interesting about the roofs?

GLOBAL VIEWPOINTS

Coping with Epidemics in Japan and Byzantium

Major epidemics struck across Eurasia many times, but Japan was far enough from the mainland to escape most of them. The first text below is an order issued by the Japanese central government to the provincial governments in 737 after the arrival of a devastating epidemic, probably smallpox. The second text is an account from the Byzantine historian Procopius of a deadly plague that hit Constantinople in 542.

Japanese Proclamation of 737

■ One: This infection is called “red swellings.” When it first begins, it is similar to autumnal fevers. Suffering in bed lasts for three or four days in some cases, five or six in others, before the blotches appear. For three or four days as the swellings appear, the limbs and internal organs become hot as if on fire….

Two: Wrap the victim’s abdomen and hips thoroughly in hemp cloth or floss silk. Without fail, keep the patient warm. Never let him become chilled.

Three: When there is no floor, do not lie directly on the earth. Spread a straw mat on the ground and lie down to rest.

Four: We recommend the drinking of rice gruel, either thick or thin, and broth made from boiled rice or millet. But do not eat raw fish or fresh fruits and vegetables. Also do not drink water or suck ice….

Five: In general, people with this illness have no appetite. Force the patient to eat….

Six: For twenty days after the illness passes do not carelessly eat raw fish or fresh fruit or vegetables; do not drink water, take a bath, have sex, force yourself to do anything, or walk in wind and rain. If you overdo it, a relapse will begin immediately….

Seven: In general, if you want to bring this illness under control, do not use pills or powders. If a fever arises, take only a little ginseng boiled in water.

Concerning the above, since the 4th month all in the capital and Kinai have been bedridden with this disease. Many have died. We are also aware that people in the provinces have been afflicted with this distress. So we have written up this set of instructions. Each provincial governor should send it along to his neighbor. When it arrives, make a copy and designate one official at the district office who holds the position of secretary or higher to act as the messenger. The messenger should go quickly to the next place without delaying. The provincial office shall make a tour of its jurisdiction and announce these instructions to the people. If they have no rice for gruel, the province shall make an estimate, grant grain relief from government stores, and report to the Council. When the order arrives, carry it out.

Procopius on the Plague of Justinian

■ [542 C.E.] During these times there was a pestilence, by which the whole human race came near to being annihilated.… In the second year it reached Byzantium in the middle of spring, where it happened that I was staying at that time.…

Those who were attending [the victims] were in a state of constant exhaustion and had a most difficult time of it throughout.… [The patients] had also great difficulty in the matter of eating, for they could not easily take food. And many perished through lack of any man to care for them, for they were either overcome by hunger, or threw themselves down from a height.… Death came in some cases immediately, in others after many days; and with some the body broke out with black pustules about as large as a lentil and these did not survive even one day, but all succumbed immediately. With many also a vomiting of blood ensued without visible cause and straightway brought death.…

And it fell to the lot of the emperor, as was natural, to make provision for the trouble. He therefore detailed soldiers from the palace and distributed money, commanding Theodorus to take charge of this work.… Theodorus, by giving out the emperor’s money and by making further expenditures from his own purse, kept burying the bodies which were not cared for. And when it came about that all the tombs which had existed previously were filled with the dead, then they dug up all the places about the city one after the other, laid the dead there, each one as he could, and departed; but later on those who were making these trenches, no longer able to keep up with the number of the dying, mounted the towers of the fortifications in Sycae, and tearing off the roofs threw the bodies in there in complete disorder; and they piled them up just as each one happened to fall, and filled practically all the towers with corpses, and then covered them again with their roofs.… Indeed in a city which was simply abounding in all good things starvation almost absolute was running riot.

QUESTIONS FOR ANALYSIS

1. The first document is a decree issued during an epidemic, and the second is a narrative looking back on an epidemic that has already run its course. What

differences in these accounts reflect the nature of the documents?

2. What differences in the understanding of disease can you detect in these accounts?
3. What clues do these accounts provide about the identity of the diseases in the epidemics?

Chapter Summary

After unifying China in 221 B.C.E., the Qin Dynasty created a strongly centralized government that did away with noble privilege. The First Emperor standardized script, coinage, weights, and measures. He also built roads, the Great Wall, and a huge tomb for himself. During the four centuries of the subsequent Han Dynasty, the harsher laws of the Qin were lifted, but the strong centralized government was preserved. The Han government promoted internal peace by providing relief in cases of floods, droughts, and famines and by keeping land taxes low for the peasantry. The Han government sent huge armies against the nomadic Xiongnu, whose confederation threatened them in the north, but the Xiongnu remained a potent foe. Still, Han armies expanded Chinese territory in many directions.

For nearly four centuries after the fall of the Han Dynasty, China was divided among contending states. After 316 the north was in the hands of non-Chinese rulers, while the south had Chinese rulers. In this period merchants and missionaries brought Buddhism to China. Many elements of Buddhism were new to China — a huge body of scriptures, celibate monks and nuns, traditions of depicting Buddhas and bodhisattvas in statues and paintings, and a strong proselytizing tradition. Rulers became major patrons in both north and south.

Unlike the Roman Empire, China was successfully reunified in 589 C.E. The short Sui Dynasty was followed by the longer Tang Dynasty. Tang China regained overlordship of the Silk Road cities in Central Asia. The Tang period was one of cultural flowering, with achievements in poetry especially notable. Music was enriched with instruments and tunes from Persia. Tang power declined after 755, when a powerful general turned his army against the government. Although the rebellion was suppressed, the government was not able to regain its strong central control. Moreover, powerful states were formed along Tang's borders. At court, eunuchs gained power at the expense of civil officials.

Over the ten centuries covered in Chapter 7, Korea, Japan, and Vietnam developed distinct cultures while adopting elements of China's material, political, and religious culture, including the Chinese writing system. During the Tang era, ambitious Korean and Japanese rulers sought Chinese expertise and Chinese products, including Chinese-style centralized governments and the Chinese written language.

CONNECTIONS

East Asia was transformed in the millennium between the Qin unification in 221 B.C.E. and the end of the eighth century C.E. The Han Dynasty and four centuries later the Tang Dynasty proved that a centralized, bureaucratic monarchy could bring peace and prosperity to populations of 50 million or more spread across China proper. By 800 C.E. neighboring societies along China's borders, from Korea and Japan on the east to the Uighurs and Tibetans to the west, had followed China's lead, forming states and building cities. Buddhism had transformed the lives of all of these societies, bringing new ways of thinking about life and death and new ways of pursuing spiritual goals.

In the same centuries that Buddhism was adapting to and simultaneously transforming the culture of much of eastern Eurasia, comparable processes were at work in western Eurasia, where Christianity continued to spread. The spread of these religions was aided by increased contact between different cultures, facilitated in Eurasia by the merchants traveling the Silk Road or sailing the Indian Ocean. Where contact between cultures wasn't as extensive, as in Africa (discussed in Chapter 10), religious beliefs were more localized. The collapse of the Roman Empire in the West during this period was not unlike the collapse of the Han Dynasty, but in Europe the empire was never put back together at the level that it was in China, where the Tang Dynasty by many measures was more splendid than the Han. The story of these centuries in western Eurasia is taken up in Chapters 8 and 9, which trace the rise of Christianity and Islam and the movement of peoples throughout Europe and Asia. Before returning to the story of East Asia after 800 in Chapter 13, we will also examine the empires in Africa (Chapter 10) and the Americas (Chapter 11).

A Germanic Ruler

This Germanic ruler appears in an early-ninth-

century collection of laws, made in present-day southern France, which includes portraits of rulers, bishops, and nobles along with legal texts such as the Breviary of Alaric, a Visigothic law code based on Roman law and issued in 506. This ruler is identified here as Lodhanri, king of the Alemanni, a confederation of tribes that fought the Romans and were then conquered by the Franks.

From the third century onward the Western Roman Empire slowly disintegrated, and in 476 the Ostrogothic chieftain Odoacer deposed the Roman emperor in the West and did not take on the title of emperor. This date thus marks the official end of the Roman Empire in the West, although much of the empire had come under the rule of various barbarian tribes well before that. Scholars have long seen this era as one of the great turning points in Western history, but during the last several decades the focus has shifted to continuities as well as changes. What is now usually termed "late antiquity" has been recognized as a period of creativity and adaptation in Europe and western Asia, not simply of decline and fall.

The two main agents of continuity were the Eastern Roman (or Byzantine) Empire and the Christian Church. The Byzantine (BIZ-uhn-teen) Empire lasted until 1453, a thousand years longer than the Western Roman Empire, and it preserved and transmitted much of Greco-Roman law and philosophy. Missionaries and church officials spread Christianity within and far beyond the borders of what had been the Roman Empire, carrying Christian ideas and institutions west to Ireland and east to Central and South Asia. The main agent of change in late antiquity was the migration of barbarian groups throughout much of Europe and western Asia. They brought different social, political, and economic structures with them, but as they encountered Roman and Byzantine culture and became Christian, their own ways of doing things were also transformed.

How did the Byzantine Empire preserve the legacy of Rome?

The Byzantine (or Eastern Roman) Empire (Map 8.1) preserved the forms, institutions, and traditions of the old Roman Empire, and its people even called themselves Romans. Most important, however, is how Byzantium protected the intellectual heritage of Greco-Roman civilization and then passed it on.

MAP 8.1 **The Byzantine and Sassanid Empires, ca. 600** Both the Byzantine and Sassanid Empires included territory that had earlier been part of the Roman Empire. The Sassanid Persians fought Roman armies before the founding of the Byzantine Empire. Later Byzantium and the Sassanids engaged in a series of wars that weakened both and brought neither lasting territorial acquisitions.

Sources of Byzantine Strength

While the western parts of the Roman Empire gradually succumbed to barbarian invaders, the Byzantine Empire survived Germanic, Persian, and Arab attacks. In 540 a force of Xiongnu (whom the Greeks and Romans called Huns) and Bulgars reached the gates of Constantinople. In 583 the Avars, a mounted Mongol people who had swept across Russia and the Balkans, seized Byzantine forts along the Danube and also reached the walls of Constantinople. Between 572 and 630 the Greeks were repeatedly at war with the Sassanid Persians (see "The Sassanid Empire and Conflicts with Byzantium"). Beginning in 632 Muslim forces pressured the Byzantine Empire (see "Islamic States and Their Expansion" in Chapter 9).

Why didn’t one or a combination of these enemies capture Constantinople? The answer lies in strong military leadership and even more in the city’s location and excellent fortifications. During the long reign of the emperor Justinian (r. 527–565), Byzantine generals were able to reconquer much of Italy and North Africa. The Byzantines ruled most of Italy from 535 to 572 and the southern part of the peninsula until the eleventh century. They ruled North Africa until it was conquered by Muslim forces in the late seventh century. Massive triple walls, built by the emperors Constantine and Theodosius II (r. 408–450) and kept in good repair by later emperors, protected Constantinople from sea invasion. Within the walls huge cisterns provided water, and vast gardens and grazing areas supplied food so the defending people could hold out far longer than the besieging army. Attacking Constantinople by land posed greater geographical and logistical problems than a seventh- or eighth-century government could solve. Because the city survived, the empire, though reduced in territory, endured.

The Sassanid Empire and Conflicts with Byzantium

For several centuries the Sassanid empire of Persia was Byzantium’s most regular foe. Ardashir I (r. 224–243), the ruler of a small state and the first of the Sassanid dynasty, conquered the Parthian empire in 226 (see Map 6.2). Ardashir kept expanding his holdings to the east and northwest. Like all empires, the Sassanid depended on agriculture for its economic prosperity, but its location also proved well suited for commerce (see Map 8.1). A lucrative caravan trade linked the Sassanid empire to the Silk Road and China. This trade brought about considerable cultural contact between the Sassanids and the Chinese.

Whereas the Parthians had tolerated many religions, the Sassanid Persians made Zoroastrianism (see “The Religion of Zoroaster” in Chapter 2) the official state religion. The king’s power rested on the support of nobles and Zoroastrian priests who monopolized positions in the court and in the imperial bureaucracy. A highly elaborate court ceremonial and ritual exalted the status of the king and emphasized his semidivine pre-eminence over his subjects. (The Byzantine monarchy, the Roman papacy, and the Muslim caliphate subsequently copied aspects of this Persian ceremonial.) Adherents to religions other than Zoroastrianism, such as Jews and Christians, faced discrimination.

An expansionist foreign policy brought Persia into frequent conflict with Rome and then with Byzantium. Neither side was able to achieve a clear-cut victory until the early seventh century, when the Sassanids advanced all the way to the Mediterranean and even took Egypt in 621.

Their victory would be very short-lived, however, as the taxes required to finance the wars and conflicts over the succession to the throne had weakened the Persians. The Byzantines crushed the Persians in a series of battles ending with one at Nineveh in 627. Just five years later, the first Arabic forces inspired by Islam entered Persian territories, and by 651 the Sassanid dynasty had collapsed (see “Islam’s Spread Beyond Arabia” in Chapter 9).

Justinian’s Code of Law

Byzantine emperors organized and preserved Roman law, making a lasting contribution to the medieval and modern worlds. By the fourth century Roman law had become a huge, bewildering mass. Its sheer bulk made it almost unusable. The emperor Justinian appointed a committee of eminent jurists to sort through and organize the laws. The result was the *Corpus Juris Civilis* (Body of Civil Law), a multipart collection of laws and legal commentary issued from 529 to 534 that is often simply termed **Justinian’s Code** and formed the backbone of Byzantine jurisprudence from that point on. (See “Thinking Like a Historian: Slavery in Roman and Germanic Society,” page 204.)

Justinian’s Code Multipart collection of laws and legal commentary issued in the sixth century by the emperor Justinian.

Like so much of classical culture, Justinian’s Code was lost in western Europe with the end of the Roman Empire, but it was rediscovered in the eleventh century and came to form the foundation of law for nearly every modern European nation.

THINKING LIKE A HISTORIAN

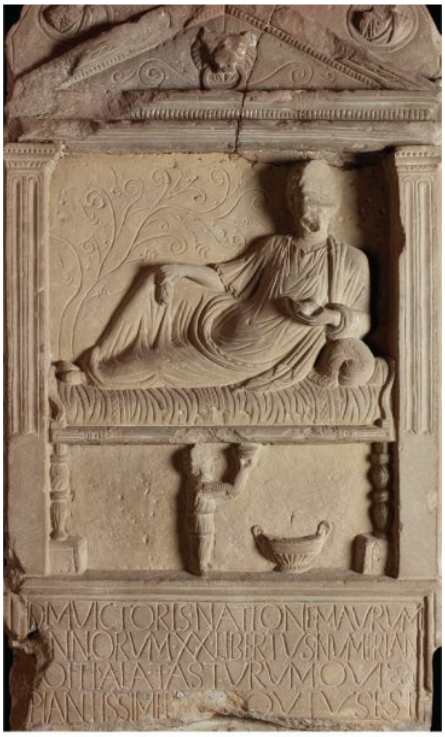
Slavery in Roman and Germanic Society

Slavery continued to be a common condition in the late Roman Empire, and the Germanic tribes were also slave-owning cultures. In both societies, slavery was based not on racial distinctions, but on one's personal status as free or unfree, which was increasingly regulated by law. How could a person cross the border between slave and free in these two societies, and what larger social values do laws regarding slavery reflect?

1 **Theodosian Code, 435–438.** Under Emperor Theodosius II (r. 408–450), imperial decrees issued since the time of Constantine that were still in effect were brought together in a single law code.

■ If a father, forced by need, shall sell any freeborn child whatsoever, the child cannot remain in perpetual slavery, but if he has made compensation by his slavery, he shall be restored to his freeborn status without the repayment of the purchase price…. It is established that children born from the womb of a slave woman are slaves, according to the law…. We have subjected the Scyrae, a barbarian nation, to Our power. Therefore We grant to all persons the opportunity to supply their own fields with men of the aforesaid race…. If any person should take up a boy or girl child that has been cast out of its home with the knowledge and consent of its father or owner, and if he should rear this child to strength with his own sustenance, he shall have the right to keep the said child under the same status as he wished it to have when he took charge of it, that is, as his child or as a slave, whichever he should prefer…. We exhort slaves, that as soon as possible they shall offer themselves for the labors of war, and if they receive their arms as men fit for military service, they shall obtain the reward of freedom…. [In the case of deserters] if the slave should surrender such a deserter, he shall be given his freedom.

2 **Roman tombstone.** The tombstone at right shows a man reclining on a couch, being served a drink by a small slave boy. The inscription identifies the man as a twenty-year-old soldier and freed slave, and it gives his name simply as Victor, with no family name or patronymic.



Arbeia Roman Fort, South Shields, UK/© Tyne & Wear Archives & Museums/Bridgeman Images)

3 **Justinian's Code, 529–534.** The law code of Emperor Justinian includes many provisions regarding slaves.

■ Liberty is the natural power of doing whatever anyone wishes to do unless he is prevented in some way, by force or by law. Slavery is an institution of the Law of Nations by means of which anyone may subject one man to the control of another, contrary to nature. Slaves are so called for the reason that military commanders were accustomed to sell their captives, and in this manner to preserve them, instead of putting them to death…. Slaves are brought under our ownership either by the Civil Law or by that of Nations. This is done by the Civil Law where anyone who is over twenty years of age permits himself to be sold for the sake of sharing in his own price [that is, for debt]. Slaves become our property by the Law of Nations when they are either taken from the enemy, or are born of our female slaves…. Where a fugitive slave betakes himself to the arena [as a gladiator], he cannot escape the power of his master by exposing himself to this danger, which is only that of the risk of death; such a slave must, by all means, be restored to his master, either before or after the combat with wild beasts.

4 **The Burgundian Code, ca. 500.** King Gundobad (r. 474–516), who ruled the Burgundian kingdom in what is now southeastern France, drew up one of the earliest Germanic law codes for his subjects.

■ If anyone shall buy another's slave from the Franks [with whom the

Burgundians were at war], let him prove with suitable witnesses how much and what sort of price he paid and when the witnesses have been sworn in, they shall make oath in the following manner, “We saw him pay the price in our presence, and he who purchased the slave did not do so through any fraud or connivance with the enemy.” … If anyone wishes to manumit a slave, he may do so by giving him his liberty through a legally competent document; or if anyone wishes to give freedom to a bondservant without a written document, let the manumission thus be conferred with the witness of not less than five or seven native freemen.

5 **Lombard laws, 643–735.** The Lombards invaded Italy in 568, conquered Germanic tribes that were already there, and established a kingdom that lasted until 774. Various Lombard kings issued laws on many topics.

■ In the case of a natural son who is born to another man’s woman slave, if the father purchases him and gives him his freedom by the formal procedure he shall remain free. But if the father does not free him, the natural son shall be a slave to him to whom the mother slave belongs…. He who renders false testimony against anyone else, or sets his hand knowingly to a false charter, and this fraud becomes evident, shall pay restitution, half to the king and half to him whose case it is. If the guilty party does not have enough to pay restitution, a public official ought to hand him over as a slave to him who was injured, and he [the offender] shall serve him as a slave…. If a man who is prodigal and ruined, or who has sold or dissipated his substance, or for other reasons does not have that with which to pay restitution, commits theft or adultery or a breach of the peace, or injures another man and the restitution for this is twenty solidi or more, then a public representative ought to hand him over as a slave to the man who committed such illegal acts…. If a freeman has a man and woman slave, or freedman and freedwoman, who are married, and inspired by hatred of the human race, he has intercourse with that woman whose husband is the slave or with the freedwoman whose husband is the freedman, he has committed adultery and we decree that he shall lose that slave or freedman with whose wife he committed adultery and the woman as well, for it is not pleasing to God that any man should have intercourse with the wife of another.

6 **Laws of the Anglo-Saxon kings, early tenth century**. The Anglo-Saxon rulers in England issued law codes; this law is from the code of Edward the Elder (r. 899–925), king of Wessex and Mercia.

■ If a man, through [being found guilty of] an accusation of stealing, forfeits his freedom and gives up his person to his lord, and his kinsmen forsake him, and he knows no one who will make legal amends for him, he shall do such servile labour as may be required and his kinsmen shall have no right to his wergeld [if he is slain].

ANALYZING THE EVIDENCE

1. According to the Roman laws (Sources 1 and 3), how could a person become a slave in Roman society? According to the Germanic laws (Sources 4–6), how could this happen in Germanic society? Which of these methods established more permanent conditions of servitude?
2. How could a slave become free in Roman society? In Germanic?
3. How might the man in the tombstone (Source 2) have obtained his freedom?
4. According to Justinian's Code (Source 3), is slavery natural? What types of laws establish it, and how do these laws reflect Roman notions of law?
5. In Germanic society, the kin group was responsible for the actions of its members. How do the laws in Sources 4–6 reflect this principle? From Sources 1–3 and your reading in this and earlier chapters, how did family and kin shape slavery in Roman society?

PUTTING IT ALL TOGETHER

Using the sources above, along with what you have learned in class and in Chapters 6 and 8, write a short essay that analyzes ways in which the boundary between slave and free was established, protected, and traversed in Roman and Germanic society. How could a person cross the border between slave and free in these two societies, and what larger social values do laws regarding slavery reflect? How did the laws regarding slavery differ in Roman and Germanic society, and how were they similar?

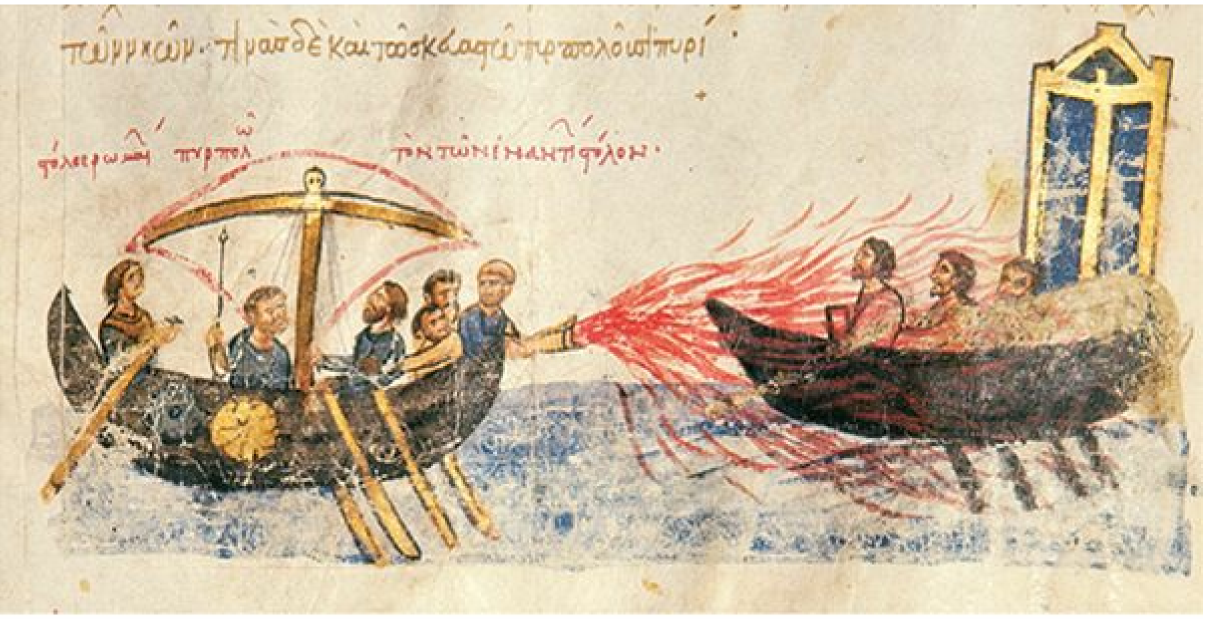
Byzantine Intellectual Life

Just as they valued the law, the Byzantines prized education. As a result, many masterpieces of ancient Greek literature survived to influence the intellectual life of the modern world. Among members of the large reading public, history was a favorite subject. The most remarkable Byzantine historian was Procopius (ca. 500–ca. 562), who wrote the *Secret History*, a vicious and uproarious attack on Justinian and his wife, the empress Theodora. (See “Individuals in Society: Theodora of Constantinople,” at right.)



Museo del Prado, Madrid, Spain/Bridgeman Images

Greek Fire In this illustration from a twelfth-century manuscript, sailors shoot Greek fire toward an attacking ship from a pressurized tube that looks strikingly similar to a modern flamethrower. The exact formula for Greek fire has been lost, but it was probably made from a petroleum product because it continued burning on water. Greek fire was particularly important in Byzantine defenses of Constantinople from Muslim forces in the late seventh century.

Although the Byzantines discovered little that was new in mathematics and geometry, they made advances in military applications. For example, they invented an explosive liquid that came to be known as “Greek fire.” The liquid was heated and propelled by a pump through a bronze tube, and as the jet left the tube, it was ignited — somewhat like a modern flamethrower.

The Byzantines devoted a great deal of attention to medicine, and their general level of medical competence was far higher than that of western Europeans. Yet their physicians could not cope with the terrible disease, often called “the Justinian plague,” that swept through the Byzantine Empire and parts of western Europe between 542 and 560. In 2013 scientists studying ancient teeth confirmed that this disease was bubonic plague caused by the bacillus *Yersinia pestis*, probably originating in northwestern India and carried to the Mediterranean region by ships. The epidemic had profound political as well as social consequences. It weakened Justinian’s military resources, thus hampering his efforts to restore unity to the Mediterranean world.

INDIVIDUALS IN SOCIETY

Theodora of Constantinople

A sixth-century mosaic of the empress Theodora, made of thousands of tiny cubes of glass, shows her with a halo — a symbol of power — and surrounded by officials, priests, and court ladies. (San Vitale, Ravenna, Italy/Bridgeman Images)

THE MOST POWERFUL WOMAN IN BYZANTINE HISTORY was the daughter of a bear trainer for the circus. Theodora (ca. 497–548) grew up in what her contemporaries regarded as an undignified and morally suspect atmosphere, and she worked as a dancer and actress, both dishonorable occupations in the Roman world. Despite her background, she caught the eye of Justinian, who was then a military leader and whose uncle (and adoptive father) Justin had himself risen from obscurity to become the ruler of the Byzantine Empire. Under Justinian's influence, Justin changed the law to allow an actress who had left her disreputable life to marry whom she liked, and Justinian and Theodora married in 525. When Justinian was proclaimed co-emperor with his uncle Justin on April 1, 527, Theodora received the rare title of *augusta*, empress. Thereafter her name was linked with Justinian's in the exercise of imperial power.

Most of our knowledge of Theodora's early life comes from the

Secret History, a tell-all description of the vices of Justinian and his court written by Procopius around 550. Procopius was the official court historian and thus spent his days praising those same people. In the *Secret History*, however, he portrays Theodora and Justinian as demonic, greedy, and vicious, killing courtiers to steal their property. In scene after detailed scene, Procopius portrays Theodora as particularly evil, sexually insatiable, and cruel, a temptress who used sorcery to attract men, including the hapless Justinian.

In one of his official histories, *The History of the Wars of Justinian*, Procopius presents a very different Theodora. Riots between the supporters of two teams in chariot races had turned deadly, and Justinian wavered in his handling of the perpetrators. Both sides turned against the emperor, besieging the palace while Justinian was inside it. Shouting "*Nika*!" (Victory), the rioters swept through the city, burning and looting. Justinian's counselors urged flight, but, according to Procopius, Theodora rose and declared:

> For one who has reigned, it is intolerable to be an exile…. If you wish, O Emperor, to save yourself, there is no difficulty: we have ample funds and there are the ships. Yet reflect whether, when you have once escaped to a place of security, you will not prefer death to safety. I agree with an old saying that the purple [that is, the color worn only by emperors] is a fair winding sheet [to be buried in].

Justinian rallied, ordered more than thirty thousand men and women executed, and crushed the revolt.

Other sources describe or suggest Theodora's influence on imperial policy. Justinian passed a number of laws that improved the legal status of women, such as allowing women to own property and to be guardians over their own children. He forbade the exposure of unwanted infants, which happened more often to girls than to boys because boys were valued more highly. Theodora presided at imperial receptions for Arab sheiks, Persian ambassadors, Germanic princesses from the West, and barbarian chieftains from southern Russia. When Justinian fell ill from the bubonic plague in 542, Theodora took over his duties. Justinian is reputed to have consulted her every day about all aspects of state policy, including religious policy regarding the doctrinal disputes that continued throughout his reign.

Theodora's influence over her husband and her power in the Byzantine state continued until she died, perhaps of cancer, twenty years before Justinian. Her influence may have even continued after death, for Justinian continued to pass reforms favoring women and, at the end of his life, accepted an interpretation of Christian doctrine she had favored. Institutions that she established, including hospitals and churches, continued to be reminders of her charity and piety.

Theodora has been viewed as a symbol of the use of beauty and cleverness to attain position and power, and also as a strong and capable co-ruler who held the empire together during riots, revolts, and deadly epidemics. Just as she fascinated Procopius, she continues to intrigue writers today, who make her a character not only in historical works, but also in science fiction and fantasy.

QUESTIONS FOR ANALYSIS

1. How would you assess the complex legacy of Theodora?
2. Since Procopius's public and private views of the empress are so different, should he be trusted at all as a historical source? Why or why not?

Life in Constantinople

By the seventh century Constantinople was the greatest city in the Christian world: a large population center, the seat of the imperial court and administration, and the pivot of a large volume of international trade. Given that the city was a natural geographical connecting point between East and West, its markets offered goods from many parts of the world. Furs and timber flowed across the Black Sea from the Rus (Russia) to the capital, as did slaves across the Mediterranean from northern Europe and the Balkans via Venice. Spices, silks, jewelry, and other luxury goods came to Constantinople from India and China by way of Arabia, the Red Sea, and the Indian Ocean. In return, the city exported glassware, mosaics, gold coins, silk cloth, carpets, and a host of other products, with much foreign trade in the hands of Italian merchants. At the end of the eleventh century Constantinople may have been the world's third-largest city, with only Córdoba in Spain and Kaifeng in China larger.

Constantinople did not enjoy constant political stability. Between the accession of Emperor Heraclius in 610 and the fall of the city to Western Crusaders in 1204 (see "The Crusades" in Chapter 14), four separate dynasties ruled at Constantinople. Imperial government involved such intricate court intrigue, assassination plots, and military revolts that the word *byzantine* is sometimes used in English to mean extremely entangled and complicated politics.

The typical household in the city included family members and servants, some of whom were slaves. Artisans lived and worked in their shops, while clerks, civil servants, minor officials, and business people commonly dwelled in multistory buildings perhaps comparable to the apartment complexes of modern American cities. Wealthy aristocrats resided in freestanding mansions that frequently included interior courts, galleries, large reception halls, small sleeping rooms, reading and writing rooms, baths, and chapels.

In the homes of the upper classes, the segregation of women seems to have been the first principle of interior design. As in ancient Athens, private houses contained a *gynaeceum* (guy-neh-KEE-uhm), or women's apartment, where women were kept strictly separated from the outside world. The fundamental reason for this segregation was the family's honor.

As it was throughout the world, marriage was part of a family's strategy for social advancement. Both the immediate family and the larger kinship group participated in the selection of a bride or a groom, choosing a spouse who might enhance the family's wealth or prestige.

The Growth of the Christian Church

How did the Christian Church become a major force in Europe?

As the Western Roman Empire disintegrated, the Christian Church survived and grew, becoming the most important institution in Europe. The administrators of the church developed permanent institutions that drew on the Greco-Roman tradition but also expressed Christian values.

The Evolution of Church Leadership and Orthodoxy

Believers in early Christian communities chose their own leaders, but over time appointment by existing church leaders or secular rulers became the common practice. During the reign of Diocletian (die-oh-KLEE-shun) (r. 284–305), the Roman Empire had been divided for administrative purposes into geographical units called **dioceses**, and Christianity adopted this pattern. Each diocese was headed by a bishop, who was responsible for organizing preaching, overseeing the community’s goods, maintaining orthodox (established or correct) doctrine, and delegating responsibilities for preaching and teaching. The center of a bishop’s authority was his cathedral, a word deriving from the Latin *cathedra*, meaning “chair.”

dioceses Geographic administrative districts of the church, each under the authority of a bishop and centered on a cathedral.

The early Christian Church benefited from the administrative abilities of church leaders. Bishop Ambrose of Milan (339–397) was typical of the Roman aristocrats who held high public office, converted to Christianity, and subsequently became bishops. Like many bishops, Ambrose had a solid education in classical law and rhetoric, which he used to become an eloquent preacher. He had a strong sense of his authority and even successfully resisted Emperor Theodosius’s (r. 379–395) efforts to take control of church property. Ambrose’s assertion that the church was supreme in spiritual matters and the state in secular issues was to serve as the cornerstone of the church’s position on church-state relations for centuries. Because of his strong influence, Ambrose came to be regarded as one of the “fathers of the church,” that is, early Christian thinkers whose authority was regarded as second only to the Bible in later centuries.

Saint Jerome and Saint Ambrose This wood carving shows Saint Ambrose and Saint Jerome, two of the most important early church fathers, hard at work writing. Divine inspiration appears in the form of an angel and a dove. (Duomo, Modena, Italy/Alinari/Art Resource, NY)

Although conflicts between religious and secular leaders were frequent, the church also received support from the emperors. In 380 Theodosius made Christianity the official religion of the empire, and later in his reign he authorized the closure or destruction of temples and holy sites dedicated to the traditional Roman and Greek gods. In return for such support, the emperors expected the Christian Church's assistance in maintaining order and unity.

Christians disagreed with one another about many issues. In the fourth and fifth centuries disputes arose over the nature of Christ. For example, Arianism, developed by Arius (ca. 250–336), a priest of Alexandria, held that Jesus was created by the will of God the Father and thus was not co-eternal with him. Emperor Constantine, who legalized Christianity in 312, rejected the Arian interpretation. In 325 he summoned a council of church leaders to Nicaea (nigh-SEE-uh) in Asia Minor and presided over it personally. The council produced the Nicene (nigh-SEEN) Creed, which defined the position that Christ is "eternally begotten of the Father" and of the same substance as the Father. Arius and those who refused to accept Nicene Christianity were banished. Their interpretation of the nature of Christ was declared a **heresy**, that is, a belief that contradicted the interpretation the church leaders declared was correct, which was termed orthodoxy. These actions did not end Arianism, however. Several later emperors were Arian Christian, and Arian missionaries converted many barbarian tribes, who were attracted by the idea that Jesus was God's second-in-command, which fit well with their own warrior hierarchies and was less complicated than the idea of two persons with one substance. The Nicene interpretation eventually became the most widely held understanding of the nature of Christ, however, and is accepted today by the Roman Catholic Church, the Eastern Orthodox Churches, and most Protestant Churches.

heresy A religious practice or belief judged unacceptable by church officials.

The Nicene Creed says little specifically about the Holy Spirit, but in the following centuries the idea that the Father, Son, and Holy Spirit are "one substance in three persons" — the Trinity — became a central doctrine in Christianity, though again there were those who disagreed. Disputes about the nature of Christ also continued, with factions establishing themselves as separate Christian groups. The Nestorians, for example, regarded the divine and human natures in Jesus as distinct from one another, whereas the orthodox opinion was that they were united. The Nestorians split from the rest of the church in the fifth century after their position was outlawed and settled in Persia. Nestorian Christian missionaries later founded churches in Central Asia, India, and China.

The Western Church and the Eastern Church

The leader of the church in the West, the bishop of Rome, became more powerful than his counterpart in the Byzantine East for a variety of reasons. Most significantly, bishops of Rome asserted that Rome had a special place in Christian history. According to tradition, Saint Peter, chief of Jesus’s disciples, had lived in Rome and been its first bishop. Thus, as successors of Peter, the bishops of Rome — known as **popes** — claimed a privileged position in the church hierarchy, an idea called the Petrine Doctrine. They urged other churches to appeal to Rome for the resolution of disputed issues and sent letters of guidance to other bishops. (The Christian Church headed by the pope in Rome was generally called the Roman Church in this era, and later the Roman Catholic Church.)

popes Heads of the Roman Catholic Church, who became political as well as religious authorities. The period of a pope’s term in office is called a pontificate.

The popes also expanded the church’s secular authority. They made treaties with barbarian leaders, charged taxes, enforced laws, and organized armies. The Western Christian Church headed by the pope in Rome would become the most enduring nongovernmental institution in world history.

By contrast, in the East the emperor’s jurisdiction over the church was fully acknowledged. As in Rome, there was a head of the church in Constantinople, called the patriarch, but he did not develop the same powers that the pope did in the West because there was never a similar power vacuum into which he needed to step. He and other high church officials were appointed by the emperor. The Eastern emperors looked on religion as a branch of the state, and they considered it their duty to protect the faith not only against heathen outsiders but also against heretics within the empire. Following the pattern set by Constantine, the emperors summoned councils of bishops and theologians to settle doctrinal disputes. They and the Eastern bishops did not accept Rome’s claim to primacy, and gradually the Byzantine Christian Church, generally called the **Orthodox Church**, and the Roman Church began to diverge. In addition, other branches of Christianity in the East, including the Nestorians, Maronites, and Copts, developed their own distinctive theological ideas and patterns of organization, which have continued to today.

Orthodox Church Another name for the Eastern Christian Church, over which emperors continued to have power.

Christian Monasticism

Christianity began and spread as a city religion. With time, however, some especially pious Christians started to feel that a life of asceticism (extreme material sacrifice, including fasting and the renunciation of sex) was a better way to show their devotion to Christ’s teachings, just as followers of Mahavira or the Buddha had centuries earlier in South Asia (see “India’s Great Religions” in Chapter 3).

Ascetics often separate themselves from their families and normal social life, and this is what Christian ascetics did. Individuals and small groups withdrew from cities and moved to the Egyptian desert, where they sought God through prayer in caves and shelters in the desert or mountains. These individuals were called hermits or monks. Gradually, large groups of monks emerged in the deserts of Upper Egypt, creating a style of life known as monasticism. Many devout women were also attracted to this type of monasticism, becoming nuns. Although monks and nuns led isolated lives, ordinary people soon recognized them as holy people and sought them as spiritual guides.

Floor Plan and Foundation of Kursi Monastery Church Built on the eastern shore of the Sea of Galilee in the fifth century at a major pilgrimage site, this walled monastery had living quarters for the monks, a guesthouse, and a bath for pilgrims. It contained a church modeled on the type of Roman public building known as a basilica, with an open courtyard with two wells (at the bottom in the pictures), mosaic floors, and a central nave separated from side aisles by rows of arched columns. In one side chapel (on the left in the pictures) was a small baptismal font, and in another a press for olive oil, a major source of income for the monastery. The skeletons of thirty monks were found in a crypt when the site was uncovered during road construction in 1970.

Church leaders did not really approve of the solitary life. Hermits sometimes claimed to have mystical experiences — direct communications with God. If hermits could communicate directly with the Lord, what need had they for priests, bishops, and the institutional church? The church hierarchy instead encouraged those who wanted to live ascetic lives of devotion to do so in communities. Consequently, in the fourth, fifth, and sixth centuries many different kinds of communal monasticism developed in Gaul, Italy, Spain, Anglo-Saxon England, and Ireland.

In 529 Benedict of Nursia (ca. 480–547) wrote a brief set of regulations for the monks who had gathered around him at Monte Cassino, between Rome and Naples. Benedict’s guide for monastic life, known as *The Rule of Saint Benedict*, slowly replaced all others, and it has influenced all forms of organized religious life in the Roman Church. The guide outlined a monastic life of regularity, discipline, and moderation in an atmosphere of silence. Under Benedict’s regulations, monks spent part of each day in formal prayer, chanting psalms and other prayers from the Bible. The rest of the day was passed in manual labor, study, and private prayer. The monastic life as conceived by Saint Benedict provided opportunities for men of different abilities and talents — from mechanics to gardeners to literary scholars. The Benedictine form of religious life also appealed to women, because it allowed them to show their devotion and engage in study. Benedict’s twin sister, Scholastica (480–543), adapted the *Rule* for use by her community of nuns.

Benedictine monasticism also succeeded partly because it was so materially successful. In the seventh and eighth centuries Benedictine monasteries pushed back forests and wastelands, drained swamps, and experimented with crop rotation, making a significant contribution to the agricultural development of Europe. Monasteries also conducted schools for local young people. Some learned about prescriptions and herbal remedies and went on to provide medical treatment for their localities. Others copied manuscripts and wrote books. Local and royal governments drew on the services of the literate men and able administrators the monasteries produced.

Because all monasteries followed rules, men who lived a communal monastic life came to be called regular clergy, from the Latin word *regulus* (rule). In contrast, priests and bishops who staffed churches in which people worshipped and who were not cut off from the world were called secular clergy. According to official church doctrine, women were not members of the clergy, but this distinction was not clear to most people, who thought of nuns as members of the clergy.

Monasticism in the Orthodox world differed in fundamental ways from the monasticism that evolved in western Europe. First, while *The Rule of Saint Benedict* gradually became the universal guide for all western European monasteries, each monastic house in the Byzantine world developed its own set of rules for organization and behavior. Second, education never became a central feature of the Orthodox houses. Since bishops and patriarchs of the Orthodox Church were recruited only from the monasteries, however, these institutions did exercise cultural influence.

Christian Ideas and Practices

How did Christian thinkers adapt classical ideas to Christian teachings, and what new religious concepts and practices did they develop?

The growth of Christianity was tied not just to institutions such as the papacy and monasteries but also to ideas. Initially, Christians rejected Greco-Roman culture. Gradually, however, Christian leaders and thinkers developed ideas that drew on classical influences, though there were also areas of controversy that differed in the Western and Eastern Churches.

Christianity and Classical Culture

In the first century Christians believed that Christ would soon fulfill his promise to return and that the end of the world was near; therefore, they saw no point in devoting time to learning. By the second century, however, these apocalyptic expectations were diminishing, and church leaders began to incorporate elements of Greek and Roman philosophy and learning into Christian teachings (see “The Growing Acceptance and Evolution of Christianity” in Chapter 6). They found support for this incorporation in the written texts that circulated among Christians. In the third and fourth centuries these texts were brought together as the New Testament of the Bible, with general agreement about most of what should be included but sharp disputes about some books. Although some of Jesus’s sermons as recorded in the Gospels (see “The Life and Teachings of Jesus” in Chapter 6) urged followers to avoid worldly attachments, other parts of the Bible advocated acceptance of existing social, economic, and political structures. Christian thinkers built on these, adapting Christian teachings to fit with Roman realities and Roman ideas to fit with Christian aims, just as Buddhist thinkers adapted Buddhist teachings when they spread them to Central Asia, China, Korea, and Japan (see “The Spread of Buddhism Out of India” in Chapter 7).

Saint Jerome (340–419), a theologian and linguist regarded as a father of the church, translated the Old Testament and New Testament from Hebrew and Greek, respectively, into vernacular Latin. Called the Vulgate, his edition of the Bible served as the official translation until the sixteenth century. Familiar with the writings of classical authors such as Cicero and Virgil, Saint Jerome believed that Christians should study the best of ancient thought because it would direct their minds to God. He maintained that the best ancient literature should be interpreted in light of the Christian faith.

Christian attitudes toward gender and sexuality provide a good example of the ways early Christians first challenged and then largely adopted the views of their contemporary world. In his plan of salvation Jesus considered women the equal of men. Women were among the earliest converts to Christianity and took an active role in its spread, preaching, acting as missionaries, being martyred alongside men, and perhaps even baptizing believers. Some women embraced the ideal of virginity and either singly or in monastic communities declared themselves "virgins in the service of Christ." All this initially made Christianity seem dangerous to many Romans who viewed marriage as the foundation of society and the proper patriarchal order.

Not all Christian teachings about gender were radical, however. In the first century male church leaders began to place restrictions on female believers. Women were forbidden to preach and were gradually excluded from holding official positions in Christianity other than in women's monasteries. In so limiting the activities of female believers, Christianity was following well-established social patterns, just as it modeled its official hierarchy after that of the Roman Empire.

Christian teachings about sexuality also built on and challenged classical models. The rejection of sexual activity involved an affirmation of the importance of a spiritual life, but it also incorporated hostility toward the body found in some Hellenistic philosophies. Just as spirit was superior to matter, the thinking went, the mind was superior to the body. Though Christian teachings affirmed that God had created the material world and sanctioned marriage, most Christian thinkers also taught that celibacy was the better life and that anything that distracted one's attention from the spiritual world performed an evil function. For most clerical writers (who were themselves male), this temptation came from women, and in some of their writings women themselves are portrayed as evil, the "devil's gateway." Thus the writings of many church fathers contain a strong streak of misogyny (hatred of women), which was passed down to later Christian thinkers.

The Marys at Jesus's Tomb This late-fourth-century ivory panel tells the biblical story of Mary Magdalene and another Mary who went to Jesus's tomb to anoint the body (Matthew 28:1–7). At the top guards collapse when an angel descends from Heaven, and at the bottom the Marys listen to the angel telling them that Jesus has risen. Here the artist uses Roman artistic styles to convey Christian subject matter, synthesizing classical form and Christian teaching.

Saint Augustine on Sin, Grace, and Redemption

One thinker had an especially strong role in shaping Christian views about sexual activity and many other issues: Saint Augustine of Hippo (354–430). Augustine was born into an urban family in what is now Algeria in

North Africa. His father was a pagan; his mother, Monica, was a devout Christian. He gained an excellent education, fathered a son, and experimented with various religious ideas. In adulthood he converted to his mother's religion, eventually becoming bishop of the city of Hippo Regius.

Augustine's autobiography, *The Confessions*, is a literary masterpiece and one of the most influential books in Western history. Written in the rhetorical style and language of late Roman antiquity, it marks a synthesis of Greco-Roman forms and Christian thought. *The Confessions* describes Augustine's moral struggle, the conflict between his spiritual aspirations and his sensual self. Many Greek and Roman philosophers had taught that knowledge would lead to virtue. Augustine came to reject this idea, claiming that people do not always act on the basis of rational knowledge. Instead the basic or dynamic force in any individual is the will. When Adam ate the fruit forbidden by God in the Garden of Eden (Genesis 3:6), he committed the "original sin" and corrupted the will, wrote Augustine. Adam's sin did not simply remain his own but was passed on to all later humans through sexual intercourse; even infants were tainted. Original sin thus became a common social stain, in Augustine's opinion, transmitted by sexual desire. By viewing sexual desire as the result of Adam and Eve's disobedience to divine instructions, Augustine linked sexuality even more clearly with sin than had earlier church fathers. According to Augustine, because Adam disobeyed God, all human beings have an innate tendency to sin: their will is weak. But Augustine held that God restores the strength of the will through grace, which is transmitted in certain rituals that the church defined as **sacraments**, such as baptism. Augustine's ideas on sin, grace, and redemption became the foundation of all subsequent Western Christian theology, Protestant as well as Catholic.

sacraments Certain rituals of the church believed to act as a conduit of God's grace, such as baptism.

The Iconoclastic Controversy

Augustine's ideas about original sin did not become important in the Eastern Orthodox Church, where other issues seemed more significant. In the centuries after Constantine, the most serious dispute within the Orthodox Church concerned icons — images or representations of God the Father, Jesus, and the saints in painting, bas-relief, or mosaic. (See "Analyzing the Evidence: Orthodox Icon of Jesus," page 214.) Icons were important tools in conversion and in people’s devotional lives, but some church leaders and emperors came to feel that the veneration of images had gone too far.

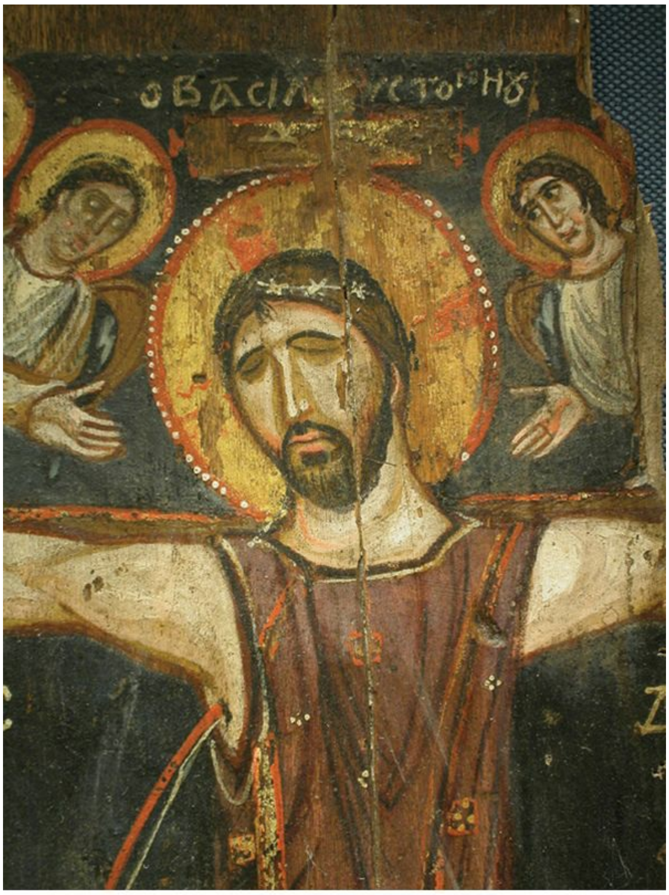
The result of this dispute was a terrible theological conflict, the **iconoclastic controversy**, that split the Byzantine world for a century. In 730 the emperor Leo III (r. 717–741) ordered the destruction of icons. The removal of these images from Byzantine churches provoked a violent reaction: entire provinces revolted, and the Byzantine Empire and the Roman papacy severed relations. Since Eastern monasteries were the fiercest defenders of icons, Leo’s son Constantine V (r. 741–775) seized their property, executed some of the monks, and forced other monks into the army. Theological disputes and civil disorder over the icons continued intermittently until 843, when the icons were restored.

iconoclastic controversy The conflict over the veneration of religious images in the Byzantine Empire.

The implications of the iconoclastic controversy extended far beyond strictly theological issues. Iconoclasm raised the question of the right of the emperor to intervene in religious disputes. Iconoclasm antagonized the pope and served to encourage him in his quest for an alliance with the Frankish monarchy (see “The Warrior-Ruler Charlemagne”), which further divided the two parts of Christendom. The ultimate acceptance of icons profoundly influenced subsequent art within both Eastern and Western Christianity.

ANALYZING THE EVIDENCE

Orthodox Icon of Jesus



Dagli Orti/REX/Shutterstock

In this painted icon, made for the monastery of Saint Catherine in Egypt in the eighth century, Jesus is shown on the cross, wearing a tunic and a crown of thorns, while blood spurts from his side. Above him are two angels who gesture toward him, one with what appears to be blood on his hand. Religious images, often called “icons” in the Eastern Christian or Orthodox Church, were important means of communicating Christian ideas, as most people could not read. Some early church leaders opposed them, because they thought people might worship or pray to the icon instead of God and come to think of the religious image itself as divine. This opposition was an inheritance from Judaism, which regarded any attempt to portray the divine as wrong and saw religious rituals that involved images as worshipping idols. Gradually Christian teaching came to make a distinction between venerating icons and worshipping idols: actually worshipping religious images themselves was wrong, but venerating icons of Jesus, the Virgin Mary, and the saints fostered reverence and helped believers connect with the divine. Believers could also ask the individual depicted in the icon to plead a cause to God the Father and intercede on their behalf. (For more about the role of saints, see “The Process of Conversion.”)

In the seventh century, a period of crisis in the Byzantine Empire, the veneration of icons became an even more important part of popular religious devotion. Many people thought that icons had power in and of themselves, and that some were even miraculously created, rather than made by human hands. Many church officials and some Byzantine emperors argued that people were now worshipping the image itself rather than what it signified. This, they claimed, constituted idolatry, a violation of one of the Ten Commandments, the religious and moral code found in Hebrew Scripture that was also sacred to Christians. Images of Christ, they argued, were particularly objectionable, as his divine and human natures could never be represented in physical form. Beginning in 730 they ordered images taken down and destroyed, which led to decades of violent controversy.

QUESTIONS FOR ANALYSIS

1. How does the icon evoke emotions and religious devotion in its portrayal of Jesus?
2. How do Christian icons link with Greco-Roman traditions in terms of the portrayal of divine figures?
3. This image was made in the eighth century, in the middle of the iconoclastic controversy. Why do you think the monastery that ordered it did so at just this time?

Migrating Peoples

How did the barbarians shape social, economic, and political structures in Europe and western Asia?

The word *barbarian* comes from the Greek *barbaros*, meaning someone who did not speak Greek. (To the Greeks, others seemed to be speaking nonsense syllables; *barbar* is the Greek equivalent of “blah-blah” or “yada-yada.”) The Greeks used this word to include people such as the Egyptians, whom the Greeks respected. The Romans usually used the Latin version of *barbarian* to mean the peoples who lived beyond the northeastern boundary of Roman territory, whom they regarded as unruly, savage, and primitive. (See “Global Viewpoints: Roman and Byzantine Views of Barbarians,” page 216.) That value judgment is generally also present when we use *barbarian* in English, but there really is no other word to describe the many different peoples who lived to the north of the Roman Empire. Thus historians of late antiquity use the word *barbarian* to designate these peoples, who spoke a variety of languages but had similarities in their basic social, economic, and political structures (Map 8.2). Many of these historians find much to admire in barbarian society.

MAP 8.2 The Barbarian Migrations, ca. 340–500 Various barbarian groups migrated throughout Europe and western Asia in late antiquity, pushed and pulled by a number of factors. Many of them formed loosely structured states, of which the Frankish kingdom would become the most significant.

Barbarians included many different ethnic groups with social and political structures, languages, laws, and beliefs developed in central and northern Europe and western Asia over many centuries. Among the largest barbarian groups were the Celts (KELTS) (whom the Romans called Gauls) and Germans; Germans were further subdivided into various tribes, such as Ostrogoths, Visigoths, Burgundians, and Franks. *Celt* and *German* are often used as ethnic terms, but they are better understood as linguistic terms, a Celt being a person who spoke a Celtic language and a German one who spoke a Germanic language. Celts, Germans, and other barbarians brought their customs and traditions with them when they moved south and west, and these gradually combined with classical and Christian customs and beliefs to form new types of societies. From this cultural mix the Franks emerged as an especially strong and influential force, and they built a lasting empire (see “The Warrior-Ruler Charlemagne”).

GLOBAL VIEWPOINTS

Roman and Byzantine Views of Barbarians

The earliest written records about the barbarian groups that migrated, attacked, and sometimes conquered the more urbanized and densely populated areas of Europe and western Asia all come from the pens of educated Greeks, Romans, and Byzantines. They provide us with important information about barbarians, but always from the perspective of outsiders with a particular point of view. The selections below are typical of such commentary. The first is from the fourth-century Roman general and historian Ammianus Marcellinus, who fought in Roman armies against Germanic tribes, the Huns, and the Persians and later wrote a history of the Roman Empire. The second is from the sixth-century Byzantine historian Agathias, who described recent encounters between the forces of the Byzantine emperor Justinian and various Germanic tribes.

Ammianus Marcellinus on the Huns, ca. 380

■ The people of the Huns, but little known from ancient records, dwelling beyond the Maeotic Sea near the ice-bound ocean, exceed every degree of savagery…. They all have compact, strong limbs and thick necks, and are so monstrously ugly and misshapen, that one might take them for two-legged beasts or for the stumps, rough-hewn into images, that are used in putting sides to bridges. But although they have the form of men, however ugly, they are so hardy in their mode of life that they have no need of fire nor of savory food, but eat the roots of wild plants and the half-raw flesh of any kind of animal whatever, which they put between their thighs and the backs of their horses, and thus warm a little. They are never protected by any buildings, but they avoid these like tombs…. They are not at all adapted to battles on foot, but they are almost glued to their horses, which are hardy, it is true, but ugly…. They fight from a distance with missiles having sharp bone [points], instead of the usual (metal) parts, joined to the shafts with wonderful skill; then they gallop over the intervening spaces and fight hand to hand with swords, regardless of their own lives…. No one in their country ever plows a field or touches a plow-handle. They are all without fixed abode, without hearth, or law, or settled mode of life, and keep roaming from place to place, like fugitives, accompanied by wagons in which they live; in wagons their wives weave for them their hideous garments, in wagons they cohabit with their husbands, bear children, and rear them to the age of puberty.

Agathias on the Franks

■ The Franks are not nomads, as indeed some barbarian peoples are, but their system of government, administration and laws are modelled more or less on the Roman pattern, apart from which they uphold similar standards with regard to contracts, marriage, and religious observance. They are in fact all Christians and adhere to the strictest orthodoxy. They also have magistrates in their cities and priests and celebrate the feasts in the same way we do, and, for a barbarian people, strike me as extremely well-bred and civilized and as practically the same as ourselves except for their uncouth style of dress and peculiar language. I admire them for their other attributes and especially for the spirit of justice and harmony which prevails amongst them.

QUESTIONS FOR ANALYSIS

1. What qualities of the Huns does Ammianus Marcellinus find admirable? What does he criticize?
2. What qualities of the Franks does Agathias praise? Why does he find these qualities admirable?
3. How does the fact that both Ammianus Marcellinus and Agathias come from agricultural societies with large cities shape their views of barbarians?

Social and Economic Structures

Barbarian groups usually resided in small villages, and climate and geography determined the basic patterns of agricultural and pastoral life. Many groups settled on the edges of clearings where they raised barley, wheat, oats, peas, and beans. Men and women tilled their fields with simple scratch plows and harvested their grain with small iron sickles. The kernels of grain were eaten as porridge, ground up for flour, or fermented into strong, thick beer. Most of people’s caloric intake came from grain in some form.

Within the villages, there were great differences in wealth and status. Free men and their families constituted the largest class, and the number of cattle these men possessed indicated their wealth and determined their social status. Free men also took part in tribal warfare. Slaves acquired through warfare worked as farm laborers, herdsmen, and household servants. Barbarian society was patriarchal: within each household the father had authority over his wife, children, and slaves. Some wealthy and powerful men had more than one wife, a pattern that continued even after they became Christian, but polygamy was not widespread among ordinary people. Once women were widowed, they sometimes assumed their husbands’ rights over family property and took guardianship of their children.

Tribes, Warriors, and Laws

The basic social and political unit among barbarian groups was the tribe or confederation, made up of kin groups whose members believed they were all descended from a common ancestor. Tribes were led by chieftains, who were elected from among the male members of the most powerful family. The chief led the tribe in war, settled disputes among its members, conducted negotiations with outside powers, and offered sacrifices to the gods. As barbarian groups migrated into and conquered parts of the Western Roman Empire, their chiefs became even more powerful. Often chiefs adopted the title of king.

Closely associated with the chief in some tribes was the comitatus (kuhm-ee-TAH-tuhs), or war band. The warriors swore loyalty to the chief and fought alongside him in battle. Warriors may originally have been relatively equal to one another, but during the migrations and warfare of the second through the fourth centuries, the war band was transformed into a system of stratified ranks. When tribes settled down, warriors also began to acquire land as both a mark of prestige and a means to power. Social inequalities emerged and gradually grew stronger. These inequalities help explain the origins of the European noble class.

Visigothic Work and Play This page comes from one of the very few manuscripts from the time of the barbarian invasions to have survived, a copy of the first five books of the Old Testament — the Pentateuch — made around 600, perhaps in Visigothic Spain or North Africa. The top shows biblical scenes, while the bottom shows people engaged in everyday activities: building a wall, drawing water from a well, and trading punches.

Early barbarian tribes had no written laws, but beginning in the late fifth century some chieftains began to collect, write, and publish lists of their customs and laws. (See “Thinking Like a Historian: Slavery in Roman and Germanic Society,” page 204.) Barbarian law codes often included clauses designed to reduce interpersonal violence. Any crime that involved a personal injury, such as assault, rape, and murder, was given a particular monetary value, called the **wergeld** (WUHR-gehld) (literally “man-money”) that was to be paid by a person accused of a crime to the victim or the victim’s family. The wergeld varied according to the severity of the crime and also the social status and gender of the victim, and was designed to prevent an act of violence from escalating into a blood-feud between families.

wergeld Compensatory payment for death or injury set in many barbarian law codes.

Like most people of the ancient world, barbarians worshipped hundreds of gods and goddesses with specialized functions. They regarded certain mountains, lakes, rivers, or groves of trees as sacred because these were linked to deities. Among the Celts, religious leaders called druids had legal and educational as well as religious functions, orally passing down laws and traditions from generation to generation. Bards singing poems and ballads also passed down myths and stories of heroes and gods, which were written down much later.

Migrations and Political Change

Migrating groups that the Romans labeled barbarians had moved southward and eastward off and on since about 100 C.E. (see “Migrating Peoples”). Why did the barbarians migrate? In part, they were searching for more regular supplies of food, better farmland, and a warmer climate. Conflicts within and among barbarian groups also led to war and disruption, which motivated groups to move. Roman expansion led to further movement of barbarian groups but also to the blending of cultures.

The spread of the Celts presents a good example of both conflict and assimilation. Celtic-speaking peoples had lived in central Europe since at least the fifth century B.C.E. and had spread out from there to the Iberian Peninsula in the west, Hungary in the east, and the British Isles in the north. As Julius Caesar advanced northward into what he termed Gaul (present-day France), he defeated many Celtic tribes (see Map 6.2). Celtic peoples conquered by the Romans often assimilated to Roman ways, intermarrying with Romans and adopting the Latin language and many aspects of Roman culture. By the fourth century C.E., however, Gaul and Britain were under pressure from Germanic groups moving westward. Roman troops withdrew from Britain, and Celtic-speaking peoples clashed with Germanic-speaking invaders, of whom the largest tribes were the Angles and the Saxons. Some Celtic-speakers moved farther west. Others remained and intermarried with Germanic peoples, their descendants forming a number of small Anglo-Saxon kingdoms.

Anglo-Saxon Helmet This ceremonial bronze helmet from seventh-century England was found inside a ship buried at Sutton Hoo. The nearly 100-foot-long ship was dragged overland before being buried completely. It held one body and many grave goods, including swords, gold buckles, and silver bowls made in Byzantium. The unidentified person who was buried here was clearly wealthy and powerful, and so was very likely a chief.

In eastern Europe, a significant factor in barbarian migration and the merging of various Germanic groups was pressure from nomadic steppe peoples from central Asia, most prominently the Huns, who attacked the Black Sea area and the Eastern Roman Empire beginning in the fourth century. Under the leadership of their warrior-king Attila, the Huns attacked the Byzantine Empire in 447 and then turned westward, allying with some Germanic groups and moving into what is now France. After Attila turned his army southward and crossed the Alps into Italy, a papal delegation, including Pope Leo I himself, asked him not to attack Rome. Though papal diplomacy was later credited with stopping the advance of the Huns, their dwindling food supplies and a plague that spread among their troops were probably much more important factors. The Huns retreated from Italy, and within a year Attila was dead. The Huns never again played a significant role in European history. Their conquests had pushed many Germanic groups together, however, which transformed smaller bands of people into larger, more unified peoples who could more easily pick the Western Roman Empire apart.

After they conquered an area, barbarians generally established states ruled by kings. However, the kingdoms did not have definite geographical borders, and their locations shifted as tribes moved. Eventually, barbarian kingdoms came to include Italy itself. The Western Roman emperors increasingly relied on barbarian commanders and their troops to maintain order, and, as we saw in Chapter 6, in 476 the barbarian chieftain Odoacer (oh-doh-AY-suhr) deposed Romulus Augustus, the last person to have the title of Roman emperor in the West. Odoacer did not take the title of emperor, calling himself instead the king of Italy, so this date marks the official end of the Roman Empire in the West. From Constantinople, Eastern Roman emperors such as Justinian (see “Sources of Byzantine Strength”) worked to reconquer at least some of the West from barbarian tribes. They were occasionally successful but could not hold the empire together for long.

Christian Missionaries and Conversion

How did the church convert barbarian peoples to Christianity?

The Mediterranean served as the highway over which Christianity spread to the cities of the Roman Empire. Christian teachings were often spread into the countryside and into areas beyond the borders of the empire by those who had dedicated their lives to the church, such as monks. Such missionaries were often sent by popes specifically to convert certain groups.

Missionaries' Actions

Throughout barbarian Europe, religion was not a private or individual matter; it was a social affair, and the religion of the chieftain or king determined the religion of the people. Thus missionaries concentrated their initial efforts not on ordinary people but on kings or tribal chieftains and the members of their families. Because they had more opportunity to spend time with missionaries, queens and other female members of the royal family were often the first converts in an area, and they influenced their husbands and brothers. Germanic kings sometimes accepted Christianity because they came to believe that the Christian God was more powerful than pagan gods and that the Christian God — in either its Arian or Roman version — would deliver victory in battle.

Many barbarian groups were converted by Arian missionaries (see "The Evolution of Church Leadership and Orthodoxy"), who also founded dioceses. Bishop Ulfilas (ca. 310–383), for example, an Ostrogoth himself, translated the Bible from Greek into the Gothic language even before Jerome wrote the Latin Vulgate, creating a new Gothic script in order to write it down. In the sixth and seventh centuries most Goths and other Germanic tribes converted to Roman Christianity, sometimes peacefully and sometimes as a result of conquest. Ulfilas's Bible — and the Gothic script he invented — were forgotten and rediscovered only a thousand years later.

Tradition identifies the conversion of Ireland with Saint Patrick (ca. 385–461). After a vision urged him to Christianize Ireland, Patrick studied in Gaul and in 432 was consecrated a bishop. He then returned to Ireland, where he converted the Irish tribe by tribe, first baptizing the king.

The Christianization of the English began in earnest in 597, when Pope Gregory I (pontificate 590–604) sent a delegation of monks to England. The conversion of the English had far-reaching consequences because

Britain later served as a base for the Christianization of Germany and other parts of northern Europe (Map 8.3). In eastern Europe Byzantine missionaries gained converts among the Bulgars and Slavs. Between the fifth and tenth centuries the majority of people living in Europe accepted the Christian religion — that is, they received baptism, though baptism in itself did not automatically transform people into Christians.

Mapping the Past

MAP 8.3 The Spread of Christianity, ca. 300–800 Originating in the area near Jerusalem, Christianity spread throughout and then beyond the Roman world.

ANALYZING THE MAP Based on the map, how did the roads and sea-lanes of the Roman Empire influence the spread of Christianity?

CONNECTIONS How does the map support the conclusion that Christianity began as an urban religion and then spread into more rural areas?

The Process of Conversion

When a ruler marched his people to the waters of baptism, the work of Christianization had only begun. Churches could be built, and people could be required to attend services and belong to parishes, but the process of conversion was a gradual one.

How did missionaries and priests get masses of pagan and illiterate peoples to understand Christian ideals and teachings? They did it through preaching, assimilation of pagan customs, the ritual of penance, and veneration of the saints. Those who preached aimed to present the basic teachings of Christianity and strengthen the newly baptized in their faith through stories about the lives of Christ and the saints.

Deeply ingrained pagan customs and practices, however, could not be stamped out by words alone. Thus Christian missionaries often pursued a policy of assimilation, easing the conversion of pagan men and women by stressing similarities between their customs and beliefs and those of Christianity and by mixing barbarian pagan ideas and practices with Christian ones. For example, bogs and lakes sacred to Germanic gods became associated with saints, as did various aspects of ordinary life, such as traveling, planting crops, and worrying about a sick child. Aspects of existing midwinter celebrations were assimilated into celebrations of Christmas. Spring rituals involving eggs and rabbits (both symbols of fertility) were added to celebrations of Easter. People joined with family members, friends, and neighbors to celebrate these holidays, and also baptisms, weddings, and funerals, presided over by a priest.

The ritual of **penance** was also instrumental in teaching people Christian ideas. Christianity taught that certain actions and thoughts were sins. Only by confessing sins and asking forgiveness could a sinning believer be reconciled with God. Confession was initially a public ritual, but by the fifth century individual confession to a parish priest was more common. During this ritual the individual knelt before the priest, who questioned him or her about sins he or she might have committed. The priest then set a penance such as fasting or saying specific prayers to allow the person to atone for the sin. Penance gave new converts a sense of the behavior expected of Christians, encouraged the private examination of conscience, and offered relief from the burden of sinful deeds.

penance Ritual in which Christians asked a priest for forgiveness for sins and the priest set certain actions to atone for the sins.

Veneration of **saints**, people who had lived (or died) in a way that was spiritually heroic or noteworthy, was another way that Christians formed stronger connections with their religion. Saints were understood to provide protection and assistance to worshippers, and parish churches often housed saints’ relics, that is, bones, articles of clothing, or other objects associated with them. The relics served as links between the material world and the spiritual, and miracle stories about saints and their relics were an important part of Christian preaching and writing.

saints People who were venerated for having lived or died in a way that was spiritually heroic or noteworthy.

Christians came to venerate the saints as powerful and holy. They prayed to saints or to the Virgin Mary to intercede with God, or they simply asked the saints to assist and bless them. The entire village participated in processions marking saints’ days or important points in the agricultural year, often carrying images of saints or their relics around the houses and fields. The decision to adopt Christianity was often made first by an emperor or king, but actual conversion was a local matter, as people came to feel that the parish priest and the saints provided them with benefits in this world and the world to come.

Frankish Rulers and Their Territories

How did the Franks build and govern a European empire?

Most barbarian kingdoms did not last very long, but one that did — and that came to have a decisive role in history — was that of the confederation of Germanic peoples known as the Franks. In the fourth and fifth centuries the Franks settled within the empire and allied with the Romans, some attaining high military and civil positions. Though at that time the Frankish kingdom was simply one barbarian kingdom among many, rulers after the influential Clovis used a variety of tactics to expand their holdings, enhance their authority, and create a stable system. Charles the Great (r. 768–814), generally known by the French version of his name, Charlemagne (SHAHR-luh-mayne), created the largest state in western Europe since the Roman Empire.

The Merovingians and Carolingians

The Franks believed that Merovech, a semi-legendary figure, founded their ruling dynasty, which was thus called **Merovingian** (mehr-uh-VIHN-jee-uhn). The reign of Clovis (r. ca. 481–511) was decisive in the development of the Franks as a unified people. Through military campaigns, Clovis acquired the central provinces of Roman Gaul and began to conquer southern Gaul from other Germanic tribes. His wife, Clotild, a Roman Christian, pressured him to convert, but he refused. His later biographer Gregory of Tours, a bishop in the Frankish kingdom in the sixth century, attributed his conversion to a battlefield vision, just as Emperor Constantine's biographers had reported about his conversion.

Merovingian A dynasty of rulers that decisively unified the Franks under the reign of Clovis (ca. 481–511) and ruled the Frankish kingdom until the seventh century.

Most historians today conclude that Clovis's conversion to Roman Christianity was a pragmatic choice: it brought him the crucial support of the bishops of Gaul in his campaigns against tribes that were still pagan or had accepted the Arian version of Christianity. As the defender of Roman Christianity against heretical tribes, Clovis went on to conquer the Visigoths, extending his domain to include much of what is now France and southwestern Germany.

Following Frankish traditions in which property was divided among male heirs, at Clovis's death his kingdom was divided among his four sons. For the next two centuries rulers of the various kingdoms fought one another in civil wars, and other military leaders challenged their authority.

Merovingian kings based some aspects of their government on Roman principles. For example, they adopted the Roman concept of the *civitas* — Latin for a city and its surrounding territory. A count presided over the civitas, raising troops, collecting royal revenues, and providing justice. Within the royal household, Merovingian politics provided women with opportunities, and some queens not only influenced but occasionally also dominated events. Because the finances of the kingdom were merged with those of the royal family, queens often had control of the royal treasury just as more ordinary women controlled household expenditures.

Merovingian Jewelry These earrings and brooches, made of gilt silver, cloisonné enamel, pearls, garnets, lapis lazuli, and other semiprecious stones, were made by a skilled Merovingian metal-smith, no doubt for a wealthy and powerful customer. As today, eye-catching jewelry in Merovingian society showed one's social status, as the raw materials were expensive and often came from far away, and making it took a great deal of skill and time.

At the king's court an official called the mayor of the palace supervised legal, financial, and household officials; the mayor of the palace also governed in the king's absence. In the seventh century the position as mayor was held by members of an increasingly powerful family, the **Carolingians** (ka-ruh-LIHN-jee-uhns), who advanced themselves through advantageous marriages, a well-earned reputation for military strength, and the help of the church. *Carolingian* derives from the Latin word for "Charles," the name of several members of this dynasty.

Carolingian A dynasty of rulers that took over the Frankish kingdom from the Merovingians in the seventh century; *Carolingian* derives from the Latin word for "Charles," the name of several members of this dynasty.

Eventually the Carolingians replaced the Merovingians as rulers of the Frankish kingdom, cementing their authority when the Carolingian Charles Martel defeated Muslim invaders in 732 at the Battle of Poitiers (pwah-tee-AY) in central France. Muslims and Christians have interpreted the battle differently. Muslims considered it a minor skirmish and attributed the Frankish victory to Muslim difficulties in maintaining supply lines over long distances and to ethnic conflicts and unrest in Islamic Spain. Charles Martel and later Carolingians used the victory to portray themselves as defenders of Christendom against the Muslims.

The Battle of Poitiers helped the Carolingians acquire more support from the church, perhaps their most important asset. They further strengthened their ties to the church by supporting the work of missionaries who preached Christian principles — including the duty to obey secular authorities — to pagan peoples and by allying themselves with the papacy against other Germanic tribes.

The Warrior-Ruler Charlemagne

The most powerful of the Carolingians was Charlemagne. Through brutal military expeditions that brought wealth and by peaceful travel, personal appearances, shrewd marital alliances, and the sheer force of his personality, Charlemagne sought to awe newly conquered peoples and rebellious domestic enemies. By around 805 the Frankish kingdom included all of continental Europe except Spain, Scandinavia, southern Italy, and the Slavic fringes of the East.

For administrative purposes, Charlemagne divided his entire kingdom into counties. Each of the approximately six hundred counties was governed by a count. As a link between local authorities and the central government, Charlemagne appointed officials called *missi dominici*, “agents of the lord king.” Each year beginning in 802 two missi, usually a count and a bishop or abbot, visited assigned districts. They checked up on the counts and their districts’ judicial, financial, and clerical activities. (See “Analyzing the Evidence: The Capitulary de Villis,” at right.)

Charlemagne’s Conquests, ca. 768–814

In the autumn of the year 800 Charlemagne visited Rome, where on Christmas Day Pope Leo III crowned him emperor. The event had momentous consequences. In taking as his motto *Renovatio romani imperi* (Revival of the Roman Empire), Charlemagne was deliberately perpetuating old Roman imperial ideas while identifying with the new Rome of the Christian Church. From Baghdad, the Abbasid Empire’s caliph, Harun al-Rashid (r. 786–809), congratulated Charlemagne on his coronation with the gift of an elephant. The elephant survived for nearly a decade, though like everyone else at Charlemagne’s capital of Aachen (AH-ken) on the western border of modern Germany, it lived in a city that was far less sophisticated, healthy, and beautiful than Abbasid Baghdad. Although the Muslim caliph recognized Charlemagne as a fellow sovereign, the Byzantines regarded his papal coronation as rebellious and Charlemagne as a usurper. His crowning as emperor thus marked a decisive break between Rome and Constantinople and gave church authorities in the West proof that the imperial title could be granted only by the pope.

Charlemagne and His Wife This illumination from a ninth-century manuscript portrays Charlemagne with one of his wives. Marriage was an important tool of diplomacy for Charlemagne, and he had a number of wives and concubines.

As he built an empire through conquest and strategic alliances, Charlemagne also set in motion a cultural revival that later historians called the "Carolingian Renaissance." The Carolingian Renaissance was a rebirth of interest in, study of, and preservation of the language, ideas, and achievements of classical Greece and Rome. Scholars at Charlemagne's capital of Aachen copied Greco-Roman and Christian books and manuscripts and created libraries housed in churches and monasteries. Furthermore, Charlemagne urged monasteries to promote Christian learning.

Charlemagne left his vast empire to his sole surviving son, Louis the Pious (r. 814–840), who attempted to keep the empire intact. This proved to be impossible. Members of the nobility engaged in plots and open warfare against the emperor, often allying themselves with one of Louis's three sons. In 843, shortly after Louis's death, those sons agreed to the **Treaty of Verdun**, which divided the empire into three parts: Charles the

Bald received the western part, Lothair the middle and the title of emperor, and Louis the eastern part, from which he acquired the title “the German.” Though of course no one knew it at the time, this treaty set the pattern for political boundaries in Europe that have been maintained through today, including the modern states of Germany, France, and Italy. Other than in brief periods under Napoleon and Hitler, Europe would never again see as large a unified state as it had under Charlemagne, which is one reason he has become a symbol of European unity in the twenty-first century.

The weakening of central power was hastened by invasions and migrations from the north, south, and east. Thus Charlemagne’s empire ended in much the same way that the Roman Empire had earlier, from a combination of internal weakness and external pressure.

ANALYZING THE EVIDENCE

The Capitulary de Villis

Charlemagne and other Frankish rulers issued sets of instructions and decisions, called capitularies, to their officials on legal, military, political, and economic matters. Like all instructions or sets of rules, capitularies describe an ideal, not the way things really were, but we can still use them as sources for many aspects of life. The Capitulary de Villis, issued in about 800, describes the wide variety of activities envisioned for royal manors, which were run by individuals called stewards.

We desire that each steward shall make an annual statement of all our income, giving an account of our lands cultivated by the oxen which our own plowmen drive and of our lands which the tenants of farms ought to plow; of the pigs, of the rents, of the obligations and fines; of the game taken in our forests without our permission; of the various compositions [things that have been made]; of the mills, of the forest, of the fields, of the bridges and ships; of the free men and the districts under obligations to our treasury; of markets, vineyards, and those who owe wine to us; of the hay, firewood, torches, planks, and other kinds of lumber; of the waste lands; of the vegetables, millet, panic [a type of millet]; of the wool, flax, and hemp; of the fruits of the trees; of the nut trees, larger and smaller; of the grafted trees of all kinds; of the gardens; of the turnips; of the fish ponds; of the hides, skins, and horns; of the honey and wax; of the fat, tallow [fat used for candles], and soap; of the mulberry wine, cooked wine, mead, vinegar, beer, and wine, new and old; of the new grain and the old; of the hens and eggs; of the geese; of the number of fishermen, workers in metal, sword makers, and shoemakers; of the bins and boxes; of the turners and saddlers; of the forges and mines, — that is, of iron, lead, or other substances; of the colts and fillies. They shall make all these known to us, set forth separately and in order, at Christmas, so that we may know what and how much of each thing we have.

The greatest care must be taken that whatever is prepared or made with the hands, — that is, bacon, smoked meat, sausage, partially salted meat, wine, vinegar, mulberry wine, cooked wine, garum [fermented fish sauce], mustard, cheese, butter, malt, beer, mead, honey, wax, flour, — all should be prepared and made with the greatest cleanliness.

Each steward on each of our domains shall always have, for the sake of ornament, peacocks, pheasants, ducks, pigeons, partridges, and turtle-doves. . . .

For our women’s work they are to give at the proper time, as has been ordered, the materials [for clothmaking], — that is, the linen, wool, woad [for making blue dye], vermilion [for making red dye], madder [for making yellow dye], wool combs, teasels, soap, grease, vessels, and the other objects which are necessary….

Each steward shall have in his district good workmen, namely, blacksmiths, a goldsmith, a silversmith, shoemakers, turners, carpenters, sword makers, fishermen, fowlers, soap makers, men who know how to make beer, cider, perry [pear cider], or other kind of liquor good to drink, bakers to make pastry for our table, net makers who know how to make nets for hunting, fishing, and fowling, and other sorts of workmen too numerous to be designated.

QUESTIONS FOR ANALYSIS

1. What tasks were men expected to do on Charlemagne’s estates? What tasks were seen as women’s work?
2. How does this listing of the work on medieval estates support the idea that the Carolingian economy was more localized than the economy of the Roman Empire had been? (See “Rome and the Provinces” in Chapter 6.)

Chapter Summary

During the sixth and seventh centuries the Byzantine Empire survived waves of attacks, owing to effective military leadership and to fortifications around Constantinople. Byzantine emperors organized and preserved Roman institutions, and the Byzantine Empire survived until 1453. The emperor Justinian oversaw creation of a new uniform code of Roman law. The Byzantines prized education, and because of them many aspects of ancient Greek thought survived to influence the intellectual life of the Muslim world and eventually that of western Europe.

Christianity gained the support of the fourth-century emperors, and the church gradually adopted the Roman system of hierarchical organization. The church possessed able administrators and leaders. Bishops expanded their activities, and in the fifth century the bishops of Rome, taking the title "pope," began to stress their supremacy over other Christian communities. Monasteries offered opportunities for individuals to develop deeper spiritual devotion and also provided a model of Christian living and places for education and learning. Christian thinkers reinterpreted the classics in a Christian sense, incorporating elements of Greek and Roman philosophy into Christian teachings.

Barbarian groups migrated throughout Europe and Central Asia beginning in the second century. Among barbarians, the basic social unit was the tribe, made up of kin groups and led by a tribal chieftain. Missionaries and priests persuaded pagan and illiterate peoples to accept Christianity. Most barbarian kingdoms were weak and short-lived, though the kingdom of the Franks was relatively more unified and powerful. Rulers first in the Merovingian dynasty, and then in the Carolingian, used military victories, carefully calculated marriage alliances, and the help of the church to enhance their authority. Carolingian government reached the peak of its power under Charlemagne, who brought much of Europe under his authority through military conquest and strategic alliances.

CONNECTIONS

For centuries the end of the Roman Empire in the West was seen as a major turning point in history: the fall of the sophisticated and educated classical world to uncouth and illiterate tribes, and the beginning of a "Dark Ages" that would last for centuries. Over the last several decades, however, many historians have put a greater emphasis on continuities. Barbarian kings relied on officials trained in

Roman law, and Latin remained the language of scholarly communication and the Christian Church. Greco-Roman art and architecture still adorned the land, and people continued to use Roman roads, aqueducts, and buildings. In eastern Europe and western Asia, the Byzantine Empire preserved the traditions of the Roman Empire and protected the intellectual heritage of Greco-Roman culture for another millennium.

In the middle of the era covered in this chapter, a new force emerged that had a dramatic impact on much of Europe and western Asia — Islam. In the seventh and eighth centuries Sassanid Persia, much of the Byzantine Empire, and the barbarian kingdoms in the Iberian Peninsula fell to Arab forces motivated by this new religion. As we have seen in this chapter, a reputation as victors over Islam helped the Franks establish the most powerful state in Europe. As we will see when we pick up the story of Europe again in Chapter 14, Islam continued to shape European culture and politics in subsequent centuries. In terms of world history, the expansion of Islam may have been an even more dramatic turning point than the fall of the Roman Empire. Here, too, however, there were continuities, as the Muslims adopted and adapted Greek, Byzantine, and Persian political and cultural institutions.

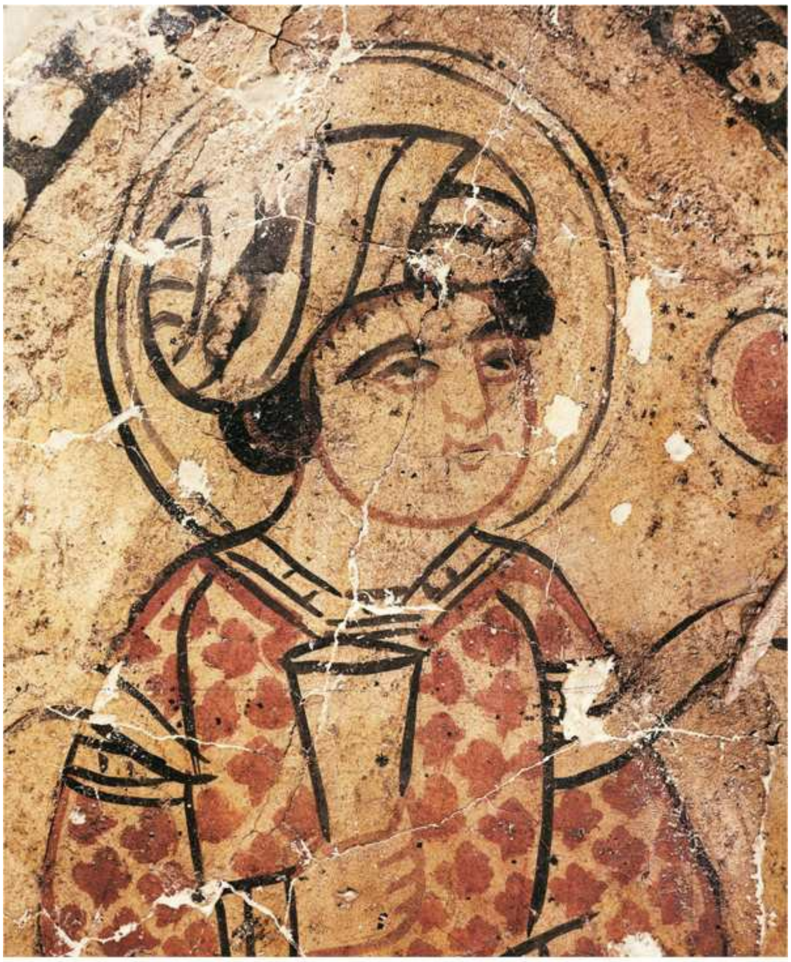
The Islamic World

600–1400



Islamic Art Museum, Cairo, Egypt/De Agostini Picture Library/Gianni Dagli Orti/Bridgeman Images

Egyptian Man

Life remained gracious in the great cities of North Africa and the Middle East even as Islam brought new traditions. This image of a man wearing a turban and holding a cup is from a wall painting. Found in Egypt, it dates to the eleventh century, during the Fatimid caliphate.

Around 610 in the city of Mecca in what is now Saudi Arabia, a merchant called Muhammad had a religious vision that inspired him to preach God's revelations to the people of Mecca. By the time he died in 632, he had many followers in Arabia, and a century later his followers controlled what is now Syria, Palestine, Egypt, Iraq, Iran, northern Africa, Spain, and southern France. Within another century Muhammad's beliefs had been carried across Central Asia to the borders of China and India. The speed with which Islam spread is one of the most amazing stories in world history, and scholars have pointed to many factors that must have contributed to its success. Military victories were rooted in strong military organization and the practice of establishing garrison cities in newly conquered territories. The religious zeal of new converts certainly played an important role. So too did the political weakness of many of the governments then holding power in the lands where Islam extended, such as the Byzantine government centered in Constantinople. Commerce and trade also spread the faith of Muhammad.

Although its first adherents were nomads, Islam developed and flourished in a mercantile milieu. By land and sea, Muslim merchants transported a rich variety of goods across Eurasia. On the basis of the wealth that trade generated, a gracious, sophisticated, and cosmopolitan culture developed with centers at Baghdad and Córdoba. During the ninth, tenth, and eleventh centuries, the Islamic world witnessed enormous intellectual vitality and creativity. Muslim scholars produced important work in many disciplines, especially mathematics, medicine, and philosophy. This brilliant civilization profoundly influenced the development of both Eastern and Western civilizations.

The Origins of Islam

From what kind of social and economic environment did Muhammad arise, and what did he teach?

Much of the Arabian peninsula is desert. Outside the oasis towns were Bedouin (BEH-duh-uhn) nomadic tribes who grazed sheep, goats, and camels. Though always small in number, Bedouins were politically dominant because of their toughness, solidarity, fighting traditions, possession of horses and camels, and ability to control trade and lines of communication. Mecca became the economic and cultural center of western Arabia, in part because pilgrims came to visit the Ka'ba, a temple containing a black stone thought to be a god's dwelling place. Muhammad's roots were in this region.

Arabian Social and Economic Structure

The basic social unit of the Bedouins and other Arabs was the tribe. Consisting of people connected through kinship, tribes provided protection and support and in turn expected members' total loyalty. Like the Germanic peoples in the age of their migrations (see "Migrating Peoples" in Chapter 8), Arab tribes were not static entities but rather continually evolving groups. A particular tribe might include both nomadic and sedentary members.

In northern and central Arabia in the early seventh century, tribal confederations led by their warrior elite were dominant. In the southern parts of the peninsula, however, priestly aristocracies tended to hold political power. Many oasis or market towns had a shrine to their guardian deity where the priest would try to settle disputes among warring tribes. All Arabs respected the shrines because they served as neutral places for such arbitration.

Page from Arabic Manuscript The aesthetic appeal of Arabic calligraphy is easy to recognize in this page from a fourteenth-century manuscript.

The power of the northern warrior tribes rested on their fighting skills. The southern religious aristocracy, by contrast, depended on its religious and economic power. The political genius of Muhammad was to bind together these different tribal groups into a strong, unified state.

Muhammad’s Rise as a Religious Leader

Much like the earliest accounts of Jesus and the Buddha, the earliest account of the life of Muhammad (ca. 570–632) comes from oral traditions passed down among followers. According to these traditions, Muhammad was a merchant in the caravan trade who later married a wealthy widow. At about age forty Muhammad had a vision of an angelic being who commanded him to preach the revelations that God would be sending him. Muhammad began to preach to the people of Mecca, urging them to give up their idols and to submit to the one indivisible God. After his death, scribes organized the revelations jotted down or memorized by followers. In 651 they published the version of them that Muslims consider authoritative, the **Qur'an** (kuh-RAHN). Muslims revere the Qur'an for its sacred message and for the beauty of its Arabic language.

Qur'an The sacred book of Islam.

For the first two or three centuries after the death of Muhammad, there was considerable debate about theological and political issues. Likewise, religious scholars had to sort out and assess the **hadith** (huh-DEETH), collections of the sayings and anecdotes about Muhammad. Muhammad's example as revealed in the hadith became the legal basis for the conduct of every Muslim. The life of Muhammad provides the "normative example," or **Sunna** (SOON-ah), for the Muslim believer.

The Tenets of Islam

Islam, the strict monotheistic faith that is based on the teachings of Muhammad, rests on the principle of the oneness and omnipotence of God (Allah). The word *Islam* means "surrender to God," and *Muslim* means "a person who submits." Muslims believe that Muhammad was the last of the prophets, completing the work begun by Abraham, Moses, and Jesus. Islam appropriates much of the Old and New Testaments of the Bible but often retells the narratives with significant shifts in meaning. Islam recognizes Moses's laws about circumcision, ritual bathing, and restrictions on eating pork and shellfish, and the Qur'an calls Christians "nearest in love" to Muslims. Muhammad insisted that he was not preaching a new message; rather, he was calling people back to the one true God, urging his contemporaries to reform their lives and return to the faith of Abraham, the first monotheist.

Unlike the Old Testament, much of which is historical narrative, or the New Testament, which is a collection of essays on the example and teachings of Jesus, the Qur'an is a collection of directives issued in God's name. Its organization is not strictly topical or chronological. To deal with seeming contradictions, later commentators explained the historical circumstances behind each revelation.

The Qur'an prescribes a strict code of moral behavior. A Muslim must recite the profession of faith in God and in Muhammad as his prophet: "There is no God but God, and Muhammad is his Prophet." A believer must also pray five times a day, fast and pray during the sacred month of Ramadan, make a pilgrimage (hajj) to the holy city of Mecca once during his or her lifetime, and give alms to the Muslim poor. These fundamental obligations are known as the **Five Pillars of Islam**.

Five Pillars of Islam The basic tenets of the Islamic faith; they include reciting a profession of faith in God and in Muhammad as God's prophet, praying five times daily, fasting and praying during the month of Ramadan, making a pilgrimage to Mecca once in one's lifetime, and contributing alms to the poor.

Islam forbids alcoholic beverages and gambling. It condemns usury in business — that is, lending money and charging the borrower interest — and taking advantage of market demand for products to raise prices. Muslim jurisprudence condemned licentious behavior by both men and women and specified the same punishments for both.

As on the Christian Judgment Day, on the Islamic Judgment Day God will separate the saved and the damned. The Qur'an describes in detail the frightful tortures with which God will punish the damned and the heavenly rewards of the saved and the blessed.

Islamic States and Their Expansion

What made possible the spread of Islam, and what forms of government were established to rule Islamic lands?

According to Muslim tradition, Muhammad’s preaching at first did not appeal to many people — for the first three years he attracted only fourteen believers. In preaching a transformation of the social order and calling for the destruction of the idols in the Ka’ba, Muhammad challenged the power of the local elite and the pilgrimage-based economy. As a result, the townspeople of Mecca turned against him, and he and his followers were forced to flee to Medina. This *hijra* (hih-JIGH-ruh), or emigration, occurred in 622, and Muslims later dated the beginning of their era from it.

At Medina, Muhammad attracted increasing numbers of believers, many of whom were Bedouins who supported themselves by raiding caravans en route to Mecca, setting off a violent conflict between Mecca and Medina. After eight years of strife, Mecca capitulated. In this way, by the time Muhammad died in 632, he had welded together all the Bedouin tribes.

Muhammad displayed genius as both political strategist and religious teacher. He gave Arabs the idea of a unique and unified **umma** (UH-muh), or community, that consisted of all those whose bond was a common religious faith. The umma was to be a religious and political community led by Muhammad for the achievement of God’s will on earth. The Islamic notion of an absolute higher authority transcended the boundaries of individual tribal units and fostered political consolidation. All authority came from God through Muhammad.

umma A community of people who share a religious faith and commitment rather than a tribal tie.

Islam’s Spread Beyond Arabia

After the Prophet’s death, Islam quickly spread far beyond Arabia. In the sixth century two powerful empires divided the Middle East: the Greek-Byzantine empire centered at Constantinople and the Persian-Sassanid empire concentrated at Ctesiphon (near Baghdad in present-day Iraq). The Byzantine Empire stood for Hellenistic culture and championed Christianity (see Chapter 8). The Sassanid empire espoused Persian cultural traditions and favored the religious faith known as Zoroastrianism (see “The Religion of Zoroaster” in Chapter 2). From the fourth through sixth centuries the Byzantines and Sassanids fought each other fiercely, each trying to expand its territories at the expense of the other and to control and tax the rich trade coming from Arabia and the Indian Ocean region. Many peripheral societies were drawn into the conflict. The resulting disorder facilitated the growth of Islamic states.

The second and third successors of Muhammad, Umar (r. 634–644) and Uthman (r. 644–656), launched a two-pronged attack against the Byzantine and Sassanid Empires. One force moved north from Arabia against the Byzantine provinces of Syria and Palestine (see Map 8.1, page 202). From Syria, the Muslims conquered the rich province of Egypt. Simultaneously, Arab armies swept into the Sassanid empire. The Muslim defeat of the Persians at Nihawand in 642 signaled the collapse of this empire (Map 9.1).

Mapping the Past

MAP 9.1 The Expansion of Islam, 622–900 The rapid expansion of Islam in a relatively short span of time testifies to the Arabs’ superior fighting skills, religious zeal, and economic ambition as well as to their enemies’ weakness. Plague, famine, and political troubles in Sassanid Persia contributed to Muslim victory there.

ANALYZING THE MAP Trace the routes of the spread of Islam by time period. How fast did it spread? How similar were the climates of the regions that became Muslim?

CONNECTIONS Which were the most powerful and populous of the societies that were absorbed into the Islamic world? What regions or societies were more resistant?

The Muslims continued their drive eastward and in the mid-seventh century occupied the province of Khurasan. By 700 the Muslims had crossed the Oxus River and swept toward Kabul, today the capital of Afghanistan. They then penetrated Kazakhstan and seized Tashkent. From southern Persia, a Muslim force marched into the Indus Valley in northwest India in 713 and founded an Islamic community there.

To the west, Arab forces moved across North Africa and crossed the Strait of Gibraltar. In 711 at the Guadalete River they easily defeated the Visigothic kingdom of Spain. Muslims controlled most of Spain until the thirteenth century. Advances into France were stopped in 732 when the Franks defeated Arab armies in a battle near the city of Tours, and Muslim occupation of parts of southern France did not last long.

Reasons for the Spread of Islam

By the beginning of the eleventh century the crescent of Islam had flown from the Iberian heartlands to northern India. How can this rapid and remarkable expansion be explained? Most historians point to a combination of the Arabs’ military advantages and the political weaknesses of their opponents. The Byzantine and Sassanid Empires had just fought a grueling century-long war and had also been weakened by the plague, which hit urban, stationary populations harder than nomadic populations. Equally important are the military strength and tactics of the Arabs. For example, rather than scattering as landlords of peasant farmers over conquered lands, Arab soldiers remained together in garrison cities, where their Arab ethnicity, tribal organization, religion, and military success set them apart. All soldiers were registered in the **diwān** (dih-WAHN), an administrative organ adopted from the Persians or Byzantines. Soldiers received a monthly ration of food for themselves and their families and an annual cash stipend. In return, they had to be available for military service. Fixed salaries, regular pay, and the lure of battlefield booty attracted rugged tribesmen from Arabia.

The Caliphate and the Split Between Shi’a and Sunni Alliances

When Muhammad died in 632, he left a large Muslim umma, but this community stood in danger of disintegrating into separate tribal groups.

Neither the Qur’an nor the Sunna offered guidance concerning the succession.

In this crisis, according to tradition, a group of Muhammad’s ablest followers elected Abu Bakr (573–634), the Prophet’s father-in-law and close supporter, and hailed him as caliph (KAY-lihf), a term combining the ideas of leader, successor, and deputy (of the Prophet). In the two years of his rule (632–634), Abu Bakr governed on the basis of his personal prestige within the Muslim umma. He sent out military expeditions, collected taxes, dealt with tribes on behalf of the entire community, and led the community in prayer.

Gradually, under Abu Bakr’s first three successors, Umar (r. 634–644), Uthman (r. 644–656), and Ali (r. 656–661), the caliphate (KAL-uh-fate) emerged as an institution. Umar succeeded in exerting his authority over the Bedouin tribes involved in ongoing conquests. Uthman asserted the right of the caliph to protect the economic interests of the entire umma. Also, Uthman’s publication of the definitive text of the Qur’an showed his concern for the unity of the umma. However, Uthman was from a Mecca family that had resisted the Prophet until the capitulation of Mecca in 630, and he aroused resentment when he gave favors to members of his family. Opposition to Uthman coalesced around Ali, and when Uthman was assassinated in 656, Ali was chosen to succeed him.

Uthman’s cousin Mu’awiya, a member of the Umayyad family who had built a power base as governor of Syria, refused to recognize Ali as caliph. In the ensuing civil war Ali was assassinated, and Mu’awiya (r. 661–680) assumed the caliphate. Mu’awiya founded the Umayyad Dynasty and shifted the capital of the Islamic state from Medina in Arabia to Damascus in Syria. Although electing caliphs remained the Islamic ideal, beginning with Mu’awiya, the office of caliph increasingly became hereditary. Two successive dynasties, the Umayyad (661–750) and the Abbasid (750–1258), held the caliphate.

From its inception the caliphate rested on the theoretical principle that Muslim political and religious unity transcended tribalism. Mu’awiya sought to enhance the power of the caliphate by making tribal leaders dependent on him for concessions and special benefits. At the same time, his control of a loyal and well-disciplined army enabled him to take the caliphate in an authoritarian direction. Through intimidation he forced the tribal leaders to accept his son Yazid as his heir, thereby establishing the dynastic principle of succession.

The assassination of Ali and the assumption of the caliphate by Mu’awiya had another profound consequence. It gave rise to a fundamental division in the umma and in Muslim theology. Ali had claimed the caliphate on the basis of family ties — he was Muhammad’s cousin and son-in-law. When Ali was murdered, his followers argued that Ali had been the Prophet’s designated successor — partly because of the blood tie, partly because Muhammad had designated Ali **imam** (ih-MAHM), or leader in community prayer. These supporters of Ali were called **Shi’a** (SHEE-uh), meaning “supporters” or “partisans” of Ali (Shi’a are also known as Shi’ites). In succeeding generations, opponents of the Umayyad Dynasty emphasized their blood descent from Ali and claimed to possess divine knowledge that Muhammad had given them as his heirs.

This exquisite side panel depicts an eleventh-century caliph flanked by two attendants. An inscription on the front translates as "In the Name of God. Blessings from God, goodwill, and happiness."

Those who accepted Mu'awiya as caliph insisted that the central issue was adhering to the practices and beliefs of the umma based on the precedents of the Prophet. They came to be called **Sunnis** (SOO-neez), which derived from *Sunna* (examples from Muhammad's life). When a situation arose for which the Qur'an offered no solution, Sunni scholars searched for a precedent in the Sunna, which gained an authority comparable to that of the Qur'an itself.

Sunnis Members of the larger of the two main divisions of Islam; the division between Sunnis and Shi’a began in a dispute about succession to Muhammad, but over time many differences in theology developed.

Both Sunnis and Shi’a maintain that authority within Islam lies first in the Qur’an and then in the Sunna. Who interprets these sources? Shi’a claim that the imam does, for he is invested with divine grace and insight. Sunnis insist that interpretation comes from the consensus of the **ulama**, the group of religious scholars.

ulama A group of religious scholars whom Sunnis trust to interpret the Qur’an and the Sunna.

Throughout the Umayyad period, the Shi’a constituted a major source of discontent. They condemned the Umayyads as worldly and sensual rulers, in contrast to the pious true successors of Muhammad. A rival Sunni clan, the Abbasid (uh-BA-suhd), exploited the situation, agitating the Shi’a and encouraging dissension among tribal factions.

The Abbasid Caliphate

In 747 the Abbasid leader Abu’ al-Abbas led a rebellion against the Umayyads, and in 750 he won general recognition as caliph. Damascus had served as the headquarters of Umayyad rule. Abu’ al-Abbas’s successor, al-Mansur (r. 754–775), founded the city of Baghdad in 762 and made it his capital. Thus the geographical center of the caliphate shifted eastward to former Sassanid territories. The first three Abbasid caliphs crushed their opponents, turned against many of their supporters, and created a new ruling elite drawn from newly converted Persian families that had traditionally served the ruler. The Abbasid revolution established a basis for rule and citizenship more cosmopolitan and Islamic than the narrow, elitist, and Arab basis that had characterized Umayyad government.

The Abbasids worked to identify their rule with Islam. They patronized the ulama, built mosques, and supported the development of Islamic scholarship. Although at first Muslims represented only a small minority of the conquered peoples, Abbasid rule provided the religious-political milieu in which Islam gained, over time, the allegiance of the vast majority of the populations from Spain to Afghanistan.

The Abbasids also borrowed heavily from Persian culture. Following Persian tradition, the Abbasid caliphs claimed to rule by divine right, as reflected in the change of their title from “successor of the Prophet” to “deputy of God.” A majestic palace with hundreds of attendants and elaborate court ceremonies deliberately isolated the caliph from the people he ruled. Subjects had to bow before the caliph and kiss the ground, symbolizing his absolute power.

Under the third caliph, Baghdad emerged as a flourishing commercial, artistic, and scientific center. Its population of about a million people created a huge demand for goods and services, and Baghdad became an entrepôt (trading center) for textiles, slaves, and foodstuffs coming from Oman, East Africa, and India. The city also became intellectually influential. Harun al-Rashid organized the translation of Greek medical and philosophical texts. As part of this effort the Christian scholar Hunayn Ibn Ishaq (808–873) translated Galen’s medical works into Arabic and made Baghdad a center for the study and practice of medicine. Likewise, impetus was given to the study of astronomy, as Muslim astronomers sought to correct and complement Ptolemaic astronomy. Above all, studies in Qur’anic textual analysis, history, poetry, law, and philosophy — all in Arabic — reflected the development of a distinctly Islamic literary and scientific culture.

An important innovation of the Abbasids was the use of slaves as soldiers. The caliph al-Mu’taşim (r. 833– 842) acquired several thousand Turkish slaves who were converted to Islam and employed in military service. Scholars have offered varied explanations for this practice: that the use of slave soldiers was a response to a manpower shortage; that as highly skilled horsemen, the Turks had military skills superior to those of the Arabs and other peoples; and that al-Mu’taşim felt he could trust the Turks more than the Arabs, Persians, Khurasans, and other recruits. In any case, slave soldiers — later including Slavs, Indians, and sub-Saharan blacks — became a standard feature of Muslim armies in the Middle East until the twentieth century.

Administration of the Islamic Territories

The Islamic conquests brought into being a new imperial system. At the head stood the caliph, who led military campaigns against unbelievers. Theoretically, he had the ultimate responsibility for the interpretation of the sacred law. In practice, however, the ulama interpreted the law as revealed in the Qur’an and the Sunna. In the course of time, the ulama’s interpretations constituted a rich body of law, the **shari’a** (shuh-REE-uh), which covered social, criminal, political, commercial, and religious matters. The *qadis* (KAH-dees), or judges, who were well versed in the sacred law, carried out the judicial functions of the state. Nevertheless, Muslim law prescribed that all people have access to the caliph, and he set aside special times for hearing petitions and for directly redressing grievances.

shari’a Muslim law, which covers social, criminal, political, commercial, and religious matters.

The central administrative organ was the diwān, which collected the taxes that paid soldiers’ salaries and financed charitable and public works, such as aid to the poor and the construction of mosques, irrigation works, and public baths. Another important undertaking was a relay network established to rapidly convey letters and intelligence reports between the capital and distant outposts.

The early Abbasid period witnessed considerable economic expansion and population growth, complicating the work of government. New and specialized departments emerged, each with a hierarchy of officials. The most important new official was the vizier (vuh-ZEER), a position that the Abbasids adopted from the Persians. The vizier was the caliph’s chief assistant. Depending on the caliph’s personality, viziers could acquire extensive power, and some used their offices for personal gain. Away from the capital **emirs**, or governors, were given overall responsibility for public order, maintenance of the armed forces, and tax collection. Below them, experienced native officials often remained in office.

Fragmentation and Military Challenges, 900–1400

How were the Islamic lands governed from 900 to 1400, and what new challenges did rulers face?

In theory, the caliph and his central administration governed the whole empire, but in practice, the many parts of the empire enjoyed considerable local independence. At the same time, the enormous distance between many provinces and the imperial capital made it difficult for the caliph to prevent provinces from breaking away. Consequently, regional dynasties emerged in much of the Islamic world, including Spain, Persia, Central Asia, northern India, and Egypt. None of these states repudiated Islam, but they did stop sending tax revenues to Baghdad. Moreover, states frequently fought costly wars against their neighbors in their attempts to expand. Sometimes these conflicts were worsened by Sunni-Shi'a antagonisms. All these developments, as well as invasions by Turks and Mongols, posed challenges to central Muslim authority.

Breakaway Territories and Shi'a Gains

One of the first territories to break away from the Baghdad-centered caliphate was Spain. In 755 an Umayyad prince who had escaped death at the hands of the Abbasids and fled to Spain set up an independent regime at Córdoba (see Map 9.1). Other territories soon followed. In 800 the emir in Tunisia in North Africa set himself up as an independent ruler and refused to place the caliph's name on the local coinage. And in 820 Tahir, the son of a slave, was rewarded with the governorship of Khurasan because he had supported the caliphate. Once he took office, Tahir ruled independently of Baghdad.

In 946 a Shi’a Iranian clan overran Iraq and occupied Baghdad. The caliph was forced to recognize the clan’s leader as commander in chief and to allow the celebration of Shi’a festivals — though the caliph and most of the people were Sunnis. A year later the caliph was accused of plotting against his new masters, snatched from his throne, dragged through the streets, and blinded. Blinding was a practice adopted from the Byzantines as a way of rendering a ruler incapable of carrying out his duties. This incident marked the practical collapse of the Abbasid caliphate. Abbasid caliphs, however, remained as puppets of a series of military commanders and symbols of Muslim unity until the Mongols killed the last Abbasid caliph in 1258 (see “The Mongol Invasions”).

The Fatimid Caliphate, 909–1171

In another Shi'a advance, the Fatimids, a Shi'a dynasty that claimed descent from Muhammad's daughter Fatima, conquered North Africa and then expanded into the Abbasid province of Egypt, founding the city of Cairo as their capital in 969. For the next century or so, Shi'a were in ascendancy in much of the western Islamic world.

The Ascendancy of the Turks

In the mid-tenth century the Turks began to enter the Islamic world in large numbers. First appearing in Mongolia in the sixth century, groups of Turks, such as the Seljuks, gradually appeared across the grasslands of Eurasia. Skilled horsemen, they became prime targets for Muslim slave raids, as they made good slave soldiers. Once the Turks understood that Muslims could not be captured for slaves, more and more of them converted to Sunni Islam and often became *ghazi*, frontier raiders, who attacked unconverted Turks to capture slaves.

In the 1020s and 1030s Seljuk Turks overran Persia and then pushed into Iraq and Syria. Baghdad fell to them on December 18, 1055, and the caliph became a puppet of the Turkish sultan. The Turkish elite rapidly gave up pastoralism and took up the sedentary lifestyle of the people they governed.

The Turks brought badly needed military strength to the Islamic world. They played a major part in recovering Jerusalem after it was held for nearly a century, from 1099 to 1187, by the European Crusaders (who had fought to take Christian holy lands back from the Muslims; see "The Course of the Crusades" in Chapter 14). The influx of Turks from 950 to

1100 also helped provide a new expansive dynamic. At the Battle of Manzikert in 1071, Seljuk Turks broke through Byzantine border defenses, opening Anatolia to Turkish migration. Over the next couple of centuries, perhaps a million Turks entered the area — including bands of ghazis and dervishes (Sufi brotherhoods; see “The Mystical Tradition of Sufism”).

The Mongol Invasions

In the early thirteenth century the Mongols arrived in the Middle East. Originally from the grasslands of Mongolia, in 1206 they proclaimed Chinggis Khan (ca. 1162–1227) as their leader, and he welded Mongol, Tartar, and Turkish tribes into a strong confederation that rapidly subdued neighboring settled societies (see “Chinggis Khan and the Mongol Empire” in Chapter 12).

In 1219–1221, when the Mongols first reached the Islamic lands, the areas from Persia through the Central Asian cities of Herat and Samarkand were part of the kingdom of Khwarizm. The ruler — the son of a Turkish slave who had risen to governor of a province — had the audacity to execute Chinggis’s envoy, and Chinggis retaliated with a force of a hundred thousand soldiers that sacked city after city, often slaughtering the residents or enslaving them and sending them to Mongolia. Millions are said to have died. The irrigation systems that were needed for agriculture in this dry region had been neglected for some time, and with the Mongol invasions they suffered a fatal blow.

Not many Mongol forces were left in Persia after the campaign of 1219–1221, and another army, sent in 1237, captured the Persian city of Isfahan. In 1251 the decision was taken to push farther west, taking Baghdad in 1258 and killing the last Abbasid caliph. Mamluk soldiers from Egypt, however, were able to withstand the Mongols and prevent them from taking Egypt and the Islamic lands in North Africa. The desert ecology of the region did not provide suitable support for the Mongol armies, which required five horses for each soldier.

The Mongols ruled the central Muslim lands (referred to as the Il-khanate) for eighty years. In 1295 the Mongol ruler Ghazan embraced Islam and worked for the revival of Muslim culture. As the Turks had done earlier, the Mongols, once converted, injected new vigor into the faith and spirit of Islam. In the Il-khanate the Mongols governed through Persian viziers and native financial officials.

Muslim Society: The Life of the People

What social distinctions were important in Muslim society?

When the Prophet appeared, Arab society consisted of independent Bedouin tribal groups loosely held together by loyalty to a strong leader and by the belief that all members of a tribe were descended from a common ancestor. Heads of families elected the sheik, or tribal chief. He was usually chosen from among elite warrior families who believed their bloodlines made them superior. According to the Qur'an, however, birth counted for nothing; piety was the only criterion for honor.

When Muhammad defined social equality, he was thinking about equality among Muslims alone. But even among Muslims, a sense of pride in ancestry could not be instantly eradicated. Claims based on birth remained strong among the first Muslims, and after Islam spread outside of Arabia, full-blooded Arab tribesmen regarded themselves as superior to foreign converts.

Women in a Persian Garden These twelfth-century wall tiles depict four women amid trees in a garden. They come from Isfahan, which was then the leading city in Persia.

The Social Hierarchy

In the Umayyad period, Muslim society was distinctly hierarchical. At the top of the hierarchy were the caliph’s household and the ruling Arab Muslims who constituted the ruling elite. It was a relatively small group, greatly outnumbered by Muslim villagers and country people.

Converts constituted the second class in Islamic society, one that grew slowly over time. Converts to Islam had to attach themselves to one of the Arab tribes in a subordinate capacity. From the Muslim converts eventually came the members of the commercial and learned professions — merchants, traders, teachers, doctors, artists, and interpreters of the shari’a. Over the centuries, Berber, Copt, Persian, Aramaean, and other converts to Islam intermarried with their Muslim conquerors. Gradually, assimilation united peoples of various ethnic backgrounds.

Dhimmis (zih-MEEZ) — including Jews, Christians, and Zoroastrians — formed the third stratum. Considered “protected peoples” because they worshipped only one God, they were allowed to practice their religions, maintain their houses of worship, and conduct their business affairs as long as they gave unequivocal recognition to Muslim political supremacy and paid a small tax. Because many Jews and Christians were well educated, they were often appointed to high positions in provincial capitals as well as in Damascus and Baghdad. However, their social position deteriorated during the Crusades and the Mongol invasions, when there was a general rise of religious loyalties. At those times, Muslims suspected the dhimmis, often rightly, of collaborating with the enemies of Islam.

dhimmis A term meaning “protected peoples”; they included Jews, Christians, and Zoroastrians.

How did the experience of Jews under Islam compare with that of Jews living in Christian Europe? Recent scholarship shows that in Europe Jews were first marginalized in the Christian social order and then completely expelled from it. In Islam Jews, though marginalized, participated fully in commercial and professional activities, some attaining economic equality with their Muslim counterparts. Islamic culture was urban and commercial and gave merchants considerable respect.

Slavery

Slavery had long existed in the ancient Middle East, and Muslim expansion ensured a steady flow of slaves captured in war. The Qur’an accepted slavery much the way the Old and New Testaments did. But the

Qur’an prescribes just and humane treatment of slaves, explicitly encourages the freeing of slaves, and urges owners whose slaves ask for their freedom to give them the opportunity to buy it. In fact, the freeing of slaves was thought to pave the way to paradise.

Women slaves worked as cooks, cleaners, laundresses, and nursemaids. A few performed as singers, musicians, dancers, and reciters of poetry. Many female slaves also served as concubines. Not only rulers but also high officials and rich merchants owned many concubines. Down the economic ladder, artisans and tradesmen often had concubines who assumed domestic as well as sexual duties.

According to tradition, the seclusion of women in a harem protected their virtue, and when men had the means the harem was secured by eunuch (castrated) guards. Muslims also employed eunuchs as secretaries, tutors, and commercial agents, possibly because eunuchs were said to be more manageable and dependable than men with ordinary desires. Male slaves, eunuchs or not, were also set to work as longshoremen on the docks, as oarsmen on ships, in construction crews, in workshops, and in gold and silver mines. Male slaves also fought as soldiers.

Slavery in the Islamic world differed in at least two fundamental ways from the slavery later practiced in the Americas. First, race had no particular connection to slavery among Muslims, who were as ready to take slaves from Europe as from Africa. Second, slavery in the Islamic world was not the basis for plantation agriculture, as it was in the southern United States, the Caribbean, and Brazil in the eighteenth and nineteenth centuries. Slavery was rarely hereditary in the Islamic world. Most slaves who were taken from non-Muslim peoples later converted, which often led to emancipation. To give Muslim slavery the most positive possible interpretation, one could say that it provided a means to fill certain socioeconomic and military needs and that it assimilated rather than segregated outsiders.

Women in Classical Islamic Society

Before Islam, Arab tribal law gave women virtually no legal powers. Parents accepted payments for their daughters, and their husbands could terminate the union at will. Also, women had virtually no property or succession rights. Seen from this perspective, the Qur’an sought to improve the social position of women.

The Qur’an, like the religious scriptures of other traditions, emphasizes moral precepts, not descriptions of social practice, and the text is open to different interpretations. Modern scholars tend to agree that the Islamic sacred book intended women to be the spiritual equals of men and gave them considerable economic rights. In the early Umayyad period, moreover, women played active roles in the religious, economic, and political life of the community. They owned property, traveled widely, and participated with men in public religious rituals and observances.

The Islamic ideal of women and men having equal value to the community did not last. In the Abbasid period the practices of the Byzantine and Persian lands that had been conquered, including seclusion of women, were absorbed. The supply of slave women increased substantially. Some scholars speculate that as wealth replaced ancestry as the main criterion of social status, men more and more viewed women as possessions, as a form of wealth. As society changed, the precepts of the Qur’an were interpreted in more patriarchal ways. (See “Analyzing the Evidence: Abu Hamid al-Ghazali on the Etiquette of Marriage,” page 241.)

Separating Men and Women in a Mosque In this mid-sixteenth-century illustration of the interior of a mosque, a screen separates the women, who are wearing veils and tending children, from the men. The women can hear what is being said, but the men cannot see them.

Men were also seen as dominant in their marriages. The Qur’an states that “men are in charge of women because Allah hath made the one to excel the other, and because they (men) spend of their property (for the support of women). So good women are obedient, guarding in secret that which Allah hath guarded.”[1] A thirteenth-century commentator on this passage argued from it that women are incapable of and unfit for any public duties, such as participating in religious rites, giving evidence in the law courts, or being involved in any public political decisions.

The practices of veiling and seclusion of women have their roots in pre-Islamic times, and they took firm hold in classical Islamic society. As Arab conquerors subjugated various peoples, they adopted some of the vanquished peoples’ customs. Veiling was probably of Byzantine or Persian origin. The practice of secluding women also derives from Arab contacts with Persia and other Eastern cultures. By 800 women in more prosperous households stayed out of sight. The harem became another symbol of male prestige and prosperity, as well as a way to distinguish upper-class from lower-class women.

ANALYZING THE EVIDENCE

Abu Hamid al-Ghazali on the Etiquette of Marriage

Abu Hamid al-Ghazali (1058–1111) was a Persian philosopher, theologian, jurist, and Sufi, and a prolific author of more than seventy books. His magnum opus, *Revival of the Religious Sciences*, is divided into four parts: *Acts of Worship*, *Norms of Daily Life*, *The Ways to Perdition*, and *The Ways of Salvation*. The passages on marriage presented here are only a small part of *Norms of Daily Life*, a lengthy treatise full of quotations from the Qur’an and traditions about the words and actions of Muhammad. His writings reflect the trend toward more patriarchal readings of Muslim teachings.

■ Marriage confers five benefits: a) children; b) the stilling of passion; c) good housekeeping; d) extended family ties; e) spiritual training through coping with all the foregoing.

The begetting of children … is the essential basis upon which marriage was instituted, the purpose being continuance of procreation so that the world should never be devoid of humankind….

For the sake of inner tranquility, it is permissible to avert the danger of fornication by marrying a slave-girl — despite the consequence that any offspring will carry slave status, which is a kind of perdition. Because of this, such marriage is forbidden to anyone who can afford to marry a free woman.

Nevertheless, slavery for the children is less grave than the ruination of faith. The child suffers only temporary annoyance in this life, whereas the abominable sin of fornication causes loss of the Life Hereafter….

When a man’s nature is so dominated by sexual desire that one wife alone would not suffice to keep him chaste, it is recommended that he take more than one (up to a maximum of four). All is then well, provided he enjoys the love and mercy of Allah and feels inwardly content with these wives. Otherwise, substitution is recommended….

[The fourth advantage of marriage is] freedom from concern with running the household (and all the chores of cooking, making beds, cleaning dishes and preparing meals)….

Ali used to say: “Three vices in a man are virtues in a woman: stinginess, vanity and timidity.”

(If a woman is stingy, she will safeguard her own property and that of her husband. If she is vain, she will not condescend to engage in suspiciously tender conversation with just anybody. If she is timid, she will be scared of everything; she will not venture out of her house, and will avoid dubious places from fear of her husband.) …

Certain very pious men would only give their daughters in marriage if they had first been seen by their prospective husbands, as a precaution against illusion. Al-A'mash said: "Every marriage that takes place without sight of the bride ends in sorrow and grief." Of course, everyone knows that visual inspection tells nothing about character, religion, or wealth, but serves only to distinguish beauty from ugliness….

As Allah's Messenger once said: "The best of wives are those with the prettiest faces, and whose dowers [dowries] are least expensive." He even forbade the giving of excessive dower….

The marriage guardian also has a duty to consider the qualities of the prospective husband. He should look to the interest of his precious one, and not give her in marriage to a man of poor physique or bad character, or who will fail to give her all her due, or who is not her equal in lineage. The Prophet said: "Marriage is a kind of servitude, so let each of you look to where he is placing his precious daughter." …

Allah's blessed Messenger asked his daughter Fatima: "What is best for a woman?" — "That she should not see a man, nor any man see her," she replied, whereupon he hugged her and said: "That's my daughter!" Thus did he show approval of her words….

If a man has several wives, he must treat them equally and not favor any of them. If he is going away on a journey and wants to take one of them along for company, he should draw lots among them. That is what Allah's Messenger used to do. If he robs a wife of her night, he should make it up to her, as a religious duty….

The husband should begin with gentle coaxing and kissing. The Prophet once said: "Let none of you fall upon his wife as an animal would do. Let there be an envoy between them." When they asked: "What is this envoy, O Messenger of Allah?" he replied: "Kisses and sweet words." …

A man should not be too overjoyed at getting a boy, nor unduly sad at getting a girl, for he is not to know which of them will prove the greater blessing to him. How many fathers of sons wish they had none at all, or girls instead! Indeed, girls give more peace, and the reward they bring is more bountiful….

Divorce is permissible, but it is the most hateful to Allah.

QUESTIONS FOR ANALYSIS

1. Describe al-Ghazali's assessment of the benefits of marriage.
2. In what ways are the views toward marriage and gender expressed by al-Ghazali similar to those seen in other traditions?

Marriage, the Family, and Sexuality

As in medieval Europe and traditional India and China, marriage in Muslim society was considered too important an undertaking to be left to the romantic emotions of the young. Families or guardians, not the prospective bride and groom, identified suitable partners and finalized the contract. Because it was absolutely essential that the bride be a virgin, marriages were arranged shortly after puberty. Husbands were commonly ten to fifteen years older. Youthful marriages ensured a long period of fertility.

A wife's responsibilities depended on the wealth and occupation of her husband. A farmer's wife helped in the fields, ground the corn, carried water, prepared food, and did the myriad tasks necessary in rural life. Shopkeepers' wives in the cities sometimes helped in business. In an upper-class household, the wife supervised servants, looked after all domestic arrangements, and did whatever was needed for her husband's comfort.

In every case, children were the wife's special domain. A mother exercised authority over her children and enjoyed their respect. A Muslim tradition asserts that "paradise is at the mother's feet." Thus, as in Chinese culture, the prestige of the young wife depended on the production of children — especially sons — as rapidly as possible. A wife's failure to have children was one of the main reasons for a man to divorce his wife or take a second wife.

Like the Jewish tradition, Muslim law permits divorce. Although divorce is allowed, it is not encouraged. One commentator cited the Prophet as saying, "The lawful thing which God hates most is divorce."[2]

In contrast to the traditional Christian view of sexual activity as inherently shameful and only a cure for lust even within marriage, Islam maintains a healthy acceptance of sexual pleasure for both males and females. The Qur'an permits a man to have four wives, provided that all are treated justly. Still, the vast majority of Muslim males were monogamous because only the wealthy could afford to support more than one wife.

Trade and Commerce

Why did trade thrive in Islamic lands?

Unlike the Christian West or the Confucian East, the Islamic world looked favorably on profit-making enterprises. According to the sayings of the Prophet: “The honest, truthful Muslim merchant will stand with the martyrs on the Day of Judgment. I commend the merchants to you, for they are the couriers of the horizons and God’s trusted servants on earth.”[3] The Qur’an, moreover, has no prohibition against trade with Christians or other unbelievers. In fact, non-Muslims, including the Jews of Cairo and the Armenians in the central Islamic lands, were prominent in mercantile networks.

Waterways served as the main commercial routes of the Islamic world (Map 9.2). They included the Mediterranean and Black Seas; the Caspian Sea and the Volga River, which gave access deep into Russia; the Aral Sea, from which caravans departed for China; the Gulf of Aden; and the Arabian Sea and the Indian Ocean, which linked the Persian Gulf region with eastern Africa, the Indian subcontinent, and eventually Indonesia and the Philippines. MAP 9.2 The Expansion of Islam and Its Trading Networks in the Thirteenth and Fourteenth Centuries By 1500 Islam had spread extensively in North and East Africa, and into the Balkans, the Caucasus, Central Asia, India, and the islands of Southeast Asia. Muslim merchants played a major role in bringing their religion as they extended their trade networks. They were active in the Indian Ocean long before the arrival of Europeans.

Cairo was a major Mediterranean entrepôt for intercontinental trade. Foreign merchants sailed up the Nile to the Aswan region, traveled east from Aswan by caravan to the Red Sea, and then sailed down the Red Sea to Aden, where they entered the Indian Ocean on their way to India. They exchanged textiles, glass, gold, silver, and copper for Asian spices, dyes, and drugs and for Chinese silks and porcelains. Muslim and Jewish merchants dominated the trade with India, and all spoke and wrote Arabic. Their commercial practices included the *sakk* (the Arabic word is the root of the English *check*), an order to a banker to pay money held on account to a third party. Muslims also developed other business innovations, such as the bill of exchange, a written order from one person to another to pay a specified sum of money to a designated person or party, and the idea of the joint stock company, an arrangement that lets a group of people invest in a venture and share its profits (and losses) in proportion to the amount each has invested.

Trade also benefited from improvements in technology. The adoption from the Chinese of the magnetic compass, an instrument for determining directions at sea by means of a magnetic needle turning on a pivot, greatly helped navigation of the Arabian Sea and the Indian Ocean. The construction of larger ships led to a shift in long-distance cargoes from luxury goods such as pepper, spices, and drugs to bulk goods such as sugar, rice, and timber. The teak forests of western India supplied the wood for Arab ships.

Beginning in the late twelfth century Persian and Arab seamen sailed down the east coast of Africa and established trading towns between Somalia and Sofala (see “The East African City-States” in Chapter 10). These thirty to fifty urban centers controlled by merchants linked Zimbabwe in southern Africa with the Indian Ocean trade and the Middle Eastern trade.

A private ninth-century list mentions a great variety of commodities transported into and through the Islamic world by land and by sea:

> Imported from India: tigers, leopards, elephants, leopard skins, red rubies, white sandal-wood, ebony, and coconuts
> From China: aromatics, silk, porcelain, paper, ink, peacocks, fiery horses, saddles, felts, cinnamon
> From the Byzantines: silver and gold vessels, embroidered cloths, fiery horses, slave girls, rare articles in red copper, strong locks, lyres, water engineers, specialists in plowing and cultivation, marble workers, and eunuchs
> From Egypt: ambling donkeys, fine cloths, papyrus, balsam oil, and, from its mines, high-quality topaz
> From the Khazars [a people living on the northern shore of the Black Sea]: slaves, slave women, armor, helmets, and hoods of mail
> From Ahwaz [a city in southwestern Persia]: sugar, silk brocades, castanet players and dancing girls, kinds of dates, grape molasses, and candy.[4]

One byproduct of the extensive trade through Islamic lands was the spread of useful plants. Cotton, sugarcane, and rice spread from India to other places with suitable climates. Citrus fruits made their way to Muslim Spain from Southeast Asia and India. The value of this trade contributed to the prosperity of the Abbasid era.

THINKING LIKE A HISTORIAN

The Risks and Rewards of Indian Ocean Seaborne Trade

During the centuries when Islam spread, Arab and Persian merchants were very active as traders in the Indian Ocean. Wares and products from India and China were in high demand, and they were shipped in stages through a series of exchanges at intermediary ports. Traveler accounts and shipwreck discoveries illuminate this trade.

1 **Sulayman the Merchant on travel to India and China, 851.** The man known as Sulayman the Merchant made numerous voyages to India and China from the coast of Persia. He wrote about his many daring voyages, describing the piracy and extreme weather en route to China and the life of foreign traders there.

■ The goods of China are rare; and among the causes of their rarity is the frequent outbreak of fires at Khanfu [Guangzhou], the port for ships and the entrepôt [trading center] for merchandise of the Arabs and the Chinese…. Another cause is that the ships are sometimes wrecked on the way out or on the way back, or plundered, or forced to make long stops and sell their goods in non-Arab countries. Sometimes, too, the wind throws them on to al-Yaman or other places and they sell their goods there; sometimes they make a long stop to repair their ships; and so on.

2 **Al-Muqaddasi, *Geography*, 986.** A native of Jerusalem, al-Muqaddasi was an Arab geographer who took many journeys to learn about distant regions while preparing his geographical treatise.

■ I, myself, have travelled a course of about two thousand leagues…. I was thus thrown into the company of men — shipmasters, pilots, agents and merchants — who, bred and born upon it, possessed the clearest and fullest knowledge of this sea, its anchorages, its winds and its islands. I plied them with questions concerning its position, physical peculiarities and its limits. I have also seen in their possession charts and sailing directories which they constantly study and follow with implicit confidence….

Suhar is … a flourishing and populous city, and a beautiful, pleasant and lovely place. It is also a city of wealthy and many merchants…. It contains excellent markets and is beautifully laid out along the shore of the sea. Its lofty and splendid houses are built of burned bricks and teak-wood…. Suhar is the gateway of China, and the emporium of the East and al-Iraq…. The Persians are masters in it.

3 **Reconstruction of the Belitung ship.** A ninth-century Arab or Persian ship that sank in Indonesian waters on its way from China to the Middle East was discovered in 1998. The Belitung ship was 70 feet long and 16 feet wide. Constructed in the Middle East,

the ship was made of mostly African hardwood and was sewn together with coconut fiber. This replica was created using the technology and materials of the time, including African timber and sails of woven palm leaves. Named *Jewel of Muscat,* when it was finally completed a crew sailed the ship from Oman to Singapore, taking five months and stopping several times.

4 **Pottery recovered from the ninth-century Belitung shipwreck.** The bulk of the cargo consisted of mass-produced Chinese ceramics, including 40,000 bowls, 1,635 ewers, 763 inkpots, and 915 spice jars. The cargo also included exquisite silver boxes, silver ingots, star anise, and an octagonal gold cup decorated with Central Asian figures. A tiny sample of the recovered ceramics can be seen in this photo.

5 **Marco Polo, *Description of the World,* ca. 1300.** Marco Polo's return trip from China to Italy in 1295 involved traveling by ship through Southeast Asia, with stops in India and other places. Here he discusses the situation on the west coast of India.

■ You must know that from Malabar, and from a neighbouring province called Gujarat, more than 100 ships cruise out every year as corsairs, seizing other ships and robbing the merchants. For they are pirates on a big scale…. But the merchants, who are quite familiar with the habits of these villainous corsairs and know that they are sure to encounter them, go so well armed and equipped that they are not afraid to face them after they have been detected. They defend themselves stoutly and inflict great damage on their attackers. But of course it is inevitable that one should be captured now and then. When the corsairs do capture a merchant ship, they help themselves to the ship and the cargo; but they do not hurt the men. They say to them: "Go and fetch another cargo. Then, with luck, you may give us some more."

6 **Tenth-century Middle Eastern glassware from the Cirebon wreck.** In 2003, not far from where the Belitung wreck was found, another ship was discovered, dating to about a century later and possibly constructed in Southeast Asia. Like the Belitung ship, it was constructed by lashing boards together. It carried ceramics from Thailand, Vietnam, Persia, and China as well as Chinese bronze mirrors, Indonesian bronze statues, Middle Eastern glass vessels, pearls, rubies, sapphires, garnets, gold jewelry, Fatimid rock crystal, Iranian glassware, and two tons of lapis lazuli. The glassware shown here came from Egypt, Iran, and Mesopotamia.

ANALYZING THE EVIDENCE

1. Do the authors of the texts in Sources 1, 2, and 5 seem well informed? What is your evidence?
2. Given the dates of Sources 1, 2, and 5, do you think trade conditions changed much over these centuries?
3. Does the evidence concerning the shipwrecks in Sources 3, 4, and 6 tend to support or undermine the written evidence in Sources 1, 2, and 5?
4. Why might a ship, such as the one that held the glassware in Source 6, carry items

from many different places?

PUTTING IT ALL TOGETHER

Using the sources above, along with what you have learned in class and in this chapter, write a short essay on maritime trade in the Indian Ocean between 800 and 1400 and its historical significance. What connections were there between the travels of Muslim merchants and the spread of Islam?

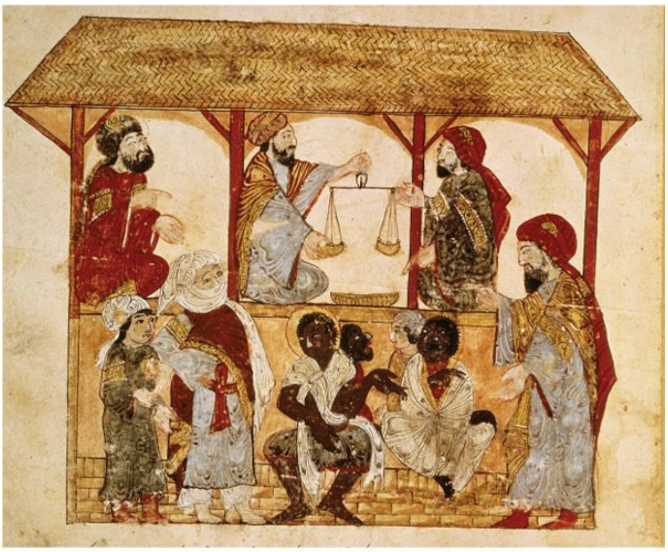
Cultural Developments

What new ideas and practices emerged in the arts, sciences, education, and religion?

Long-distance trade provided the wealth that made possible a gracious and sophisticated culture in the cities of the Islamic world. (See “Individuals in Society: Ibn Battuta,” at right.) Education helped foster achievements in the arts and sciences, and Sufism brought a new spiritual and intellectual tradition.

INDIVIDUALS IN SOCIETY

Ibn Battuta



Bibliothèque Nationale, Paris, France/Art Resource, NY

Travelers to Baghdad would have seen slave markets like this one.

IN 1354 THE SULTAN OF MOROCCO APPOINTED A SCRIBE to write an account of the travels of Abu ’Abdallah Ibn Battuta (1304–1368), who between 1325 and 1354 had traveled through most of the Islamic world. The two men collaborated. The result was a travel book written in Arabic and later hailed as the richest eyewitness account of fourteenth-century Islamic culture.

Ibn Battuta was born in Tangiers to a family of legal scholars. As a youth, he studied Muslim law, gained fluency in Arabic, and acquired the qualities considered essential for a civilized Muslim gentleman: courtesy, manners, and the social polish that eases relations among people.

At age twenty-one he left Tangiers to make the hajj (pilgrimage) to Mecca. He crossed North Africa and visited Alexandria, Cairo, Damascus, and Medina. Reaching Mecca in October 1326, he immediately praised God for his safe journey, kissed the Holy Stone at the Ka’ba, and recited the ritual prayers. There he decided to see more of the world.

In the next four years Ibn Battuta traveled to Iraq and to Basra and Baghdad in Persia, then returned to Mecca before sailing down the coast of Africa as far as modern Tanzania. On the return voyage he visited

Oman and the Persian Gulf region, then traveled by land across central Arabia to Mecca. Strengthened by his stay in the holy city, he decided to go to India by way of Egypt, Syria, and Anatolia; across the Black Sea to the plains of western Central Asia, detouring to see Constantinople; back to the Asian steppe; east to Khurasan and Afghanistan; and down to Delhi in northern India.

For eight years Ibn Battuta served as a judge in the service of the sultan of Delhi. In 1341 the sultan chose him to lead a diplomatic mission to China. After the expedition was shipwrecked off the southeastern coast of India, Ibn Battuta traveled through southern India, Sri Lanka, and the Maldive Islands. Then he went to China, stopping in Bengal and Sumatra before reaching the southern coast of China, then under Mongol rule. Returning to Mecca in 1346, he set off for home, getting to Morocco in 1349. After a brief trip across the Strait of Gibraltar to Granada, he undertook his last journey, by camel caravan across the Sahara to Mali in the West African Sudan (see “The Kingdom of Mali, ca. 1200–1450” in Chapter 10), returning home in 1354. Scholars estimate that he had traveled about seventy-five thousand miles.

Ibn Battuta had a driving intellectual curiosity to see and understand the world. At every stop, he sought the learned jurists and pious men at the mosques and madrasas. He marveled at the Lighthouse of Alexandria, then in ruins; at the vast harbor at Kaffa (in southern Ukraine on the Black Sea), whose two hundred Genoese ships were loaded with silks and slaves for the markets at Venice, Cairo, and Damascus; and at the elephants in the sultan’s procession in Delhi, which carried machines that tossed gold and silver coins to the crowds.

Ibn Battuta must have had an iron constitution. He endured fevers, dysentery, malaria, the scorching heat of the Sahara, and the freezing cold of the steppe. His thirst for adventure was stronger than his fear of nomadic warriors and bandits on land and the dangers of storms and pirates at sea.

QUESTIONS FOR ANALYSIS

1. Trace the routes of Ibn Battuta’s travels on Map 9.2.
2. How did a common Muslim culture facilitate Ibn Battuta’s travels?

The Cultural Centers of Baghdad and Córdoba

Although cities and mercantile centers dotted the entire Islamic world, the cities of Baghdad and Córdoba, at their peak in the tenth century, stand out as the finest examples of cosmopolitan Muslim civilization. On Baghdad's streets thronged a kaleidoscope of races, creeds, costumes, and cultures. Shops and marketplaces offered a dazzling and exotic array of goods from all over the world.

The caliph Harun al-Rashid presided over a glamorous court. He invited writers, dancers, musicians, poets, and artists to live in Baghdad, and he is reputed to have rewarded one singer with one hundred thousand silver pieces for a single song. This brilliant era provided the background for the tales that appear in *The Thousand and One Nights*.

The central story of this fictional collection concerns the attempt of a new bride, Scheherazade, to keep her husband, Shahyar, legendary king of Samarkand, from killing her out of certainty that she will be unfaithful like his first wife. In efforts to delay her execution, she entertains him with one tale a night for 1,001 nights. In the end, Scheherazade's efforts succeed, and her husband pardons her. Among the tales she tells him are such famous ones as "Aladdin and His Lamp," "Sinbad the Sailor," and "Ali Baba and the Forty Thieves." Though filled with folklore, the *Arabian Nights* (as it is also called) has provided many of the images through which Europeans have understood the Islamic world.

Córdoba in southern Spain competed with Baghdad for the cultural leadership of the Islamic world. With a population of about 1 million, Córdoba contained 1,600 mosques, 900 public baths, 213,177 houses for ordinary people, and 60,000 mansions for generals, officials, and the wealthy. In its 80,455 shops, 13,000 weavers produced silks, woolens, and brocades that were internationally famous. Córdoba was also a great educational center with 27 free schools and a library containing 400,000 volumes. (By contrast, the renowned Benedictine abbey of Saint-Gall in Switzerland had about 600 books.) Moreover, Córdoba's scholars made contributions in chemistry, medicine and surgery, music, philosophy, and mathematics. It was through Córdoba and Persia that the Indian game of chess entered western Europe. The contemporary Saxon nun Hrosthwita of Gandersheim (d. 1000) described Córdoba as the "ornament of the world."[5]

Education and Intellectual Life

Muslim culture valued learning, especially religious learning, because knowledge provided the guidelines by which men and women should live. From the eighth century onward, formal education for young men involved reading, writing, and the study of the Qur'an, believed essential for its religious message and for its training in proper grammar and syntax.

Islam is a religion of the law, taught at **madrasas** (muh-DRA-suhs), schools for the study of Muslim law and religion. Schools were urban phenomena. Wealthy merchants endowed them, providing salaries for teachers, stipends for students, and living accommodations for both. All Islamic higher education rested on a close relationship between teacher and students, so in selecting a teacher, the student (or his father) considered the character and intellectual reputation of the teacher, not that of the institution. Students built their subsequent careers on the reputation of their teachers.

madrasa A school for the study of Muslim law and religion.

Learning depended heavily on memorization. In primary school a boy began his education by memorizing the entire Qur'an. In adolescence a student learned by heart an introductory work in one of the branches of knowledge, such as jurisprudence or grammar. Later he analyzed the texts in detail. Every class day, the teacher examined the student on the previous day's learning and determined whether the student fully understood what he had memorized. Students, of course, learned to write, for they had to record the teacher's commentary on a particular text. But the overwhelming emphasis was on the oral transmission of knowledge.

Because Islamic education focused on particular books, when the student had mastered a text to his teacher's satisfaction, the teacher issued the student a certificate stating that he had studied the book or collection of traditions with his teacher. The certificate allowed the student to transmit a text to the next generation on the authority of his teacher.

As the importance of books suggests, the Muslim transmission and improvement of papermaking techniques had special significance to education. After Chinese papermaking techniques spread westward, Muslim papermakers improved on them by adding starch to fill the pores in the surfaces of the sheets. Even before the invention of printing, papermaking had a revolutionary impact on the collection and diffusion of knowledge.

Muslim higher education, apart from its fundamental goal of preparing men to live wisely and in accordance with God's law, aimed at preparing them to perform religious and legal functions as Qur'an — or hadith — readers; as preachers in the mosques; as professors, educators, or copyists; and especially as judges. Judges issued fatwas, or legal opinions, in the public courts; their training was in the Qur'an, hadith, or some text forming part of the shari'a.

On the issue of female education, Islamic culture was ambivalent. Tradition holds that Muhammad said, "The seeking of knowledge is a duty of every Muslim," but, because of the basic Islamic principle that "men are the guardians of women, because God has set the one over the other," the law excluded women from participating in the legal, religious, or civic occupations for which the madrasa prepared young men. Moreover, educational theorists insisted that men should study in a sexually isolated environment. Nevertheless, many young women were educated at home. According to one biographical dictionary covering the lives of 1,075 women, 411 of them had memorized the Qur'an, studied with a particular teacher, and received a certificate.

In comparing Islamic higher education during the twelfth through fourteenth centuries with that available in Europe or China at the same time (see "The Scholar-Officials and Neo-Confucianism" in Chapter 13 and "Universities and Scholasticism" in Chapter 14), there are some striking similarities and some major differences. In both Europe and the Islamic countries religious authorities ran most schools, while in China the government, local villages, and lineages ran schools, and private tutoring was very common. In the Islamic world, as in China, the personal relationship of teacher and student was seen as key to education. In Europe the reward for satisfactorily completing a course of study was a degree granted by the university. In China, at the very highest levels, the state ran a civil service examination system that rewarded achievement with appointments in the state bureaucracy. In Muslim culture, by contrast, it was not the school or the state but the individual teacher whose evaluation mattered and who granted certificates.

Still, there were also some striking similarities in the practice of education. Students in all three cultures had to master a sacred language (Latin, Arabic, or classical Chinese). In all three cultures education rested heavily on the study of basic religious, legal, or philosophical texts. Also, in all three cultures memorization played a large role in the acquisition and transmission of learning. Furthermore, teachers in all three societies lectured on particular passages, and leading teachers might disagree fiercely about the correct interpretations of a particular text, forcing students to question, to think critically, and to choose among divergent opinions. In all three societies these educational practices contributed to cultural cohesion and ties among the educated living in scattered localities.

Teachers Disputing in a Madrasa Although Islamic education relied heavily on memorization of the Qur’an, religious scholars frequently debated the correct interpretation of a particular text. Listening to this lively disputation, the students illustrated in this 1222 book are learning to think critically and creatively.

In the Islamic world the spread of the Arabic language, not only among the educated classes but also among all the people, was the decisive element in the creation of a common culture. Recent scholarship demonstrates that after the establishment of the Islamic empire, the spread of the Arabic language was more important than religion in fostering cultural change. Whereas conversion to Islam was gradual, linguistic conversion occurred much faster. Arabic became the official language of the state and its bureaucracies in former Byzantine and Sassanid territories. Islamic rulers required tribute from monotheistic peoples — the Persians and Greeks — but they did not force them to change their religions. Conquered peoples were, however, compelled to adopt the Arabic language. In time Arabic produced a cohesive and “international” culture over a large part of the Eurasian world. Among those who wrote in Arabic was the erudite Gregory Bar-Hebraeus (1226–1286), a bishop of the Syrian Orthodox Church. He wrote widely on philosophy, poetry, language, history, and theology, sometimes in Syriac, sometimes in

Arabic. (See “Global Viewpoints: Amusing Animal Stories by Syrian and Greek Authors,” page 250).

As a result of Muslim creativity and vitality, modern scholars consider the years from 800 to 1300 to be one of the most brilliant periods in the world’s history. Near the beginning of this period the Persian scholar al-Khwarizmi (d. ca. 850) harmonized Greek and Indian findings to produce astronomical tables that formed the basis for later Eastern and Western research. Al-Khwarizmi also studied mathematics, and his textbook on algebra (from the Arabic *al-jabr*) was the first work in which the word *algebra* is used to mean the “transposing of negative terms in an equation to the opposite side.”

Muslim medical knowledge far surpassed that of the West in this era. The Baghdad physician al-Razi (865–925), the first physician to make the clinical distinction between measles and smallpox, produced an encyclopedic treatise on medicine that was translated into Latin and circulated widely in the West. In Córdoba the great surgeon al-Zahrawi (d. 1013) produced an important work in which he discussed the cauterization of wounds (searing them with a branding iron) and the crushing of stones in the bladder. Muslim science reached its peak in the work of Ibn Sina of Bukhara (980–1037), known in the West as Avicenna. His *al-Qanun* codified all Greco-Arab medical thought, described the contagious nature of tuberculosis and the spreading of diseases, and listed 760 drugs.

Funeral of Isfandyar This page from a fourteenth-century Persian manuscript depicts the funeral procession of the hero Isfandyar. The mourners are wailing and pulling at their hair, which is worn loose as a sign of mourning. The book is the *Shahnama*, or Book of Kings, a sixty-thousand-verse epic telling the story of the Persian empire up to the Islamic conquest in the seventh century. It was completed in 1010 by the poet Ferdowsi.

Muslim scholars also wrote works on geography, jurisprudence, and philosophy. Al-Kindi (d. ca. 870) was the first Muslim thinker to try to harmonize the principles of ethical and social conduct discussed by Plato and Aristotle and the religious precepts of the Qur’an. Inspired by Plato’s *Republic* and Aristotle’s *Politics*, the distinguished philosopher al-Farabi (d. 950) wrote a political treatise describing an ideal city whose ruler is morally and intellectually perfect and who has as his goal the citizens’ complete happiness. Ibn Rushid, or Averroës (1126–1198), of Córdoba, a judge in Seville and later the royal court physician, paraphrased and commented on the works of Aristotle. He insisted on the right to subject all knowledge, except the dogmas of faith, to the test of reason and on the essential harmony of religion and philosophy.

GLOBAL VIEWPOINTS

Amusing Animal Stories by Syrian and Greek Authors

In thirteenth-century Syria, Gregory Bar-Hebraeus wrote not only on serious subjects such as religion and philosophy but also on more playful subjects, and his works include a large collection of amusing stories. Persian, Hebrew, Indian, and Christian wise men appear in these tales, as do animals, clowns, and thieves. The stories that feature talking animals are reminiscent of Aesop's *Fables*, an older set of stories in which animals have distinct humanlike character traits. Aesop's *Fables* can be traced back to Greek and Latin versions, but tales were added over time, so all cannot have been written by the Greek storyteller Aesop. Two of his fables are included here for comparison with Bar-Hebraeus's tales.

Bar-Hebraeus's *Laughable Stories*

■ A wolf, a fox, and a lion having banded themselves together snared a goat, a stag, and a hare. And the lion said to the wolf, "Divide these among us." The wolf said, "The goat is for you, the stag is for me, and the hare is for the fox." When the lion heard these words he became furious and leaped upon the wolf and choked him. Then he said to the fox, "You divide them." The fox said to him, "The goat is for your breakfast, the hare for your lunch, and the stag for your supper." The lion then asked him, "Where have you learned to make such an equitable division?" The fox replied, "From this wolf which lies before you, O my lord the king."

A wolf, a fox, and a hare found a lamb, and they said to each other, "He who is the oldest among us shall eat him." The hare said, "I was born before God created the heavens and the earth," and the fox said, "You are right indeed, for I was present when you were born," and the wolf, at the same time seizing the lamb, said, "My stature and capacity are witnesses that I am older than you both," so he ate the lamb.

Aesop's *Fables*

■ The Birds waged war with the Beasts, and each were by turns the conquerors. A Bat, fearing the uncertain issues of the fight, always fought on the side which he felt was the strongest. When peace was proclaimed, his deceitful conduct was apparent to both combatants. Therefore being condemned by each for his treachery, he was driven forth from the light of day, and henceforth concealed himself in dark hiding-places, flying always alone and at night.

A Wolf, having stolen a lamb from a fold, was carrying him off to his lair. A Lion met him in the path, and seizing the lamb, took it from him.

Standing at a safe distance, the Wolf exclaimed, “You have unrighteously taken that which was mine from me!” To which the Lion jeeringly replied, “It was righteously yours, eh? The gift of a friend?”

QUESTIONS FOR ANALYSIS

1. What makes stories with animal characters interesting?
2. Could Bar-Hebraeus have been inspired by Aesop’s *Fables*? What is your evidence?
3. What are the moral messages in each of these stories, and what can you learn about each culture from these messages?

The Mystical Tradition of Sufism

Like the world's other major religions — Buddhism, Hinduism, Judaism, and Christianity — Islam also developed a mystical tradition: Sufism (SOO-fih-zuhm). It arose in the ninth and tenth centuries as a popular reaction to the materialism and worldliness of the later Umayyad regime. Sufis sought a personal union with God — divine love and knowledge through intuition rather than through rational deduction and study of the shari'a. The earliest of the Sufis followed an ascetic routine (denial of physical desires to achieve a spiritual goal), dedicating themselves to fasting, prayer, meditation on the Qur'an, and the avoidance of sin.

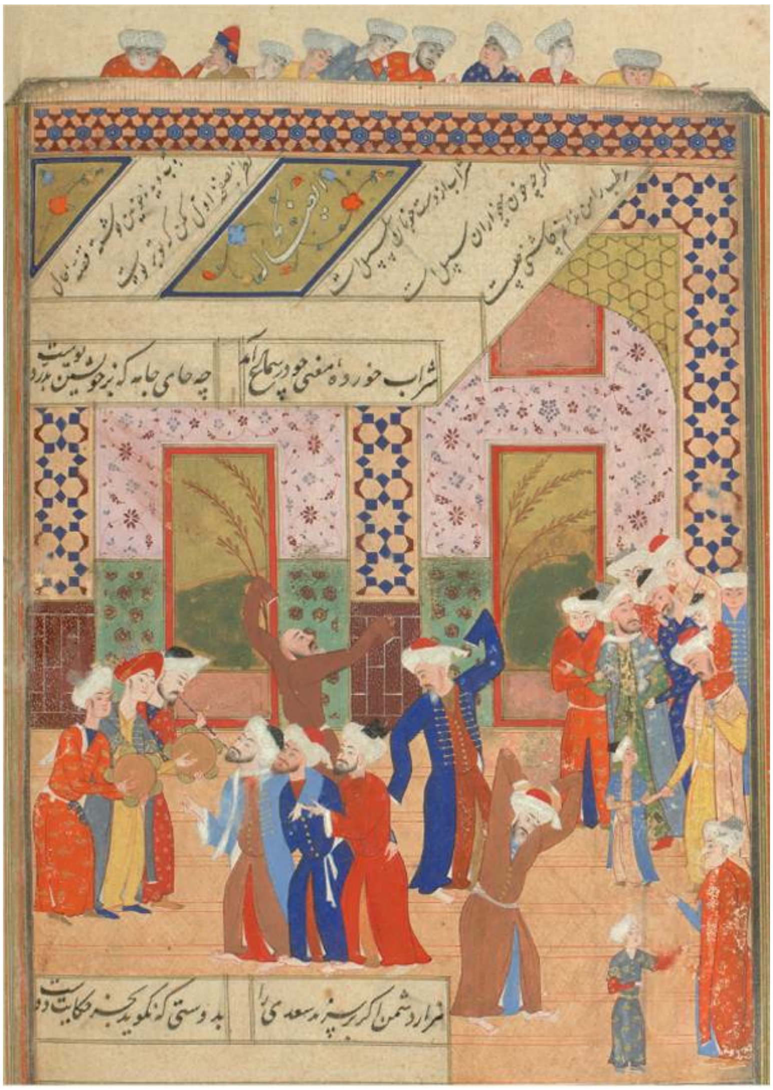
The woman mystic Rabi'a (717–801) epitomized this combination of renunciation and devotion. An attractive woman who refused marriage so that nothing would distract her from a total commitment to God, Rabi'a attracted followers, for whom she served as a spiritual guide. One of her poems captures her deep devotion: "O my lord, if I worship thee from fear of hell, and if I worship thee in hope of paradise, exclude me thence, but if I worship thee for thine own sake, then withhold not from me thine eternal beauty."[6]

Between the tenth and the thirteenth centuries groups of Sufis gathered around prominent leaders called *shaykhs*; members of these groups were called *dervishes*. Dervishes entered hypnotic or ecstatic trances, either through the constant repetition of certain prayers or through physical exertions such as whirling or dancing (hence the English phrase "whirling dervish" for one who dances with abandonment). (See "Analyzing the Evidence: Sufi Collective Ritual," page 252.)

Some Sufis acquired reputations as charismatic holy men to whom ordinary Muslims came seeking healing, charity, spiritual consolation, or political mediation between tribal and factional rivals. Other Sufis became known for their writings. Probably the most famous medieval Sufi was the Spanish mystic-philosopher Ibn al'Arabi (1165–1240). He traveled widely in Spain, North Africa, and Arabia seeking masters of Sufism. In Mecca he received a "divine commandment" to begin his major work, *The Meccan Revelation*, which evolved into a personal encyclopedia of 560 chapters. Also at Mecca, the wisdom of a beautiful young girl inspired him to write a collection of love poems, *The Interpreter of Desires*, for which he composed a mystical commentary. In 1223, after visits to Egypt, Anatolia, Baghdad, and Aleppo, Ibn al'Arabi concluded his pilgrimage through the Islamic world at Damascus, where he produced *The Bezels [Edges] of Wisdom*, considered one of the greatest works of Sufism.

ANALYZING THE EVIDENCE

Sufi Collective Ritual



Edinburgh University Library, Scotland/With kind permission of the Edinburgh University/Bridgeman Images

The collective rituals in which Sufis try through ecstatic experiences to come closer to God have always fascinated outsiders, including non-Sufi Muslims. The work of art shown here has connections both to religion and to literature: it is a sixteenth-century Persian miniature painting illustrating the work of a fourteenth-century Persian poet whose poems had a place in Sufi rituals.

The Sufi movement originally emerged in response to the increasing worldliness of the expanding Muslim community and flourished in Safavid Persia. As a way to draw closer to God, Sufis engaged in ascetic practices and performed group rituals, which could involve music, singing, dancing, and recitation of prayers. While performing the rituals, Sufis experienced sensations of happiness, fear, hope, longing, and bliss. Because it is difficult to convey ecstatic or mystical experiences in normal language, writers commonly employed the language of love poetry to articulate these feelings.

The fourteenth-century poet Hafiz (1325–1389), whose work is illustrated here, is one of the most influential poets in the Persian language. He wrote tributes to the joys of love and wine, as well as satires on court politics of the period. His lyric poetry excels at conveying the intoxication of love and mystical experience.

More than a century after Hafiz's death, the painter Sultan Muhammad (active 1500–1550) employed the conventions of Persian miniature painting to illustrate Sufis inspired by Hafiz's poetry. Persian miniatures were first developed as an art form to illustrate luxury books and are generally the size of a page. The colors are bright and pure because the artists used mineral pigments that do not fade. Faces are often shown in three-quarters view, and the lighting is even, with no shadows or shading shown. Viewers of these works look down on the scene as though they were situated at a higher spot. The paintings often combine interior elements with exterior elements, which are visible through windows. Despite the small size of the paintings, numerous figures are often depicted, with those farther away shown higher on the page. The clothing of the figures, the patterns on the floor and wall tiles, and even the plants seen through the windows are commonly rendered in fine detail.

QUESTIONS FOR ANALYSIS

1. Which features of this painting conform to the conventions of Persian miniature painting?
2. How are people dressed? Are distinctions among people expressed through their dress?
3. What musical instruments do you see?
4. What sort of ritual activity is depicted? Are any of the people mere observers, or are they all participating in one way or another?

Muslim-Christian Encounters

How did Muslims and Christians come into contact with each other, and how did they view each other?

During the early centuries of its development, Islam came into contact with the other major religions of Eurasia — Hinduism in India, Buddhism in Central Asia, Zoroastrianism in Persia, and Judaism and Christianity in western Asia and Europe. However, the relationship that did the most to define Muslim identity was the one with Christianity. To put this another way, the most significant "other" to Muslims in the heartland of Islam was Christendom. The close physical proximity and the long history of military encounters undoubtedly contributed to making the Christian-Muslim encounter so important to both sides.

European Christians and Middle Eastern Muslims shared a common Judeo-Christian heritage. In the classical period of Islam, Muslims learned about Christianity from the Christians they met in conquered territories; from the Old and New Testaments; from Jews; and from Jews and Christians who converted to Islam. Before 1400 there was a wide spectrum of Muslim opinion about Jesus and Christians. At the time of the Crusades and the Christian reconquest of Muslim Spain (the *reconquista*, 722–1492), polemical anti-Christian writings appeared. In other periods, Muslim views were more positive.

In the Middle Ages, Christians and Muslims met frequently in business and trade. Commercial contacts, especially when European merchants resided for a long time in the Muslim East, gave them familiarity with Muslim art and architecture. Also, Christians very likely borrowed aspects of their higher education system from Islam.

In the Christian West, Islam had the greatest cultural impact in Andalusia in southern Spain. Between roughly the eighth and twelfth centuries Muslims, Christians, and Jews lived in close proximity in Andalusia, and some scholars believe the period represents a remarkable era of interfaith harmony. Many Christians adopted Arab patterns of speech and dress, gave up the practice of eating pork, and developed a special appreciation for Arab music and poetry. Some Christian women of elite status chose the Muslim practice of going out in public with their faces veiled. These assimilated Christians, called **Mozarabs** (moh-ZAR-uhbz), did not attach much importance to the doctrinal differences between the two religions.

Mozarabs Christians who adopted some Arab customs but did not convert.

However, Mozarabs soon faced the strong criticism of both Muslim scholars and Christian clerics. Muslim teachers feared that close contact between people of the two religions would lead to Muslim contamination and become a threat to the Islamic faith. Christian bishops worried that a knowledge of Islam would lead to confusion about essential Christian doctrines. Both Muslim scholars and Christian theologians argued that assimilation led to moral decline.

Thus, beginning in the late tenth century Muslim regulations closely defined what Christians and Muslims could do. A Christian, however much assimilated, remained an unbeliever, a word that carried a pejorative connotation. Mozarabs had to live in special sections of cities; could not learn the Qur’an, employ Muslim workers or servants, or build new churches; and had to be buried in their own cemeteries. A Muslim who converted to Christianity was sentenced to death. By about 1250 the Christian reconquest of Muslim Spain had brought most of the Iberian Peninsula under Christian control. With their new authority, Christian kings set up schools that taught both Arabic and Latin to train missionaries.

Beyond Andalusian Spain, mutual animosity limited contact between people of the two religions. The Muslim assault on Christian Europe in the eighth and ninth centuries — with villages burned, monasteries sacked, and Christians sold into slavery — left a legacy of bitter hostility. Christians felt threatened by a faith that acknowledged God as creator of the universe but denied the Trinity and that accepted Jesus as a prophet but denied his divinity. Europeans’ perception of Islam as a menace helped inspire the Crusades of the eleventh through thirteenth centuries (see “The Crusades” in Chapter 14).

Playing Chess This page from a thirteenth-century book on chess and other games depicts a Moor and a Christian playing chess together.

Despite the conflicts between the two religions, Muslim scholars often wrote sympathetically about Jesus. For example, Ikhwan al-Safa, an eleventh-century Islamic brotherhood, held that in his preaching Jesus deliberately rejected the harsh punishments reflected in the Jewish Torah and tried to be the healing physician, teaching by parables and trying to touch people's hearts by peace and love. The prominent theologian and qadi (judge) of Teheran, Abd al-Jabbar (d. 1024), though not critical of Jesus, argued that Christians had rejected Jesus's teachings: they failed to observe the ritual purity of prayer, substituting poems by Christian scholars for scriptural prayers; they gave up circumcision, the sign of their covenant with God and Abraham; they moved the Sabbath from Saturday to Sunday; they allowed the eating of pork and shellfish; and they adopted a Greek idea, the Trinity, defending it by quoting Aristotle. Thus, al-Jabbar maintained, Christians failed to observe the laws of Moses and Jesus and distorted Jesus's message.

In the Christian West, both positive and negative views of Islam appeared in literature. The Bavarian knight Wolfram von Eschenbach's *Parzival* and the Englishman William Langland's *Piers the Plowman* — two medieval poems that survive in scores of manuscripts, suggesting that they circulated widely — reveal broad-mindedness and tolerance toward Muslims. Some travelers in the Middle East were impressed by the kindness and generosity of Muslims and with the strictness and devotion with which Muslims observed their faith. Frequently, however, Christian literature portrayed Muslims as the most dreadful of Europe’s enemies, guilty of every kind of crime. In his *Inferno*, for example, the great Florentine poet Dante (1265–1321) placed the Muslim philosophers Avicenna and Averroës with other virtuous “heathens,” among them Socrates and Aristotle, in the first circle of Hell, where they endured only moderate punishment. Muhammad, however, Dante consigned to the ninth circle, near Satan himself, where he was condemned as a spreader of discord and scandal and suffered perpetual torture.

Even when they rejected each other most forcefully, the Christian and Islamic worlds had a significant impact on each other. Art styles, technology, and even institutional practices spread in both directions. During the Crusades Muslims adopted Frankish weapons and methods of fortification. Christians in contact with Muslim scholars recovered ancient Greek philosophical texts that survived only in Arabic translation.

Chapter Summary

Muhammad, born in the Arabian peninsula, experienced a religious vision, after which he preached to the people to give up their idols and submit to the one indivisible God. He believed in the same God as the Christians and Jews and taught strict monotheism. Islam, the religion based on Muhammad’s teachings, appropriated much of the Old and New Testaments of the Bible. After Muhammad’s death, his followers gathered his revelations, eventually producing the Qur’an.

Within the span of a century, Muslims carried their faith from the Arabian peninsula through the Middle East, to North Africa and Spain, and to the borders of India. Successors to Muhammad established the caliphate, which through two successive dynasties coordinated rule over Islamic lands. A key challenge faced by the caliphate was a fundamental division in Muslim theology between the Sunnis and the Shi’a.

Over time, many parts of the Muslim empire gained considerable local independence. Far-flung territories such as Spain began to break away from the Baghdad-centered caliphate. By the tenth century Turks played a more important role in the armies and came to be the effective rulers in much of the Middle East. They were succeeded by the Mongols, who invaded the Middle East in the thirteenth century and ruled the central Islamic lands for eighty years.

Muslim society was distinctly hierarchical. In addition to a structure that privileged the ruling Arab Muslims over converts to Islam, then over Jews, Christians, and Zoroastrians, there were also a substantial number of slaves, generally war captives. Slaves normally were converted to Islam and might come to hold important positions, especially in the army. Distinctions between men’s and women’s roles in Islamic society were strict. Over time, the seclusion and veiling of women became common practices, especially among the well-to-do.

Islam did not discourage trade and profitmaking. By land and sea Muslim merchants transported a rich variety of goods across Asia, the Middle East, Africa, and western Europe. As trade thrived, innovations such as money orders, bills of exchange, and joint stock companies aided the conduct of business.

Wealth from trade made possible a gracious and sophisticated culture in the cities of the Islamic world, especially Baghdad and Córdoba. During this period Muslim scholars produced important work in many disciplines, especially mathematics, medicine, and philosophy. A new spiritual and intellectual tradition arose in the mystical practices of Sufism. Muslims, Christians, and Jews interacted in many ways during this period. At the time of the Crusades and of the Christian reconquest of Islamic Spain, polemical anti-Christian writings appeared, but in other periods Islamic views were more positive. Many Christians converted in the early centuries of the spread of Islam. Others such as the Mozarabs assimilated into Muslim culture while retaining their religion.

CONNECTIONS

During the five centuries that followed Muhammad’s death, his teachings came to be revered in large parts of the world, from Spain to Afghanistan. Although in some ways similar to the earlier spread of Buddhism out of India and Christianity out of Palestine, the spread of Islam occurred largely through military conquests that extended Islamic lands. Still, conversion was never complete; both Christians and Jews maintained substantial communities within Islamic lands. Moreover, cultural contact among Christians, Jews, and Muslims was an important element in the development of each culture.

Muslim civilization in these centuries drew from many sources, including Persia and Byzantium, and in turn had broad impact beyond its borders. Muslim scholars preserved much of early Greek philosophy and science through translation into Arabic. Trade connected the Muslim lands both to Europe and to India and China.

During the first and second centuries after Muhammad, Islam spread along the Mediterranean coast of North Africa, which had been part of the Roman world. The next chapter explores other developments in the enormous and diverse continent of Africa during this time. Many of the written sources that tell us about the African societies of these centuries were written in Arabic by visitors from elsewhere in the Islamic world. Muslim traders traveled through many of the societies in Africa north of the Congo, aiding the spread of Islam to the elites of many of these societies. Ethiopia was an exception, as Christianity spread there from Egypt before the time of Muhammad and retained its hold in subsequent centuries. Africa’s history is introduced in the next chapter.

continent, its history, or its people. The continent’s sheer size, along with tropical diseases and the difficulty of navigating Africa’s rivers inland, limited travel to a few intrepid Muslim adventurers such as Ibn Battuta. (See “Individuals in Society: Ibn Battuta” in Chapter 9.) Ethnocentrism and racism became critical factors with the beginning of the Atlantic slave trade in the 1500s, followed in the nineteenth century by European colonialism, which distorted and demeaned knowledge and information about Africa. More recent scholarship has allowed us to learn more about early African civilizations and to appreciate the richness, diversity, and dynamism of those cultures. We know now that between about 400 and 1,500 civilizations, some highly centralized, bureaucratized, and socially stratified, developed in Africa alongside communities with looser forms of social organization often held together through common kinship bonds.

In West Africa several large empires closely linked to the trans-Saharan trade in salt, gold, cloth, ironware, ivory, and other goods arose during this period. After 700 this trade connected West Africa with Muslim societies in North Africa and the Middle East. Vast stores of new information, contained in books and carried by visiting scholars, arrived from an Islamic world that was experiencing a golden age.

Meanwhile, Bantu-speaking peoples spread ironworking and domesticated crops and animals from modern Cameroon to Africa’s southern tip. They established kingdoms, such as Great Zimbabwe, in the interior. At the same time, the Swahili established large and prosperous city-states along the Indian Ocean coast.

The Land and Peoples of Africa

How did Africa’s geography shape its history and contribute to its diverse population?

The world’s second-largest continent after Asia, Africa covers 20 percent of the earth’s land surface, and African cultures are enormously diverse both within and across regions. It is difficult and mistaken to make broad generalizations about African life — statements that begin “African culture is …” or “African people are …” are virtually meaningless. African peoples are not and never have been homogeneous, and this rich diversity makes the study of African history both exciting and challenging.

Five main climatic zones roughly divide the African continent (Map 10.1). Fertile land with unpredictable rainfall borders parts of the Mediterranean in the north and the southwestern coast of the Cape of Good Hope in the south. Inland from these areas are dry steppes with little plant life. These steppes gradually give way to Africa’s great deserts: the vast Sahara in the north — 3.5 million square miles — and the Namib (NAH-mihb) and Kalahari in the south. The Sahara’s southern sub-desert fringe is called the Sahel (SA-hihl), from the Arabic word for “shore.” The savannas (flat grasslands) extend in a swath across the continent’s widest part — parts of south-central Africa and along the eastern coast — and account for some 55 percent of the African continent. Dense, humid tropical rain forests stretch along coastal West Africa and on both sides of the equator in central Africa. Africa’s climate is mostly tropical, with subtropical climates limited to the northern and southern coasts and the regions of high elevation. Rainfall is seasonal on most of the continent and is very sparse in desert and semidesert areas.

MAP 10.1 The Geography of Africa Africa's climate zones have always played a critical role in the history of the continent and its peoples. These zones mirror each other north and south of the equator: tropical forest, savanna, sub-desert, desert, and Mediterranean climate.

Geography and climate have significantly shaped African economic development. In the eastern African plains, the earliest humans hunted wild animals. The drier steppe regions favored herding. Wetter savanna regions, like the Nile Valley, encouraged grain-based agriculture. Tropical forests favored hunting and gathering and, later, root-based agriculture. Rivers and lakes supported economies based on fishing.

Africa's peoples are as diverse as the continent's topography. In North Africa contacts with Asian and European civilizations date back to the ancient Phoenicians (fi-NEE-shuhns), Greeks, and Romans (see “Building a Hellenized Society” in Chapter 5 and “Overseas Conquests and the Punic Wars, 264–133 B.C.E.” in Chapter 6). Groups living on the coast or along trade routes had the greatest degree of contact with outside groups. The Berbers of North Africa, living along the Mediterranean, intermingled with many different peoples — with Muslim Arabs, who first conquered North Africa in the seventh and eighth centuries C.E. (see “Trade and Commerce” in Chapter 9); with Spanish Muslims and Jews, many of whom settled in North Africa following their expulsion from Spain in 1492 (see “Politics and the State in the Renaissance” in Chapter 15); and with sub-Saharan peoples, with whom they traded across the Sahara Desert. The Swahili (swah-HEE-lee) peoples along the East African coast developed a maritime civilization and had rich commercial contacts with southern Arabia, the Persian Gulf, India, China, and the Malay Archipelago (ahr-kuh-PEL-uh-goh).

Nok Woman Hundreds of terra-cotta sculptures such as the figure of this woman survive from the Nok culture, which originated in the central plateau of northern Nigeria in the first millennium B.C.E.

The ancient Greeks called the peoples who lived south of the Sahara *Ethiopians*, which means “people with burnt faces.” The Berbers also described this region based on its inhabitants, coining the term *Akal-n-Iquinawen*, which survives today as *Guinea* (GIN-ee). The Arabs used the term *Bilad al-Sudan*, which survives as *Sudan*. The Berber and Arab terms both mean “land of the blacks.” South of the Sahara, short-statured peoples, sometimes inaccurately referred to as Pygmies, inhabited the equatorial rain forests. South of those forests, in the continent’s southern third, lived the Khoisan (KOI-sahn), people who were primarily hunters but also had domesticated livestock.

Ancient Egypt, at the crossroads of three continents, was a melting pot of different cultures, peoples, and languages. This diverse and cosmopolitan population contributed to the great achievements of Egyptian culture. Many scholars believe that Africans originating in the sub-Sahara resided in ancient Egypt, primarily in Upper Egypt (south of what is now Cairo), but that other ethnic groups constituted the majority of the population. Merchants based in the capital, Alexandria, carried on trade with East Asia, India, Arabia, East Africa, and across the Mediterranean Sea. Early Descriptions of Africa from Egypt

The Rosetta Stone is a stone slab engraved with three sets of inscriptions: one in ancient Egyptian hieroglyphics; one in a demotic, or common, Egyptian script used in everyday writing; and one in Greek as used by the Ptolemaic rulers (see “Building a Hellenized Society” in Chapter 5). The identical texts contain a Ptolemaic decree honoring Ptolemy V. By comparing the Greek and demotic texts against the hieroglyphics, scholars for the first time could decipher the hieroglyphs. The first excerpt comes from these texts.

The *Periplus of the Erythraean Sea* is the earliest known document describing the East African coast and the Indian Ocean trade. Written in Greek around 50 C.E., probably by an Egyptian merchant from Alexandria, the *Periplus* provides a detailed account of the author’s sea voyage for use by future travelers. The excerpt here describes the East African coast.

■ With good fortune! It has seemed fitting to the priests of all the temples of Egypt, as to the honours which are due to King Ptolemy, living forever, the Manifest God …, and those … due to the Father-loving Gods, who brought him into being, and those … due to the Beneficent Gods, … and those … due to the Brother-and-Sister Gods, … and those … due to the Saviour Gods, the ancestors of his ancestors, to increase them; and that a statue should be set up for King Ptolemy, … which should be called “Ptolemy who has protected the Bright Land,” the meaning of which is “Ptolemy who has preserved Egypt.” …

And there should be produced a cult image for King Ptolemy, … son of Ptolemy and Queen Arsinoe, the Father-loving Gods, … and a procession festival should be held in the temples and the whole of Egypt for King Ptolemy, … each year, … for five days, with garlands being worn, burnt offerings and libations being performed … ; and the priests … in each of the temples of Egypt should be called “The Priests of the Manifest God.” …

And the decree should be written on a stela of hard stone, in sacred writing, document writing, and Greek writing, and … set up in the first-class temples, the second-class temples and the third-class temples, next to the statue of the King, living forever.

■ 15. After two courses of a day and night along the Ausanitic coast [coast of modern Zanzibar], is the island Menuthias, about three hundred stadia from the mainland, low and wooded, in which there are rivers and many kinds of birds and the mountain-tortoise. There are no wild beasts except the crocodiles; but there they do not attack men. In this place there are sewed boats, and canoes hollowed from single logs, which they use for fishing and catching tortoise. In this island they also catch them in a peculiar way, in wicker baskets, which they fasten across the channel-opening between the breakers.

16. Two days' sail beyond, there lies the very last market-town of the continent of Azania, which is called Rhapta…. Along this coast live men of piratical habits, very great in stature, and under separate chiefs for each place. The … chief governs … under some ancient right…. And the people of Muza now … send thither many large ships; using Arab captains and agents, who are familiar with the natives and intermarry with them, and who know the whole coast and understand the language.

17. There are imported into these markets the lances made at Muza especially for this trade, and hatchets and daggers and awls, and various kinds of glass; and at some places a little wine, and wheat, not for trade, but to serve for getting the good-will of the savages. There are exported from these places a great quantity of ivory, but inferior to that of Adulis, and rhinoceros-horn and tortoise-shell (which is in best demand after that from India), and a little palm-oil.

QUESTIONS FOR ANALYSIS

1. What information about Ptolemaic Egypt is contained in the Rosetta Stone texts?
2. Who are the various gods, besides the manifest god, Ptolemy, in the Rosetta Stone texts?
3. What aspects of the East African coast did the author of the *Periplus* write about, and how might these details benefit future travelers to the region?

Early African Societies

How did agriculture affect life among the early societies in the western Sudan and among the Bantu-speaking societies of central and southern Africa?

The introduction of new crops from Asia and the establishment of settled agriculture profoundly changed many African societies, although the range of possibilities largely depended on local variations in climate and geography. Bantu-speakers took the knowledge of domesticated livestock and agriculture, along with the ironworking skills that had developed in northern and western Africa, and spread them south across central and southern Africa. The most prominent feature of early West African society was a strong sense of community based on blood relationships and religion.

Agriculture and Its Impact

Agriculture began very early in Africa. Knowledge of plant cultivation moved west from the Levant (leh-VANT) (modern Israel and Lebanon), arriving in the Nile Delta in Egypt about the fifth millennium B.C.E. Settled agriculture then traveled down the Nile Valley and moved west across the Sahel to the central and western Sudan. West Africans were living in agricultural communities by the first century B.C.E. From there plant cultivation spread to the equatorial forests. African farmers learned to domesticate plants. Cereal-growing people probably taught forest people to plant grains on plots of land cleared by a method known as "slash and burn." Gradually most Africans evolved a sedentary way of life: living in villages, clearing fields, relying on root crops, and fishing. Hunting-and-gathering societies survived only in scattered parts of Africa, particularly in the central rain forest region and in southern Africa.

Rock Painting at Tassili, Algeria This scene of cattle grazing while a man stands guard over them was found on a rock face in Tassili n'Ajjer, a mountainous region in the Sahara where over fifteen thousand of these paintings have been catalogued. The oldest date back 9,000–12,000 years. Behind the man are perhaps his two children at play and his two wives working together in the compound. A cow stands in the enclosure to the right.

Between 1500 B.C.E. and 1000 B.C.E.. agriculture also spread southward from Ethiopia along the Great Rift Valley of present-day Kenya and Tanzania. Archaeological evidence reveals that the peoples of East Africa grew cereals, raised cattle, and used wooden and stone tools. Cattle raising spread more quickly than did planting, the herds prospering on the open savannas that are free of tsetse (SEHT-see) flies, which are devastating to cattle. Early East African peoples prized cattle highly. Many trading agreements, marriage alliances, political compacts, and treaties were negotiated in terms of cattle.

Cereals such as millet and sorghum are indigenous to Africa. Scholars speculate that traders brought bananas, plantains, taros (a type of yam), sugarcane, and coconut palms to Africa from Southeast Asia between 900 and 1100 C.E. Because tropical forest conditions were ideal for banana plants, their cultivation spread rapidly. Throughout sub-Saharan Africa native peoples also domesticated donkeys, pigs, chickens, geese, and ducks, although all these came from outside Africa. The guinea fowl appears to be the only animal native to Africa that was domesticated, despite the wide varieties of animal species in Africa. All the other large animals — elephants, hippopotamuses, giraffes, rhinoceros, and zebras — were simply too temperamental to domesticate. The evolution from a hunter-gatherer life to a settled life had profound effects. In contrast to nomadic societies, settled societies made shared or common needs more apparent, and those needs strengthened ties among extended families. Agricultural and pastoral populations also increased, though scholars speculate that this increase did not remain steady, but rather fluctuated over time. Nor is it clear that population growth was accompanied by a commensurate increase in agricultural output.

Early African societies were similarly influenced by the spread of ironworking, though scholars dispute the route by which this technology spread to sub-Saharan Africa. Some believe the Phoenicians brought the iron-smelting technique to northwestern Africa, from which it spread southward. Others insist it spread westward from the Meroë (MEHR-oh-ee) region of the Nile. The great trans-Saharan trade routes may have carried ironworking south from the Mediterranean coast. In any case, ancient iron tools found at the village of Nok on the Jos Plateau in present-day Nigeria seem to prove that ironworking industries existed in West Africa by at least 700 B.C.E. The Nok culture, which enjoys enduring fame for its fine terra-cotta sculptures, flourished from about 800 B.C.E. to 200 C.E.

Bantu Migrations

The spread of ironworking is linked to the migrations of Bantu-speaking peoples. Today the overwhelming majority of the 70 million people living south and east of the Congo River speak a **Bantu** language. Lacking written sources, modern scholars have tried to reconstruct the history of Bantu-speakers on the basis of linguistics, oral traditions, archaeology, and anthropology. Botanists and zoologists have played particularly critical roles in providing information about early diets and environments. The word *Bantu* is a linguistic classification, and linguistics (the study of the nature, structure, and modification of human speech) has helped scholars explain the migratory patterns of African peoples east and south of the equatorial forest.

Bantu Speakers of a Bantu language living south and east of the Congo River.

Bantu-speaking peoples originated in the Benue (BEY-nwey) region, the borderlands of modern Cameroon and Nigeria. Between the first and second millennium B.C.E. they began to spread south and east into the equatorial forest zone. Historians still debate why they began this movement. Some hold that rapid population growth sent people in search of land. Others believe that the evolution of centralized kingdoms allowed rulers to expand their authority, while causing newly subjugated peoples to flee in the hope of regaining their independence.

Because the earliest Bantu-speakers lacked words for grains and cattle herding, they probably were not initially involved in grain cultivation or livestock domestication. During the next fifteen hundred years, Bantu-speakers migrated throughout the savanna, adopted mixed agriculture, and learned ironworking. Mixed agriculture (cultivating cereals and raising livestock) and ironworking were practiced in western East Africa (the region of modern Burundi) in the first century B.C.E. In the first millennium C.E. Bantu-speakers migrated into eastern and southern Africa. Here the Bantu-speakers, with their iron weapons, either killed, drove off, or assimilated the hunting-gathering peoples they met. Some of the assimilated inhabitants gradually adopted a Bantu language, contributing to the spread of Bantu culture.

Bantu Migrations, ca. 1000 B.C.E.–1500 C.E.

The settled cultivation of cereals, the keeping of livestock, and the introduction of new crops such as the banana — together with Bantu-speakers' intermarriage with indigenous peoples — led over a long period to considerable population increases and the need to migrate farther. The so-called Bantu migrations should not be seen as a single movement sweeping across Africa from west to east to south and displacing all peoples in its path. Rather, those migrations were an extended series of group interactions between Bantu-speakers and pre-existing peoples in which bits of culture, languages, economies, and technologies were shared and exchanged to produce a wide range of cultural variation across central and southern Africa.[1]

The Bantu-speakers' expansion and subsequent land settlement that dominated eastern and southern African history in the first fifteen hundred years of the Common Era were uneven. Significant environmental differences determined settlement patterns. Some regions had plenty of water, while others were very arid. These differences resulted in very uneven population distribution. The greatest population density seems to have been in the region bounded on the west by the Congo River and on the north, south, and east by Lakes Edward and Victoria and Mount Kilimanjaro (kil-uh-muhn-JAHR-oh). The rapid growth of the Bantu-speaking population led to further migration southward and eastward. By the eighth century the Bantu-speaking people had crossed the Zambezi River and had begun settling in the region of present-day Zimbabwe (zim-BAHB-wey). By the fifteenth century they had reached Africa's southeastern coast.

Life in the Kingdoms of the Western Sudan, ca. 1000 B.C.E.–800 C.E.

The **Sudan** (soo-DAN) is the region bounded by the Sahara to the north, the Gulf of Guinea to the south, the Atlantic Ocean to the west, and the mountains of Ethiopia to the east (see Map 10.1). In the western Sudan savanna a series of dynamic kingdoms emerged in the millennium before European intrusion began in the 1400s and 1500s.

Sudan The African region surrounded by the Sahara, the Gulf of Guinea, the Atlantic Ocean, and the mountains of Ethiopia

Between 1000 B.C.E. and 200 C.E. the peoples of the western Sudan made the momentous shift from nomadic hunting to settled agriculture. The rich savanna proved ideally suited to cereal production, especially rice, millet, and sorghum. People situated near the Senegal River and Lake Chad supplemented their diet with fish. Food supply affects population, and the region's inhabitants increased dramatically in number. By 400 C.E. the entire savanna, particularly around Lake Chad, the Niger (NIGH-juhr) River bend, and present-day central Nigeria, had a large population.

Families and clans affiliated by blood kinship lived together in villages or small city-states. The extended family formed the basic social unit. A chief, in consultation with a council of elders, governed a village. Some villages seem to have formed kingdoms. In this case, village chiefs were responsible to regional heads, who answered to provincial governors, who in turn were responsible to a king. The kings and their families formed an aristocracy.

Kingship in the Sudan may have emerged from the priesthood. African kings always had religious sanction or support for their authority, as they had the ability to negotiate with the gods, and were often considered divine. In this respect, early African kingship bears a strong resemblance to Germanic kingship of the same period (see “Political Developments” in Chapter 14).

Although the Mende (MEN-dee) in modern Sierra Leone was one of the few African societies to be led by female rulers, women exercised significant power and autonomy in many African societies. Among the Asante (uh-SAN-tee) in modern-day Ghana, one of the most prominent West African peoples, the king was considered divine but shared some royal power with the Queen Mother. She was a full member of the governing council and enjoyed full voting power in various matters of state. The Queen Mother initially chose the future king from eligible royal candidates. He then had to be approved by both his elders and the commoners. Among the Yoruba in modern Nigeria, the Queen Mother held the royal insignia and could refuse it if the future king did not please her. The institutions of female chiefs, known as *iyalode* among the Yoruba (YOHR-uh-buh) and *omu* among the Igbo (IG-boh) in modern Nigeria, were established to represent women in the political process. The *omu* was even considered a female co-ruler with the male chief.

Western Sudanese religions, like African religions elsewhere, were animistic and polytheistic. Most people believed that a supreme being had created the universe and was the source of all life. Nearly all African religions also recognized ancestral spirits, which might seek God’s blessings for families’ and communities’ prosperity and security as long as these groups behaved appropriately. If not, the ancestral spirits might not protect them from harm, and illness and misfortune could result. Some African religions believed as well that nature spirits lived in such things as the sky, forests, rocks, and rivers. These spirits controlled natural forces and had to be appeased. Because special ceremonies were necessary to satisfy the spirits, special priests with the knowledge and power to communicate with them through sacred rituals were needed. Family and village heads were often priests. Each family head was responsible for ceremonies honoring the family’s dead and living members.[2]

In some West African societies, oracles who spoke for the gods were particularly important. Some of the most famous were the Igbo oracles in modern Nigeria. These were female priestesses who were connected with a particular local deity that resided in a sacred cave or other site. Inhabitants of surrounding villages would come to the priestess to seek advice about such matters as crops and harvests, war, marriage, legal issues, and religion. Clearly, these priestesses held much power and authority, even over the local male rulers.

Kinship patterns and shared religious practices helped bind together the early western Sudan kingdoms. Islam’s spread across the Sahara by at least the ninth century C.E., however, created a north-south religious and cultural divide in the western Sudan. Islam advanced across the Sahel but halted when it reached the West African savanna and forest zones. Societies in these southern zones maintained their traditional animistic religious practices. Muslim empires along the Niger River’s great northern bend evolved into formidable powers ruling over sizable territory as they seized control of the southern termini of the trans-Saharan trade. What made this long-distance trade possible was the “ship of the desert,” the camel.

The Trans-Saharan Trade

What characterized trans-Saharan trade, and how did it affect West African society?

“Trans-Saharan trade” refers to the north-south trade across the Sahara (Map 10.2). The camel had an impact on this trade comparable to the very important impact of horses and oxen on European agriculture. Although scholars dispute exactly when the camel was introduced from Central Asia — first into North Africa, then into the Sahara and the Sudan — they agree that it was before 200 C.E. The trans-Saharan trade brought lasting economic and social change to Africa, facilitating the spread of Islam via Muslim Arab traders, and affected the development of world commerce.

Mapping the Past

MAP 10.2 African Kingdoms and Trade, ca. 800–1500 Throughout world history powerful kingdoms have generally been closely connected to far-flung trade networks.

ANALYZING THE MAP Which kingdoms, empires, and city-states were linked to the trans-Saharan trade network? Which were connected to the Indian Ocean trade network? To the Portuguese route?

CONNECTIONS How were the kingdoms, empires, and city-states shown on this map shaped by their proximity to trade routes?

The Berbers of North Africa

Sometime in the fifth century C.E. the North African **Berbers** (BUHR-buhrs) fashioned a saddle for use on the camel. The saddle gave the Berbers and later the region’s Arabian inhabitants maneuverability on the animal and thus a powerful political and military advantage: they came to dominate the desert and to create lucrative routes across it. The Berbers determined who could enter the desert, and they extracted large sums of protection money from merchant caravans in exchange for a safe trip.

Berbers North African peoples who controlled the caravan trade between the Mediterranean and the Sudan

Between 700 C.E. and 900 C.E. the Berbers developed a network of caravan routes between the Mediterranean coast and the Sudan (see Map 10.2). The long expedition across the Sahara testifies to the traders’ spirit and to their passion for wealth. Ibn Battuta, an Arab traveler in the fourteenth century, when the trade was at its height, left one of the best descriptions of the trans-Saharan traffic. (See “Individuals in Society: Ibn Battuta” in Chapter 9.)

Nomadic raiders, the Tuareg (TWAH-rehg), posed a serious threat to trans-Saharan traders. The Tuareg were Berbers who lived in the desert uplands and preyed on Nthe caravans as a way of life. To avoid being victimized, merchants made safe-conduct agreements with them and selected guides from among them. Large numbers of merchants crossed the desert together to discourage attack; caravans of twelve thousand camels were reported in the fourteenth century.

Tuareg Berber Camel Rider Berbers such as this man on his camel near Timbuktu in Mali have crossed the Sahara Desert for hundreds of years, transporting primarily salt from the north and returning with gold and other items from West Africa. The Tuareg are often referred to as the “Blue Men of the Sahara” because of their distinctive deeply dyed blue robes and turbans, which they still wear today.

Berber merchants from North Africa controlled the caravan trade that carried dates, salt (essential in tropical climates to replace the loss from perspiration) from the Saharan salt mines, and some manufactured goods

— silk and cotton cloth, beads, mirrors — to the Sudan. These products were exchanged for the much-coveted commodities of the West African savanna — gold, ivory, gum, kola nuts (eaten as a stimulant), and enslaved West African men and women who were sold to Muslim slave markets in Morocco, Algiers, Tripoli, and Cairo.

Effects of Trade on West African Society

The steady growth of trans-Saharan trade (Table 10.1) had three important effects on West African society. First, trade stimulated gold mining. Parts of modern-day Senegal, Nigeria, and Ghana contained rich veins of gold, and scholars estimate that by the eleventh century nine tons of gold were exported to the Mediterranean coast and Europe annually — a prodigious amount for the time, since even with modern machinery and sophisticated techniques, total gold exports from the same region in 1937 amounted to only twenty-one tons. Some of this metal went to Egypt. From there it was transported down the Red Sea and eventually to India (see Map 9.2) to pay for the spices and silks demanded by Mediterranean commerce. In this way, African gold linked the entire world, exclusive of the Western Hemisphere.

Second, trade in gold and other goods created a desire for slaves. Slaves were West Africa's second-most-valuable export (after gold). Slaves worked the gold and salt mines, and in Muslim North Africa, southern Europe, and southwestern Asia there was a high demand for household slaves among the elite. African slaves, like their early European and Asian counterparts, seem to have been peoples captured in war. Recent research suggests, moreover, that large numbers of black slaves were also recruited for Muslim military service through the trans-Saharan trade. Table 10.1 shows the scope of the trans-Saharan slave trade. The total number of blacks enslaved over an 850-year period between 650 and 1500 C.E. may be tentatively estimated at more than 4 million.[3]

TABLE 10.1 **Estimated Magnitude of Trans-Saharan Slave Trade, 650–1500**

YEARS	ANNUAL AVERAGE OF SLAVES TRADED	TOTAL
650–800	1,000	150,000
800–900	3,000	300,000
900–1100	8,700	1,740,000
1100–1400	5,500	1,650,000
1400–1500	4,300	430,000

Source: R. A. Austen, “The Trans-Saharan Slave Trade: A Tentative Census,” in *The Uncommon Market: Essays in the Economic History of the Atlantic Slave Trade*, ed. H. A. Gemery and J. S. Hogendorn (New York: Academic Press, 1979).

Slavery in Muslim societies, as in European and Asian countries before the fifteenth century, was not based on skin color. Muslims also enslaved Caucasians who had been purchased, seized in war, or kidnapped from Europe. Wealthy Muslim households in Córdoba, Alexandria, and Tunis often included slaves of a number of races, all of whom had been completely cut off from their cultural roots. Likewise, West African kings who sold blacks to northern traders also bought a few white slaves — Slavic, British, and Turkish — for their own domestic needs. Race had little to do with the phenomenon of slavery.

The third important effect of trans-Saharan trade on West African society was its role in stimulating the development of urban centers. Scholars date the growth of African cities from around the early ninth century. Families that had profited from trade tended to congregate in the border zones between the savanna and the Sahara. They acted as middlemen between the miners to the south and the Muslim merchants from the north. By the early thirteenth century these families had become powerful merchant dynasties. Muslim traders from the Mediterranean settled permanently in the trading depots, from which they organized the trans-Saharan caravans. The concentration of people stimulated agriculture and the craft industries. Gradually cities of sizable population emerged. Jenne (JENN-ay), Gao (GAH-oh), and Timbuktu (tim-buhk-TOO), which enjoyed commanding positions on the Niger River bend, became centers of the export-import trade. Sijilmasa (sih-jil-MAS-suh) grew into a thriving market center. Koumbi Saleh, with between fifteen thousand and twenty thousand inhabitants, was probably the largest city in the western Sudan in the twelfth century. (By European standards, Koumbi Saleh was a metropolis; London and Paris achieved this size only in the late thirteenth century.) Between 1100 and 1400 these cities played a dynamic role in West Africa’s commercial life and became centers of intellectual creativity.

The Spread of Islam in Africa

Perhaps the most influential consequence of the trans-Saharan trade was the introduction of Islam to West Africa. In the eighth century Arab invaders overran all of coastal North Africa. They introduced the Berbers living there to Islam (see “Trade and Commerce” in Chapter 9), and gradually the Berbers became Muslims. As traders, these Berbers carried Islam to sub-Saharan West Africa. From the eleventh century onward militant Almoravids (al-MAWR-uh-vids), a coalition of fundamentalist western Saharan Berbers, preached Islam to the rulers of Ghana, Mali, Songhai, and Kanem-Bornu. These rulers, admiring Muslim administrative techniques and wanting to protect their kingdoms from Muslim Berber attacks, converted to Islam. Some merchants also sought to preserve their elite mercantile status with the Berbers by adopting Islam. Muslims quickly became integral to West African government and society. Hence, from roughly 1000 to 1400, Islam in West Africa was a class-based religion with conversion inspired by political or economic motives. Rural people in the Sahel region and the savanna and forest peoples farther south, however, largely retained their traditional animism.

The Spread of Islam in Africa

Conversion to Islam introduced West Africans to a rich and sophisticated culture. By the late eleventh century Muslims were guiding the ruler of Ghana in the operation of his administrative machinery. Because efficient government depends on keeping and preserving records, Islam's arrival in West Africa marked the advent of written documents there. Arab Muslims also taught Ghana's rulers how to manufacture bricks, and royal palaces and mosques began to be built of brick. African rulers corresponded with Arab and North African Muslim architects, theologians, and other intellectuals, who advised them on statecraft and religion. Islam accelerated the development of the West African empires of the ninth through fifteenth centuries.

After the Muslim conquest of Alexandria, Egypt, in 641 (see "Islamic States and Their Expansion" in Chapter 9), Islam spread southward from

Egypt up the Nile Valley and west to Darfur (dahr-FOOR) and Wadai (wah-digh). This Muslim penetration came not suddenly by military force but, as in the trans-Saharan trade routes in West Africa, gradually through commercial networks.

Muslim expansion from the Arabian peninsula across the Red Sea to the Horn of Africa, then southward along the coast of East Africa, represents a third direction of Islam's growth in Africa. From ports on the Red Sea and the Gulf of Aden (AHD-en), maritime trade carried Islam to East Africa and the Indian Ocean. Between the eighth and tenth centuries Muslims founded the port city of **Mogadishu** (maw-gah-DEE-shoo), today Somalia's capital. In the twelfth century Mogadishu developed into a Muslim sultanate. Archaeological evidence, confirmed by Arabic sources, reveals a rapid Islamic expansion along Africa's east coast in the thirteenth century as far south as Kilwa (KILL-wa), where Ibn Battuta visited a center for Islamic law in 1331.

African Kingdoms and Empires, ca. 800–1500

How were the East African city-states, Aksum, and Great Zimbabwe different from and similar to the kingdoms of the western Sudan?

All African societies shared one basic feature: a close relationship between political and social organization. Ethnic or blood ties bound clan members together. What scholars call **stateless societies** were culturally homogeneous ethnic societies, generally organized around kinship groups. The smallest ones numbered fewer than a hundred people and were nomadic hunting groups. Larger stateless, or decentralized, societies, such as the Tiv in modern central Nigeria, consisted of perhaps several thousand people who lived a settled and often agricultural and/or herding life. These societies lacked a central authority figure, such as a king, capital city, or military. A village or group of villages might recognize a chief who held very limited powers and whose position was not hereditary, but more commonly they were governed by local councils, whose members were either elders or persons of merit. Although stateless societies functioned successfully, their weakness lay in their inability to organize and defend themselves against attack by the powerful armies of neighboring kingdoms or by the European powers of the colonial era.

stateless societies African societies bound together by ethnic or blood ties rather than by being political states

While stateless societies were relatively common in Africa, the period from about 800 to 1500 is best known as the age of Africa's great empires (see Map 10.2). This period witnessed the flowering of several powerful African states. In the western Sudan the large empires of Ghana, Mali (MAH-lee), and Songhai (song-GAH-ee) developed, complete with sizable royal bureaucracies. On the east coast emerged thriving city-states based on sophisticated mercantile activities and, like the western Sudan, heavily influenced by Islam. In Ethiopia, in central East Africa, kings relied on their peoples' Christian faith to strengthen political authority. In southern Africa the empire of Great Zimbabwe, built on the gold trade with the east coast, flourished.

The Kingdom of Ghana, ca. 900–1100

So remarkable was the kingdom of **Ghana** (GAH-nuh) during the age of

Africa's great empires that Arab and North African visitors praised it as a model for other rulers. Even in modern times, ancient Ghana holds a central place in Africa's historical consciousness. When the British Gold Coast colony gained its independence in 1957, its new leaders paid tribute to their heritage by naming their new country Ghana. Although modern Ghana lies far from the site of the old kingdom, the name was selected to signify the rebirth of ancient Ghana's illustrious past.

Ghana From the word for "war chief," the name of a large and influential African kingdom inhabited by the Soninke people

The Soninke (so-NING-kee) people inhabited the nucleus of the territory that became the Ghanaian kingdom. They called their ruler *ghana*, or war chief. By the late eighth century Muslim traders and other foreigners applied the king's title to the region where the Soninke lived, the kingdom south of the Sahara. The Soninke themselves called their land Wagadou (WAH-guh-doo). Only the southern part of Wagadou received enough rainfall to be agriculturally productive, and it was here that the civilization of Ghana developed (see Map 10.2). Skillful farming and efficient irrigation systems led to abundant crop production, which eventually supported a population of as many as two hundred thousand.

In 992 Ghana captured the Berber town of Awdaghost (OW-duh-gost), strategically situated on the trans-Saharan trade route. Thereafter Ghana controlled the southern portion of a major caravan route. Before the year 1000 Ghana's rulers had extended their influence almost to the Atlantic coast and had captured a number of small kingdoms in the south and east. By the early eleventh century the Ghanaian king exercised sway over a territory approximately the size of Texas. No other power in the western Sudan could successfully challenge him.

Throughout this vast West African territory, all authority sprang from the king. Religious ceremonies and court rituals emphasized the king's sacredness and were intended to strengthen his authority. The king's position was hereditary in the matrilineal line — that is, the ruling king's heir was one of the king's sister's sons (presumably the eldest or fittest for battle). According to the eleventh-century Spanish Muslim geographer al-Bakri (1040?–1094), "This is their custom … the kingdom is inherited only by the son of the king's sister. He the king has no doubt that his successor is a son of his sister, while he is not certain that his son is in fact his own."[4] A council of ministers assisted the king in the work of government, and from the ninth century on most of these ministers were Muslims. The royal administration was well served by ideas, skills, and especially literacy brought from the North African and Arab Muslim worlds. The king and his people, however, clung to their ancestral religion and basic cultural institutions.

The Ghanaian king held court in the large and vibrant city of **Koumbi Saleh** (KOOM-bi SA-lah), which was actually two towns, one inhabited by the king and his royal court and the other by Muslims. Al-Bakri provides a valuable description of the Muslim part of the town in the eleventh century:

Koumbi Saleh The city in which the king of Ghana held his court

> The city of Ghana consists of two towns lying on a plain, one of which is inhabited by Muslims and is large, possessing twelve mosques — one of which is a congregational mosque for Friday prayer; each has its imam, its muezzin and paid reciters of the Quran. The town possesses a large number of jurisconsults and learned men.[5]

Either to protect themselves or to preserve their special identity, the Muslims of Koumbi Saleh lived separately from the African artisans and tradespeople. Ghana’s Muslim community was large and prosperous, and Muslim religious leaders exercised civil authority over their fellow Muslims. The presence of religious leaders and other learned Muslims suggests that Koumbi Saleh was a city of vigorous intellectual activity.

Al-Bakri also described the royal court:

> The town inhabited by the king is six miles from the Muslim one and is called Al Ghana…. The residence of the king consists of a palace and a number of dome-shaped dwellings, all of them surrounded by a strong enclosure, like a city wall. In the town … is a mosque, where Muslims who come on diplomatic missions to the king pray.[6]
>
> The king adorns himself, as do the women here, with necklaces and bracelets; on their heads they wear caps decorated with gold, sewn on material of fine cotton stuffing. When he holds court in order to hear the people’s complaints and to do justice, he sits in a pavilion around which stand ten horses wearing golden trappings; behind him ten pages stand, holding shields and swords decorated with gold; at his right are the sons of the chiefs of the country, splendidly dressed and with their hair sprinkled with gold…. When the king’s coreligionists appear before him, they fall on their knees and toss dust on their heads — this is their way of greeting their sovereign. Muslims

> show respect by clapping their hands.[7]

Justice derived from the king, who heard cases at court or on his travels throughout his kingdom. As al-Bakri recounts:

> When a man is accused of denying a debt or of having shed blood or some other crime, a headman (village chief) takes a thin piece of wood, which is sour and bitter to taste, and pours upon it some water which he then gives to the defendant to drink. If the man vomits, his innocence is recognized and he is congratulated. If he does not vomit and the drink remains in his stomach, the accusation is accepted as justified.[8]

This appeal to the supernatural for judgment was similar to the justice by ordeal that prevailed among the Germanic peoples of western Europe at the same time (see “Law and Justice” in Chapter 14).

The king’s elaborate court, the administrative machinery he built, and the extensive territories he governed were all expensive. To support the kingdom, the royal estates — some hereditary, others conquered in war — produced annual revenue, mostly in the form of foodstuffs for the royal household. The king also received tribute annually from subordinate chieftains. Customs duties on goods entering and leaving the country generated revenues as well. Salt was the largest import. Berber merchants paid a tax to the king on the cloth, metalwork, weapons, and other goods they brought into the country from North Africa; in return these traders received royal protection from bandits. African traders bringing gold into Ghana from the south also paid the customs duty.

Finally, the royal treasury held a monopoly on the export of gold. The gold industry was undoubtedly the king’s largest source of income. Medieval Ghana’s fame rested on gold. The ninth-century Persian geographer al-Ya-qubi wrote, “Its king is mighty, and in his lands are gold mines. Under his authority are various other kingdoms — and in all this region there is gold.”[9] The governing aristocracy — the king, his court, and Muslim administrators — occupied the highest rung on the Ghanaian social ladder. On the next rung stood the merchant class. Considerably below the merchants stood the farmers, cattle breeders, gold mine supervisors, and skilled craftsmen and weavers — what today might be called the middle class. Some merchants and miners must have enjoyed great wealth, but, as in all aristocratic societies, money alone did not grant prestige. High status was based on blood and royal service. On the social ladder’s lowest rung were slaves, who worked in households, on farms, and in the mines. As in Asian and European societies of the time, slaves accounted for only a small percentage of the population.

Apart from these social classes stood the army. Ghana’s king maintained at his palace a standing force of a thousand men, comparable to the bodyguards of the Roman emperors. These thoroughly disciplined, well-armed, totally loyal troops protected the king and the royal court. They lived in special compounds, enjoyed the king’s favor, and sometimes acted as his personal ambassadors to subordinate rulers. In wartime this regular army was augmented by levies of soldiers from conquered peoples and by the use of slaves and free reserves.

The reasons for ancient Ghana’s decline are still a matter of much debate. The most commonly accepted theory for Ghana’s rapid decline is that the Berber Almoravid dynasty of North Africa invaded and conquered Ghana around 1100 and forced its rulers and people to convert to Islam. Some historians examining this issue have concluded that while Almoravid and Islamic pressures certainly disrupted the empire, weakening it enough for its incorporation into the rising Mali empire, there was no Almoravid military invasion and subsequent forced conversion to Islam.[10]

The Kingdom of Mali, ca. 1200–1450

Ghana and its capital of Koumbi Saleh were in decline between 1100 and 1200. The old empire split into several small kingdoms that feuded among themselves. One people, the Mandinka (man-DING-goh), from the kingdom of Kangaba on the upper Niger River, gradually asserted their dominance over these kingdoms. The Mandinka had long been part of the Ghanaian empire, and the Mandinka and Soninke belonged to the same language group. Kangaba formed the core of the new empire of Mali. Building on Ghanaian foundations, Mali developed into a better-organized and more powerful state than Ghana.

Mali owed its greatness to two fundamental assets. First, its strong agricultural and commercial base supported a large population and provided enormous wealth. Second, Mali had two rulers, Sundiata (soon-JAH-tuh) and Mansa Musa, who combined military success with exceptionally creative personalities.

The earliest surviving evidence about the Mandinka, dating from the early eleventh century, indicates that they were extremely successful at agriculture. Consistently large harvests throughout the twelfth and thirteenth centuries meant a plentiful food supply, which encouraged steady population growth. Kangaba’s geographical location also ideally positioned the Mandinka in the heart of the West African trade networks. Earlier, during the period of Ghanaian hegemony, the Mandinka had acted as middlemen in the gold and salt traffic flowing north and south. In the thirteenth century Mandinka traders formed companies, traveled widely, and gradually became a major force in the entire West African trade.

Mali’s founder, Sundiata (r. ca. 1230–1255), set up his capital at Niani, transforming the city into an important financial and trading center. He then embarked on a policy of imperial expansion. Through a series of military victories, Sundiata and his successors absorbed into Mali other territories of the former kingdom of Ghana and established hegemony over the trading cities of Gao, Jenne, and Walata.

The Expansion of Mali, ca. 1200–1450

These expansionist policies were continued in the fourteenth century by Sundiata’s descendant Mansa Musa (MAHN-sa MOO-sa) (r. ca. 1312–1337), early Africa’s most famous ruler. In the language of the Mandinka, *mansa* means “emperor.” Ultimately Mansa Musa’s influence extended northward to several Berber cities in the Sahara, eastward to the trading cities of Timbuktu and Gao, and westward to the Atlantic Ocean. Throughout his territories, he maintained strict royal control over the flourishing trans-Saharan trade. Thus this empire, roughly twice the size of the Ghanaian kingdom and containing perhaps 8 million people, brought Mansa Musa fabulous wealth.

Mansa Musa built on the foundations of his predecessors. Malian society’s stratified aristocratic structure perpetuated the pattern set in Ghana, as did the system of provincial administration and annual tribute. The emperor took responsibility for the territories that formed the heart of the empire and appointed governors to rule the outlying provinces and dependent kingdoms. But Mansa Musa made a significant innovation: in a practice strikingly similar to a system used in both China and France at the time, he appointed royal family members as provincial governors.

In another aspect of administration, Mansa Musa also differed from his predecessors. He became a devout Muslim. Although most of the Mandinka remained animists, Islamic practices and influences in Mali multiplied.

The Great Friday Mosque, Jenne The mosque at Jenne was built in the form of a parallelogram. Inside, nine long rows of adobe columns run along a north-south axis and support a flat roof of palm logs. A pointed arch links each column to the next in its row, forming nine east-west archways facing the *mihrab*, the niche in the wall of the mosque indicating the direction of Mecca, and from which the imam speaks. This mosque (rebuilt in 1907 based on the original thirteenth-century structure) testifies to the considerable wealth, geometrical knowledge, and manpower of Mali.

The most celebrated event of Mansa Musa’s reign was his pilgrimage to Mecca in 1324–1325, during which he paid a state visit to the Egyptian sultan. Mansa Musa’s entrance into Cairo was magnificent. Preceded by five hundred slaves, each carrying a six-pound staff of gold, he followed with a huge host of retainers, including one hundred elephants each bearing one hundred pounds of gold. The emperor lavished his wealth on the citizens of the Egyptian capital. Writing twelve years later, al-Omari, one of the sultan’s officials, recounts:

> This man Mansa Musa spread upon Cairo the flood of his generosity: there was no person, officer of the court, or holder of any office of the Sultanate who did not receive a sum of gold from him. The people of Cairo earned incalculable sums from him, whether by buying and selling or by gifts. So much gold was current in Cairo that it ruined the value of money.[11]

As a result of this pilgrimage, for the first time the Mediterranean world learned firsthand of Mali’s wealth and power, and the kingdom began to be known as one of the world’s great empires. Mali retained this international reputation into the fifteenth century. Musa’s pilgrimage also had significant consequences within Mali. He gained some understanding of the Mediterranean countries and opened diplomatic relations with the Muslim rulers of Morocco and Egypt. His zeal for the Muslim faith and Islamic culture increased. Musa brought back from Arabia the distinguished architect al-Saheli, whom he commissioned to build new mosques in Timbuktu and other cities. These mosques served as centers for African conversion to Islam.

Timbuktu began as a campsite for desert nomads, but under Mansa Musa it grew into a thriving entrepôt (trading center), attracting merchants and traders from North Africa and all parts of the Mediterranean world. They brought with them cosmopolitan attitudes and ideas. In the fifteenth century Timbuktu developed into a great center for scholarship and learning. Architects, astronomers, poets, lawyers, mathematicians, and theologians flocked there. One hundred fifty schools, for men only, were devoted to Qur’anic studies. The school of Islamic law enjoyed a distinction comparable to the prestige of the Cairo school (see “Education and Intellectual Life” in Chapter 9). The vigorous traffic in books that flourished in Timbuktu made them the most common items of trade. Timbuktu’s tradition and reputation for African scholarship lasted until the eighteenth century.

Timbuktu Originally a campsite for desert nomads, it grew into a thriving city under Mansa Musa, king of Mali and Africa’s most famous ruler

Moreover, in the fourteenth and fifteenth centuries many Arab and North African Muslim intellectuals and traders married native African women. The necessity of living together harmoniously, the traditional awareness of diverse cultures, and Timbuktu’s cosmopolitan atmosphere contributed to a rare degree of racial tolerance and understanding. After visiting the court of Mansa Musa’s successor in 1352–1353, Ibn Battuta observed:

> [T]he Negroes possess some admirable qualities. They are seldom unjust, and have a greater abhorrence of injustice than any other people. Their sultan shows no mercy to anyone who is guilty of the least act of it. There is complete security in their country. Neither traveler nor inhabitant in it has anything to fear from robbers.… They do not confiscate the property of any

> white man who dies in their country, even if it be uncounted wealth. On the contrary, they give it into the charge of some trustworthy person among the whites.[12]

The third great West African empire, Songhai, succeeded Mali in the fifteenth century. It encompassed the old empires of Ghana and Mali and extended its territory farther north and east to become one of the largest African empires in history (see Map 10.2).

Ethiopia: The Christian Kingdom of Aksum

Just as the ancient West African empires were significantly affected by Islam and the Arab culture that accompanied it, the African kingdoms that arose in modern Sudan and Ethiopia in northeast Africa were heavily influenced by Egyptian culture, and they influenced it in return. This was particularly the case in ancient Nubia (NOO-bee-uh). Nubia's capital was at Meroë (see Map 10.2); thus the country is often referred to as the Nubian kingdom of Meroë.

As part of the Roman Empire, Egypt was subject to Hellenistic and Roman cultural forces, and it became an early center of Christianity. Nubia, however, was never part of the Roman Empire; its people retained ancient Egyptian religious ideas. Christian missionaries traveled to the Upper Nile region and successfully converted the Nubian rulers around 600 C.E. By that time, there were three separate Nubian states, of which the kingdom of Nobatia, centered at Dongola, was the strongest. The Christian rulers of Nobatia had close ties with the **Aksum** (AHK-soom) kingdom in Ethiopia, and through this relationship Egyptian culture spread to Ethiopia.

Aksum A kingdom in northwestern Ethiopia that was a sizable trading state and the center of Christian culture

The Kingdom of Aksum, ca. 600

Two-thirds of Ethiopia consists of the Ethiopian highlands, the rugged plateau region of East Africa. The Great Rift Valley divides this territory into two massifs (mountain masses), of which the Ethiopian Plateau is the larger. Sloping away from each side of the Great Rift Valley are a series of mountains and valleys. Together with this mountainous environment, the three Middle Eastern religions — Judaism, Christianity, and Islam — have all influenced Ethiopian society.

By the first century C.E. the Aksum kingdom in northwestern Ethiopia was a sizable trading state. Merchants at Adulis (ah-DUL-uhs), its main port on the Red Sea, sold ivory, gold, emeralds, rhinoceros horns, shells, and slaves to the Sudan, Arabia, Yemen, and various cities across the Indian Ocean in exchange for glass, ceramics, fabrics, sugar, oil, spices, and precious gems. Adulis contained temples, stone-built houses, and irrigated agriculture. Between the first and eighth centuries Aksum served as the capital of an empire extending over much of what is now northern Ethiopia. The empire's prosperity rested on trade.

Islam's expansion into northern Ethiopia in the eighth century weakened Aksum's commercial prosperity. The Arabs first ousted the Greek Byzantine merchants who traded on the Dahlak Archipelago (in the southern Red Sea) and converted the islands' inhabitants. Then Muslims attacked and destroyed Adulis. Some Aksumites converted to Islam; many others found refuge in the rugged mountains north of the kingdom, where they were isolated from outside contacts. Thus began the insularity that characterized later Ethiopian society.

Christianity and Islam in Ethiopia The prolonged contest between the two religions in Ethiopia was periodically taken to the battlefield. This drawing from the eighteenth century by an Ethiopian artist shows his countrymen (left) advancing victoriously and celebrates national military success.

Tradition ascribes to Frumentius (froo-MEN-shee-uhs) (ca. 300–380 C.E.), a Syrian Christian trader, the introduction of Coptic (KAHP-tik) Christianity, an Orthodox form of Christianity that originated in Egypt, into Ethiopia. Kidnapped as a young boy en route from India to Tyre (in southern Lebanon), Frumentius was taken to Aksum, given his freedom, and appointed tutor to the future king, Ezana (ee-ZAHN-ah). Upon Ezana's accession to the throne, Frumentius went to Alexandria, Egypt, where he was consecrated the first bishop of Aksum around 328 C.E. He then returned to Ethiopia with some priests to spread Christianity. Shortly after members of the royal court accepted Christianity in about 350 C.E., it became the Ethiopian state religion. Ethiopia's future was to be inextricably linked to Christianity, a unique situation in sub-Saharan Africa.

Ethiopia's acceptance of Christianity led to the production of ecclesiastical documents and royal chronicles, making Ethiopia the first sub-Saharan African society that can be studied from written records. The

Scriptures were translated into Ge'ez (gee-EHZ), an ancient language and script used in Ethiopia and Aksum. Pagan temples were dedicated to Christian saints, and, as in early medieval Ireland and in the Orthodox Church of the Byzantine world, monasteries were the Christian faith's main cultural institutions in Ethiopia. As the Ethiopian state expanded, vibrant monasteries provided inspiration for the establishment of convents for nuns, as in medieval Europe (see "Monastic Life" in Chapter 14).

Monastic records provide fascinating information about early Ethiopian society. Settlements were formed on the warm and moist plateau lands. Farmers used a scratch plow (unique in sub-Saharan Africa) to cultivate wheat and barley, and they regularly rotated these cereals. Plentiful rainfall seems to have helped produce abundant crops, which in turn led to population growth. Because of ecclesiastical opposition to polygyny (the practice of having multiple wives), monogamy was the norm, other than for kings and the very rich. An abundance of land meant that young couples could establish independent households. Widely scattered farms, with the parish church as the central social unit, seem to have been the usual pattern of existence.

Above the broad class of peasant farmers stood warrior-nobles. Their wealth and status derived from their fighting skills, which kings rewarded with grants of estates and with the right to collect tribute from the peasants. To acquire lands and to hold warriors' loyalty, Ethiopian kings pursued a policy of constant territorial expansion. (See "Individuals in Society: Amda Siyon," page 275.) Nobles maintained order in their regions, supplied kings with fighting men, and displayed their superior status by the size of their households and their generosity to the poor.

Sometime in the fourteenth century six scribes in the Tigrayan (tee-GREY-uhn) highlands of Ethiopia combined oral tradition, Jewish and Islamic commentaries, apocryphal (noncanonical) Christian texts, and the writings of the early Christian Church fathers to produce the *Kebra Nagast* (The Glory of Kings). This history served the authors' goals: it became an Ethiopian national epic, glorifying a line of rulers descended from the Hebrew king Solomon (see "The Hebrews" in Chapter 2), arousing patriotic feelings, and linking Ethiopia's identity to the Judeo-Christian tradition. The book deals mostly with the origins of Emperor Menilek I (MEN-uh-lik) of Ethiopia in the tenth century B.C.E.

The *Kebra Nagast* asserts that Queen Makeda (ma-KAY-da) of Ethiopia (called Sheba in the Jewish tradition) had little governmental experience when she came to the throne. So she sought the advice and wise counsel of King Solomon (r. ca. 965–925 B.C.E.) in Jerusalem. (See "Analyzing the Evidence: The Queen of Sheba and King Solomon," page

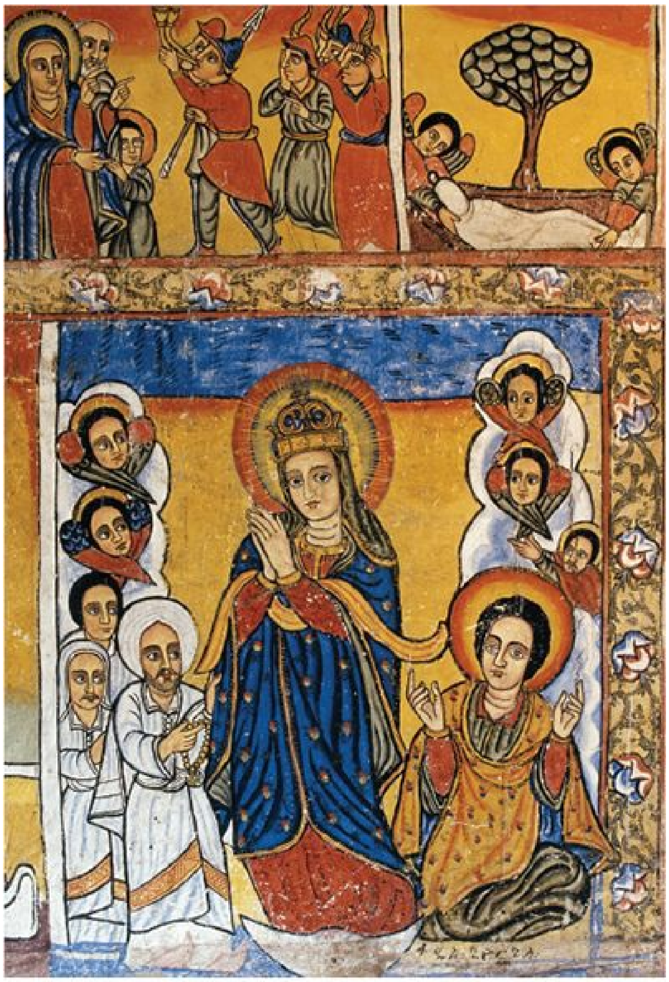
276.) Makeda learned Jewish statecraft, converted to Judaism, and expressed her gratitude to Solomon with rich gifts of spices, gems, and gold. During this visit, Solomon tricked Makeda into allowing him into her bed. Their son, Menilek, was born some months later. When Menilek reached maturity, he visited Solomon in Jerusalem. There Solomon anointed him crown prince of Ethiopia and sent a retinue of young Jewish nobles to accompany him home as courtiers. Unable to face life without the Hebrews' Ark of the Covenant, the courtiers stole the cherished wooden chest, which the Hebrews believed contained the Ten Commandments. God apparently approved the theft, for he lifted the youths, pursued by Solomon's army, across the Red Sea and into Ethiopia. Thus, according to the *Kebra Nagast*, Menilek avenged his mother's shame, and God gave his legal covenant to Ethiopia, Israel's successor.[13] Although written around twenty-three hundred years after the events, the myths and legends contained in the *Kebra Nagast* effectively served the purpose of building nationalistic fervor.

Based on this lineage, from the tenth to the sixteenth centuries, and even in the Ethiopian constitution of 1955, Ethiopia's rulers claimed they belonged to the Solomonic line of succession. Thus the church and state in Ethiopia were inextricably linked.

In the later thirteenth century the dynasty of the Solomonic kings witnessed a literary and artistic renaissance particularly notable for works of hagiography (biographies of saints), biblical exegesis (critical explanation or interpretation of the Bible), and manuscript illumination. The most striking feature of Ethiopian society from 500 to 1500 was the close relationship between the church and the state. Christianity inspired fierce devotion and equated doctrinal heresy with political rebellion, thus reinforcing central monarchical power.

INDIVIDUALS IN SOCIETY

Amda Siyon



De Agostini Picture Library/akg-images

Colorful biblical scenes adorn the interior of the Urai Kidane Miharet Church, one of the many monasteries established by Amda Siyon.

SCHOLARS CONSIDER AMDA SIYON (r. 1314–1344) THE greatest ruler of Ethiopia’s Solomonic dynasty. Yet we have no image or representation of him. We know nothing of his personal life, though if he followed the practice of most Ethiopian kings, he had many wives and children. Nor do we know anything about his youth and education. The evidence of what he did, however, suggests a tough military man who personified the heroic endurance and physical pain expected of warriors. According to a chronicle of Siyon’s campaign against the Muslim leader of Ifat,

> [Siyon] clove the ranks of the rebels and struck so hard that he transfixed two men as one with the blow of his spear, through the strength of God. Thereupon the rebels scattered and took to flight, being unable to hold their ground in his presence.

Amda Siyon reinforced control over his kingdom’s Christian areas. He then expanded into the neighboring regions of Shewa, Gojam, and Damot. Victorious there, he gradually absorbed the Muslim states of Ifat and Hedya to the east and southeast. These successes gave him effective control of the central highlands and also the Indian Ocean trade routes to the Red Sea (see Map 10.2). He governed in a quasi-feudal fashion. Theoretically the owner of all land, he assigned *gults*, or fiefs, to his ablest warriors. In return for nearly complete authority in their regions, these warrior-nobles conscripted soldiers for the king’s army, required agricultural services from the farmers working on their land, and collected taxes in kind.

Ethiopian rulers received imperial coronation at Aksum, but their kingdom had no permanent capital. Rather, the ruler and court were peripatetic. They constantly traveled around the country to crush revolts, to check the warrior-nobles’ management of the gults, and to impress ordinary people with royal dignity.

Territorial expansion had important economic and religious consequences. Amda Siyon concluded trade agreements with Muslims by which they were allowed to trade with his country in return for Muslim recognition of his authority and their promise to accept his administration and pay taxes. Economic growth followed. As a result of these agreements, the flow of Ethiopian gold, ivory, and slaves to Red Sea ports for export to the Islamic heartlands and to South Asia accelerated. Profits from commercial exchange improved people’s lives, or at least the lives of the upper classes.

Monk-missionaries from traditional Christian areas flooded newly conquered regions, stressing that Ethiopia was a new Zion, or a second Israel — a Judeo-Christian nation defined by religion. Ethiopian Christianity focused on the divinity of the Old Testament Yahweh, rather than on the humanity of the New Testament Jesus. Jewish dietary restrictions, such as the avoidance of pork and shellfish, shaped behavior, and the holy Ark of the Covenant had a prominent place in the liturgy. But the monks also taught New Testament values, especially the importance of charity and spiritual reform. Following the Byzantine pattern, the Ethiopian priest-king claimed the right to summon church councils and to issue doctrinal degrees. Christianity’s stress on monogamous marriage, however, proved hard to enforce. As in other parts of Africa (and in Islamic lands, China, and South Asia), polygyny remained common, at least among the upper classes.

QUESTIONS FOR ANALYSIS

1. What features mark Ethiopian culture as unique and distinctive among early African societies?
2. Referring to Solomonic Ethiopia, assess the role of legend in history.

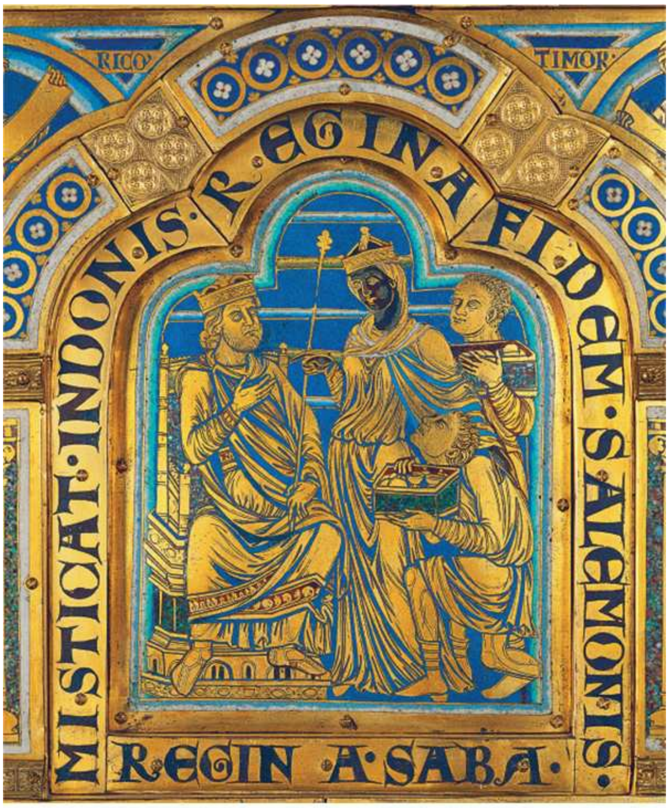
ANALYZING THE EVIDENCE

The Queen of Sheba and King Solomon



Erich Lessing/Art Resource, NY

Sheba, or Queen Makeda, figured prominently in European as well as Ethiopian art. Created in about 1180 by a French artist as part of a series of biblical scenes for an abbey in Austria, this image shows Solomon receiving gifts from Sheba's servants. The inscription surrounding the scene reads, "Solomon joins himself to the Queen of Sheba and introduces her to his faith."

Before the twelfth century Sheba was generally considered by Christian Europeans as a dark, mysterious, and even somewhat sinister figure. This view of her began to change in the twelfth century as the Old Testament story of King Solomon and the Queen of Sheba took on new Christian symbolism in medieval Europe. Medieval Christian iconography often imagined Solomon as Jesus the Messiah, and also as Divine Wisdom. Sheba now entered into the Western Christian tradition in several guises. She is sometimes portrayed as the Gentile (non-Jewish) Church, coming from a distant land to hear the divine knowledge from Solomon. As the representative of the Gentile population she submits to Solomon the Messiah, and there follows a holy marriage of the two. Sheba's chastity is also commonly represented as foreshadowing that of the Virgin Mary. In addition, an analogy is frequently made between the three gifts (gems, spices, and gold, as shown in this image) Sheba brought to Solomon and the three gifts (gold, frankincense, and myrrh) that the Magi, or Three Wise Men, brought to the baby Jesus. During this period the new symbolism was incorporated into many artistic renditions of the story, including sculptures and stained-glass windows in the great Gothic cathedrals at Chartres, Reims, Canterbury, and

Strasbourg.

QUESTIONS FOR ANALYSIS

1. What are King Solomon and Queen Sheba wearing and holding? How are the other figures depicted, and what are they doing?
2. What does the style of this image suggest about the background of the artist and about the audience for whom the image was intended?

The East African City-States

Like Ethiopia, the East African city-states were shaped by their proximity to the trade routes of the Red Sea and Indian Ocean. In the first century C.E. a merchant seaman from Alexandria in Egypt sailed down the Red Sea and out into the Indian Ocean, where he stopped at seaports along the coasts of East Africa, Arabia, and India. He took careful notes on all he observed, and the result, the *Periplus of the Erythraean Sea* (*erythraean* comes from the Greek word meaning "red," which was used to designate the Red Sea as well as the Indian Ocean), is the earliest surviving literary evidence of the city-states of the East African coast. (See "Global Viewpoints: Early Descriptions of Africa from Egypt," page 262.) Although primarily preoccupied with geography and navigation, the *Periplus* includes accounts of the local East African peoples and their commercial activities. Since the days of the Roman emperors, the *Periplus* testifies, the East African coast had strong commercial links with India and the Mediterranean.

Greco-Roman ships sailed from Adulis on the Red Sea around the tip of the Gulf of Aden and down the portion of the East African coast that the Greeks called Azania, in modern-day Kenya and Tanzania (see Map 10.2). These ships carried manufactured goods — cotton cloth, copper and brass, iron tools, and gold and silver plate. At the African coastal emporiums, Mediterranean merchants exchanged these goods for cinnamon, myrrh and frankincense, captive slaves, and animal byproducts such as ivory, rhinoceros horns, and tortoise shells. The ships then headed back north and, somewhere around Cape Guardafui (gwahr-duh-FWEE) on the Horn of Africa, caught the monsoon winds eastward to India, where ivory was in great demand. In the early centuries of the Common Era many merchants and seamen from the Mediterranean settled in East African coastal towns. Succeeding centuries saw the arrival of more traders. The great emigration from Arabia after the death of Muhammad accelerated Muslim penetration of the area, which the Arabs called the Zanj, "land of the blacks," a land inhabited by Bantu-speaking peoples whom they also called the Zanj. Along the coast, Arabic Muslims established small trading colonies whose local peoples were ruled by kings and practiced various animistic religions. Eventually — whether through Muslim political hegemony or gradual assimilation — the coastal peoples slowly converted to Islam. Indigenous African religions, however, remained strong in the continent's interior. (See "Analyzing the Evidence: A Tenth-Century Muslim Traveler Describes Parts of the East African Coast," above.)

Migrants from the Arabian peninsula and the Malay Archipelago had a profound influence on the lives of the East African coastal people. Beginning in the late twelfth century fresh waves of Arabs and of Persians from Shiraz poured down the coast, first settling at Mogadishu, then pressing southward to Kilwa. Everywhere they landed, they introduced Islamic culture to the indigenous population. Similarly, from the first to the fifteenth centuries Indonesians crossed the Indian Ocean and settled on the African coast and on the large island of Madagascar. All these immigrants intermarried with Africans, and the resulting society combined Asian, African, and especially Islamic traits. The East African coastal culture was called **Swahili**, after a Bantu language whose vocabulary and poetic forms exhibit a strong Arabic influence.

Swahili The East African coastal culture, named after a Bantu language whose vocabulary and poetic forms exhibit strong Arabic influences

By the late thirteenth century **Kilwa** had become the most powerful Swahili coastal city, exercising political hegemony as far north as Pemba and as far south as Sofala (see Map 10.2). In the fourteenth and fifteenth centuries the coastal cities were great commercial empires, comparable to the Italian city-state of Venice (see Chapter 14). Like Venice, Swahili cities such as Kilwa, Mombasa (mohm-BAHS-uh), and Pemba were situated on offshore islands. The tidal currents that isolated them from the mainland also protected them from landside attack.

Kilwa The most powerful city on the east coast of Africa by the late thirteenth century

Much current knowledge about life in the East African trading societies rests on the account of Ibn Battuta. He described Kilwa as "one of the finest and most substantially built towns; all the buildings are of wood, and the houses are roofed with al-dis [reeds]."[14] On the mainland were fields and orchards of rice, millet, oranges, mangoes, and bananas and pastures and yards for cattle, sheep, and poultry. Yields were apparently high; Ibn Battuta noted that the rich enjoyed three enormous meals a day and were very fat.

From among the rich mercantile families that controlled the coastal cities arose rulers who governed both the main city and surrounding territory. Such was the case with the island city of Kilwa and the nearby mainland. These rulers took various titles, including king, sultan, and sheik.

Approaching the East African coastal cities in the late fifteenth century, Portuguese traders were astounded at their enormous wealth and prosperity. This wealth rested on the ruler's monopolistic control of all trade in the area. Some coastal cities manufactured goods for export, such as cloth and iron tools. The bulk of the cities' exports, however, consisted of animal products — leopard skins, tortoise shell, ambergris, ivory — and gold. The gold originated in the Mutapa region south of the Zambezi River, where the Bantu mined it. As in tenth-century Ghana, gold was a royal monopoly in the fourteenth-century coastal city-states. Kilwa's prosperity rested on its traffic in gold.

Copper Coin from Mogadishu, Twelfth Century Islamic proscriptions against representation of the human form prevented the use of rulers' portraits on coinage, unlike the practice of the Romans, Byzantines, and Sassanids. Instead Islamic coins since the Umayyad period were decorated exclusively with writing. Sultan Haran Ibn Suleiman of Kilwa on the East African coast minted this coin, a symbol of the region's Muslim culture and of its rich maritime trade.

African goods satisfied the global aristocratic demand for luxury goods. In Arabia leopard skins were made into saddles, shells were made into combs, and ambergris was used in the manufacture of perfumes. Because African elephants' tusks were larger and more durable than those of Indian elephants, African ivory was in great demand in India for sword and dagger handles, carved decorative objects, and the ceremonial bangles used in Hindu marriage rituals. Wealthy Chinese also valued African ivory for use in sedan chair construction. In exchange for these natural products, the Swahili cities brought in, among many other items, incense, glassware, glass beads, and carpets from Arabia; textiles, spices, rice, and cotton from India; and grains, fine porcelain, silk, and jade from China.

Slaves were another export from the East African coast. Reports of East African slave trading began with the publication of the *Periplus*. The trade accelerated with the establishment of Muslim settlements in the eighth century and continued up through the arrival of the Portuguese in the late fifteenth century, which provided a market for African slaves in the New World (see Chapter 15). In fact, the global slave market fueled the East African coastal slave trade until at least the beginning of the twentieth century.

As in West Africa, traders obtained slaves primarily through raids and kidnapping. The Arabs called the northern Somalia coast *Ras Assir* (Cape of Slaves). From there, Arab traders transported slaves northward up the Red Sea to the markets of Arabia and Persia. Muslim dealers also shipped blacks from the Zanzibar (ZAN-zuh-bahr) region across the Indian Ocean to markets in India.

As early as the tenth century sources mention persons with “lacquer-black bodies” in the possession of wealthy families in Song China.[15] In 1178 a Chinese official noted in a memorial to the emperor that Arab traders were shipping thousands of blacks from East Africa to the Chinese port of Guangzhou (Canton) by way of the Malay Archipelago.

It appears, however, that in Indian, Chinese, and East African markets, slaves were never as valuable a commodity as ivory. Thus the volume of the Eastern slave trade did not approach that of the trans-Saharan slave trade.[4]

Giraffe Brought to China from East Africa In

1414 envoys from Chinese admiral Zheng He’s fleet visited the Swahili coastal city of Malindi (now in Kenya) and were presented with a giraffe as tribute. The giraffe was taken back to China, where it became a wondrous sensation, particularly because it was associated with the *qilin* (CHI-lin), a Chinese mythical figure that is a cross between a horse and a dragon. The qilin is said to have two or three horns, as does the giraffe (two), and scaly skin, which explains the artist’s rendering of the giraffe’s hide.

ANALYZING THE EVIDENCE

A Tenth-Century Muslim Traveler Describes Parts of the East African Coast

Other than Ethiopia, early African societies left no written accounts, so modern scholars rely on the chronicles of travelers and merchants. These outsiders, however, come with their own preconceptions, attitudes, and biases. They tend to measure what they visit and see by the conditions and experiences with which they are familiar.

In the early tenth century the Muslim merchant-traveler Al Mas’udi (d. 945), in search of African ivory, visited Oman, the southeast coast of Africa, and Zanzibar. He referred to all the peoples he encountered as Zanj, a term that he also applied to the maritime Swahili culture of the area’s towns. Al Mas’udi’s report, excerpted here, offers historians a wealth of information about these peoples and places.

Omani seamen cross the strait [of Berbera, off northern Somalia] to reach Kanbalu island [perhaps modern Pemba], located in the Zanj sea. The island’s inhabitants are a mixed population of Muslims and idolatrous Zanj…. I have sailed many seas, the Chinese sea, the Rum sea [Mediterranean], the Khazar [Caspian Sea], the Kolzom [Red Sea], and the sea of Yemen. I have encountered dangers without number, but I know no sea more perilous than the Zanj. Here one encounters a fish called el-Owal [whale]…. The sailors fear its approach, and both day and night strike pieces of wood together or beat drums to drive it away…. Ambergris* is found in great quantities along the Zanj coast…. The best ambergris is found in the islands and on the shores of the Zanj sea: it is round, of a pale blue tint, sometimes the size of an ostrich egg. Lumps of it are swallowed by the whale…. When the sea becomes very rough the whale vomits up large rock size balls of ambergris. When it tries to gulp them down again it chokes to death and its body floats to the surface. Quickly the Zanj, … having waited for such a favorable moment, draw the fish near with harpoons and tackle, cut open its stomach, and extract the ambergris. The pieces found in its intestines emit a nauseating odor, … but the fragments found near the back are much purer as these have been longer inside the body….

The lands of the Zanj provide the people with wild leopard skins that they wear and that they export to Muslim countries. These are the largest leopard skins and make the most beautiful saddles. The Zanj also export tortoise-shell for making combs, and ivory … likewise…. The giraffe is the most common animal found in these lands…. They [the Zanj] settled in this country and spread south to Sofala, which marks the most distant frontier of this land…. Just as the China sea ends with Japan, the limits of the Zanj sea are Sofala and the Waqwaq, a region with a warm climate and fertile soil that produces gold in abundance and many other marvelous things. Here the Zanj built their capital and chose their king, whom they call *Mfalme,* the traditional title for their sovereigns. The *Mfalme* rules over all other Zanj kings and commands 300,000 cavalrymen. The Zanj employ the ox as a beast of burden, for their country contains no horses, mules, or camels, and they do not even know of these animals. Nor do they know of snow or hail…. The territory of the Zanj commences where a branch diverts from the upper Nile and continues to Sofala and the Waqwaq. Their villages extend for about 700 parasangs in length and breadth along the coast. The country is divided into valleys, mountains, and sandy deserts. Wild elephants abound, but you will not see a single tame one. The Zanj employ them neither for war nor for anything else…. When they want to catch them, they throw into the water the leaves, bark, and branches of a particular tree; then they hide in ambush until the elephants come to drink. The tainted water burns them and makes them drunk, causing them to fall down and be unable to get up. The Zanj then rush upon them, armed with very long spears, and kill them for their tusks. Indeed, the lands of the Zanj produce tusks each weighing fifty pounds and more. They generally go to Oman, and are then sent on to China and India. These are the two primary destinations, and if they were not, ivory would be abundant in Muslim lands.

In China the kings and military and civil officers ride in ivory palanquins:† no official or dignitary would dare to enter the royal presence in an iron palanquin. Thus they prefer straight tusks to curved…. They also burn ivory before their idols and incense their altars with its perfume, just as Christians use the Mary incense and other scents in their churches. The Chinese derive no other benefit from the elephant and believe it brings bad fortune when used for domestic purposes or war. In India ivory is much in demand. There dagger handles, as well as curved sword-scabbards, are fashioned from ivory. But ivory is chiefly used in the manufacture of chessmen and backgammon pieces….

Although the Zanj are always hunting the elephant and collecting its ivory, they still make no use of ivory for their own domestic needs. For their finery they use iron rather than gold and silver, and oxen, as we mentioned above, as beasts of burden or for war, as we use camels or horses. The oxen are harnessed like horses and run at the same speed.

To return to the Zanj and their kings, these are known as *Wfalme,* meaning son of the Great Lord. They refer thus to their king because he has been selected to govern them fairly. As soon as he exerts tyrannical power or strays from the rule of law they put him to death and exclude his descendants from accession to the throne. They claim that through his wrongful actions he ceases to be the son of the Master, that is, the King of Heaven and Earth. They give God the name *Maliknajlu*, meaning the Sovereign Master.

The Zanj express themselves eloquently and have preachers in their own language. Often a devout man will stand in the center of a large crowd and exhort his listeners to render themselves agreeable to God and to submit to his commands. He depicts for them the punishments their disobedience exposes them to, and recalls the example of their ancestors and former kings. These people possess no religious code: their kings follow custom and govern according to traditional political practices.

The Zanj eat bananas, as abundant here as they are in India; but their dietary staples are millet and a plant called *kalari*, which is pulled from the earth like truffles. It is similar to the cucumber of Egypt and Syria. They also eat honey and meat. Every man worships what he pleases, be it a plant, an animal or a mineral.‡ The coconut grows on many of the islands: its fruit is eaten by all the Zanj peoples. One of these islands, situated one or two days' sail off the coast, contains a Muslim population and a hereditary royal family. This is the island of Kanbalu, which we have already mentioned.

QUESTIONS FOR ANALYSIS

1. What does Al Mas'udi's report tell us about the Zanj peoples and their customs? How would you describe his attitude toward them?
2. What commodities were most sought after by Muslim traders? Why? Where were they sold?

Southern Africa and Great Zimbabwe

Southern Africa, bordered on the northwest by the Kalahari Desert and on the northeast by the Zambezi (zam-BEE-zee) River (see Map 10.2), enjoys a mild and temperate climate. Desert conditions prevail along the Atlantic coast. Eastward toward the Indian Ocean rainfall increases, amounting to fifty to ninety inches a year in some places. Temperate grasslands characterize the interior highlands. Considerable variations in climate occur throughout much of southern Africa from year to year.

Southern Africa has enormous mineral resources: gold, copper, diamonds, platinum, and uranium. Preindustrial peoples mined some of these deposits in open excavations down several feet, but fuller exploitation required modern technology.

Southern Africa has a history that is very different from those of West Africa, the Nile Valley, and the East African coast. Unlike the rest of coastal Africa, southern Africa remained far removed from the outside world until the Portuguese arrived in the late fifteenth century — with one important exception. Bantu-speaking people reached southern Africa in the eighth century. They brought skills in ironworking and mixed farming (settled crop production plus cattle and sheep raising) and immunity to the kinds of diseases that later decimated the Amerindians of South America (see Chapter 16).

The earliest residents of southern Africa were hunters and gatherers. In the first millennium C.E. new farming techniques from the north arrived. Lack of water and timber (both needed to produce the charcoal used in iron smelting) slowed the spread of iron technology and tools and thus of crop production in southwestern Africa. These advances reached the western coastal region by 1500. By that date, Khoisan-speakers were tending livestock in the arid western regions. To the east, descendants of Bantu-speaking immigrants grew sorghum, raised cattle and sheep, and fought with iron-headed spears.

The nuclear family was the basic social unit among early southern African peoples, who practiced polygyny and traced descent in the male line. Several families formed bands numbering between twenty and eighty people. Such bands were not closed entities; people in neighboring territories identified with bands speaking the same language. As in most preindustrial societies, a division of labor existed whereby men hunted and women cared for children and raised edible plants. People lived in caves or in camps made of portable material, and they moved from one watering or hunting region to another as seasonal or environmental needs required.

In 1871 a German explorer came upon the ruined city of **Great**

Zimbabwe southeast of what is now Masvingo (mahz-VING-goh) in Zimbabwe. (See “Thinking Like a Historian: Great Zimbabwe,” page 282.) The ruins consist of two vast complexes of dry-stone buildings, a fortress, and an elliptically shaped enclosure commonly called the Temple. Stone carvings, gold and copper ornaments, and Asian ceramics once decorated the buildings. The ruins extend over sixty acres and are encircled by a massive wall. The entire city was built from local granite between the eleventh and fifteenth centuries without any outside influence. Archaeologists consider Great Zimbabwe the most impressive monument in Africa south of the Nile Valley and the Ethiopian highlands.

Mapungubwe Golden Rhino The kingdom of Mapungubwe (1075–1220), in modern South Africa on the Limpopo River, was a precursor to the great kingdom of Great Zimbabwe to its north. Like that kingdom, it traded gold and ivory to the coast that eventually reached Egypt, India, and China. Several golden objects have been found at the site, including this famous gold foil rhinoceros, which displays the superb craftsmanship of Mapungubwe goldsmiths a thousand years ago.

These ruins tell a remarkable story. Great Zimbabwe was the political and religious capital of a vast empire. During the first millennium C.E. settled crop cultivation, cattle raising, and work in metal led to a steady buildup in population in the Zambezi-Limpopo region. The area also contained a rich gold-bearing belt. Gold ore lay near the surface; alluvial gold lay in the Zambezi River tributaries. In the tenth century the inhabitants collected the alluvial gold by panning and washing; after the year 1000 the gold was worked in open mines with iron picks. Traders shipped the gold eastward to Sofala (see Map 10.2). Great Zimbabwe's wealth and power rested on this gold trade.

Great Zimbabwe declined in the fifteenth century, perhaps because the area had become agriculturally exhausted and could no longer support the large population. Some people migrated northward and settled in the Mazoe River Valley, a tributary of the Zambezi. This region also contained gold, and the settlers built a new empire in the tradition of Great Zimbabwe. This empire's rulers were called Mwene Mutapa (m-WEY-nee muh-TUH-pa), and their power was also based on the gold trade down the Zambezi River to Indian Ocean ports. It was this gold that the Portuguese sought when they arrived on the East African coast in the late fifteenth century.

THINKING LIKE A HISTORIAN

Great Zimbabwe

Historians of Africa's past, often lacking written sources, must turn to other research fields such as archaeology, anthropology, linguistics, oral tradition, botany, and zoology. One of the enduring enigmas today is the massive ruins at Great Zimbabwe, in modern Zimbabwe, whose construction began in the eleventh century. Scholars debate who built them and what parts of the ruins were used for. The site appears to have been abandoned sometime in the late fifteenth century, but it is not clear why it was vacated or what happened to the people who lived there. How might a historian respond to the questions raised by this silent witness to a great chapter in African history?

1 **João de Barros, *Da Asia*, 1552.** The first written reference to Great Zimbabwe comes from a history published in 1552 by João de Barros. Barros was a Portuguese historian who had never visited the site but learned of it from Swahili traders. Barros called it "Symbaoe."

■ There are other [gold] mines in a district called Toróa … and they are all in the plain, in the midst of which there is a square fortress. Of masonry within and without, built of stones of marvelous size, and … no mortar joining them. The wall is more than twenty-five spans in width…. This edifice is almost surrounded by hills, upon which are others resembling it in the fashioning of the stone and the absence of mortar, and one of them is a tower more than twelve fathoms high.

The natives of the country call all these edifices Symbaoe, which according to their language signifies court…. It is guarded by a nobleman, and there are always some of the [king's] wives therein…. When, and by whom, these edifices were raised, as the people of the land are ignorant of the art of writing, there is no record, but they [Arabs] say they are the work of the devil, for in comparison with their power and knowledge it does not seem possible to them that they should be the work of man.

In the opinion of the [Arabs] who saw it, it is very ancient, and was built there to keep possession of the mines, which are very old, and no gold has been extracted from them for years, because of the wars.

2 **The Great Enclosure.** The Great Enclosure's walls are up to 36 feet high and up to 18 feet thick, and they stretch for about 820 feet in length. The largest ancient structure in sub-Saharan Africa, rivaled only by the Egyptian pyramids, it contains an estimated 1 million granite bricks, laid together without mortar.

3 **Inside the Great Enclosure.** None of the walls of the complex are straight, as illustrated here by the curved wall and the Conical Tower. The tower is 33 feet high and 16 feet in diameter at its base, and then it tapers to a diameter of 6½ feet at the top.

4 **The Hill Complex, looking across the valley to the Great Enclosure and beyond.** The Hill Complex is the oldest of the structures at Great Zimbabwe and dates from the ninth to the thirteenth centuries. Archaeologists believe that the Zimbabwe Birds originally stood on this site.

5 **Soapstone Zimbabwe Bird.** Six of these carved soapstone birds were found at the site, and they are now Zimbabwe’s national symbol. Standing about 16 inches tall on 3-foot-tall columns, they resemble the African fish eagle.

ANALYZING THE EVIDENCE

1. By comparing Barros’s account in Source 1 and the images included here, what references in his text might lead a historian to believe that Barros was writing about Great Zimbabwe?
2. The images in Sources 2 and 3 reflect the great skill and craftsmanship required to build such a massive complex. What mathematical skills would the builders have needed? How would one organize the workers and craftsmen for such a huge undertaking? What type of influence (for example, religious) over the people would the rulers have needed to keep this project going for over three hundred years?
3. Some scholars refer to the Hill Complex in Source 4 as the “Fortress.” Why might that be?
4. The sandstone bird sculpture pictured in Source 5 is one of eight unique to Great Zimbabwe. What might be the religious or political significance of these sculptures, given that we have no contemporary written discussions of them and that the birds are not used as symbols by the indigenous peoples today?

PUTTING IT ALL TOGETHER

Using the sources above, along with what you have learned in class and in this chapter, write a short essay about the power, wealth, and governing abilities of the kings of Great Zimbabwe. What does this kingdom have in common with the great empires of West Africa discussed in this chapter?

Chapter Summary

Africa is a huge continent with many different climatic zones and diverse geography. The African peoples are as varied as the topography. North African peoples were closely connected with the Middle Eastern and European civilizations of the Mediterranean basin. New crops introduced from Asia and the adoption of agriculture profoundly affected early societies across western and northeastern Africa as they transitioned from hunting and gathering in small bands to settled farming communities. Beginning in modern Cameroon and Nigeria, Bantu-speakers spread across central and southern Africa over a period of more than two thousand years. Possessing iron tools and weapons, domesticated livestock, and a knowledge of agriculture, these Bantu-speakers assimilated, killed, or drove away the region's previous inhabitants.

Africans in the West African Sahel participated in the trans-Saharan trade, which affected West African society in three important ways: it stimulated gold mining; it increased the demand for West Africa's second-most-important commodity, slaves; and it stimulated the development of large urban centers in West Africa.

Similarly, the Swahili peoples in city-states along the East African coast traded with Arabia, the Persian Gulf, India, China, and the Malay Archipelago. They depended on Indian Ocean commercial networks, which they used to trade African products for luxury items from Arabia, Southeast Asia, and East Asia. Great Zimbabwe, in southern Africa's interior, traded gold to the coast for the Indian Ocean trade.

The Swahili city-states and the Western Sudan kingdoms were both part of the Islamic world. Arabian merchants brought Islam with them as they settled along the East African coast, and Berber traders brought Islam to West Africa. Differing from its neighbors, Ethiopia formed a unique enclave of Christianity in the midst of Islamic societies. The majority of Bantu-speaking peoples of Great Zimbabwe and central and southern Africa were neither Islamic nor Christian.

CONNECTIONS

Africa was an integral part of the vast trans-Saharan and Indian Ocean trading networks that stretched from Europe to China. This trade brought wealth to African kingdoms, empires, and city-states that developed alongside the routes. But the trade in ideas more profoundly connected the growing African states to the wider world, most notably through Islam, which had arrived by the seventh century, and Christianity, which developed a foothold in Ethiopia. Prior to the late fifteenth century Europeans had little knowledge about African societies. All this would change during the European Age of Discovery. Chapter 16 traces the expansion of Portugal from a small, poor European nation to an overseas empire, as it established trading posts and gained control of the African gold trade. Portuguese expansion led to competition, spurring Spain and then England to strike out for gold of their own in the Americas. The acceleration of this conquest would forever shape the history of Africa and the Americas (see Chapters 11 and 15) and intertwine them via the African slave trade that fueled the labor needs of the colonies in the Americas.

Review the Main Ideas

Answer the focus questions from each section of the chapter.

1. How did Africa's geography shape its history and contribute to its diverse population? (p. 260)
2. How did agriculture affect life among the early societies in the western Sudan and among the Bantu-speaking societies of central and southern Africa? (p. 261)
3. What characterized trans-Saharan trade, and how did it affect West African society? (p. 265)
4. How were the East African city-states, Aksum, and Great Zimbabwe different from and similar to the kingdoms of the western Sudan? (p. 269)

Make Comparisons and Connections

Analyze the larger developments and continuities within and across chapters.

1. How did the geography and size of Africa affect African societies and their contact with the rest of the world?
2. What different cultures influenced the African people living along the continent's eastern coast?
3. Based on the discussion in Chapter 9 on the spread of Islam and what you learned in this chapter, how did Islam influence the different societies of

West and East Africa?

4. How might the Bantu migrations compare with earlier migrations, such as the Indo-European migrations discussed in Chapter 2 or the Barbarian migrations discussed in Chapter 8?

Wuneven. Isolation from other world societies made peoples of the Americas vulnerable to diseases found elsewhere in the world. When indigenous peoples were exposed to these diseases through contact with Europeans, the devastating effects of epidemics facilitated European domination. But this exchange also brought into global circulation the results of thousands of years of work by peoples of the Americas in plant domestication that changed diets worldwide, making corn, potatoes, and peppers into the daily staples of many societies.

Domestication of these crops intensified farming across the Americas that sustained increasingly complex societies. At times these societies grew into vast empires built on trade, conquest, and tribute. Social stratification and specialization produced lands not just of subjects and kings, but of priests, merchants, artisans, scientists, and engineers who achieved extraordinary feats.

In Mesoamerica (MAY-so-america) — the region stretching from present-day central Mexico to Nicaragua — the dense urban centers of Maya, Teotihuacan (TAY-oh-tee-hwa-can), Toltec, and Aztec city-states and empires featured great monuments, temples, and complex urban planning. Roadways and canals extended trade networks that reached from South America to the Great Lakes region of North America. Precise calendars shaped religious, scientific, medical, and agricultural knowledge.

In the Andes, the mountain range that extends from southernmost present-day Chile north to Colombia and Venezuela, peoples adapted to the mountain range's stark vertical stratification of climate and ecosystems to produce agricultural abundance similar to that of Mesoamerica. Andean technological, agricultural, and engineering innovations allowed people to make their difficult mountain terrain a home rather than a boundary.

Societies of the Americas in a Global Context

How did ancient peoples of the Americas adapt to, and adapt, their environment?

Like people everywhere, civilizations of the Americas interpreted the meaning of the world and their place in the cosmos. They organized societies stratified not just by gender, class, and ethnicity but also by professional roles and wealth, and they adapted to and reshaped their physical and natural world. But they did all this on their own, without outside influences and within a distinct environment.

If the differences between the civilizations in the Americas and other world regions are remarkable, the similarities are even more so. By studying the peoples of the Americas before their encounters with other world societies, we gain a clearer view of universal aspects of the human experience.

Trade and Technology

The domestication of crops and animals created an abundance of food and livestock, which allowed people to take on new social roles and to develop specialized occupations. As cities emerged, they became hubs of a universal human activity: trade. These cities were home to priests who interpreted the nature of the world, as well as a nobility from which kings emerged, some of whom forged vast empires.

The differences in the development and application of three different kinds of technologies — the wheel, writing and communications systems, and calendars — capture this essential nature of human adaptability.

Because of conditions specific to the Americas, societies in Mesoamerica and the Andes did not use wheels for transportation before their encounters with other world peoples that began in 1492. In Mesoamerica there were no large animals like horses or oxen to domesticate as beasts of burden, so there was no way to power wagons or chariots. In the Andes, domesticated llamas and alpacas served as pack animals and were a source of wool and meat. But in the most densely settled, cultivated, and developed areas, the terrain was too difficult for wheeled transportation. Instead Andean peoples developed extensive networks of roads that navigated steep changes in altitude, supported by elaborate suspension bridges made from woven vegetable fibers.

Peoples of the Americas also did not develop alphabetical writing systems, but this did not mean they did not communicate in writing or record information. If we separate our understanding of the alphabetical reading you are doing right now from its functions — communicating and storing information — we can appreciate the ways in which Andean and **Mesoamerican** civilizations accomplished both. Peoples of the Americas spoke thousands of languages (hundreds are still spoken today). Mesoamericans, beginning with the Olmecs (1500–300 B.C.E.), used phonograms, characters that represent sound, and logograms, characters that represent words or ideas, similar to those of ancient Egyptian hieroglyphs or Japanese kanji. Later civilizations wrote books on paper and deerskin, some of which have survived to the present.

Mesoamerica The term used to designate the area spanning present-day central Mexico to Nicaragua

The Andean innovation for recording information was particularly remarkable. The **khipu** (KEY-pooh) was an assemblage of colored and knotted strings. Differences in color and type of knot, as well as the knots' order and placement, served as a binary system akin to a contemporary computer database. Khipus were used to record demographic, economic, and political information that allowed imperial rulers and local leaders to understand and manage complex data across a vast empire.

Inca Khipu Khipus like these were used by communities and by Inca imperial officials to store and communicate data. The dyes, weaves, and knots made by their users recorded data much like contemporary binary computer storage, allowing users to read information about populations, production, and tribute.

Mesoamerican peoples used a sophisticated combination of calendars. These were based on a Calendar Round that combined a 365-day solar calendar with a 260-day lunar calendar based on the numbers thirteen and twenty, which were sacred to peoples of Mesoamerica. Annual cycles were completed when twenty 13-day bundles converged with thirteen 20-day bundles. Together with the solar calendar, these formed a 52-year cycle whose precision was unsurpassed in the premodern world. It also provided an incredibly intricate mechanism not only for following the solar and lunar years but also for connecting these to aspects of daily life and religion. The calendars helped users interpret their world.

Settlement and Environment

The ancient settlers of the Americas migrated from Asia, though their timing and their route are debated. One possibility is that the first settlers migrated across the Bering Strait from what is now Russia to Alaska and gradually migrated southward sometime between 15,000 and 13,000 B.C.E. But archaeological excavations have identified much earlier settlements, perhaps dating to up to 20,000–30,000 years ago, along the Andes in South America than they have for Mesoamerica or North America. Evidence from some settlements suggest the possibility that seafaring migration may have also occurred.

Like early settlers elsewhere in the world, populations of the Americas could be divided into three categories: nomadic peoples, semi-sedentary farming communities, and dense agricultural communities capable of sustaining cities. Over time, urban settlement and empire formation centered on two major regions. The first area was the region around Lake Titicaca, where the Inca Empire (1438–1532) originated. Located at the present-day border between Peru and Bolivia, Lake Titicaca is the highest lake in the world (12,500 feet high) and the largest lake in South America (3,200 square miles). The second area was the Valley of Mexico on the central plateau of Mesoamerica, where empires such as the Aztec Empire (1428–1521) formed cities around Lake Texcoco. Access to these large freshwater lakes allowed agriculture to expand through irrigation, which in turn supported growing urban populations.

The earliest farming settlements emerged around 10,000 B.C.E. when communities began the long process of domesticating and modifying plants, including squash, maize (corn), potatoes, peppers, and beans. The origins of maize in Mesoamerica are unclear, though it became a centerpiece of the Mesoamerican diet and spread across the Americas. Eaten together with beans, maize provided Mesoamerican peoples with a diet sufficient in protein despite the scarcity of meat. Mesoamericans processed kernels through **nixtamalization**, boiling the maize in a solution of water and mineral lime. The process broke down compounds in the kernels, increasing their nutritional value, while enriching the resulting *masa*, or paste, with dietary minerals including calcium, potassium, and iron.

The masa could be cooked with beans, meat, or other ingredients to make tamales. It could also be rolled flat on a stone called a *metate* (MAY-tah-teh) and baked into tortillas. Tortillas played roles similar to those of bread in wheat-producing cultures: they could be stored, they were light and easy to transport, and they were used as the basic building block of meals. Aztec armies of the fifteenth century could travel long distances because they carried tortillas for sustenance. Along an army's route, communities were obligated to provide tribute in tortillas.

Andean peoples cultivated another staple of the Americas, the potato. Potatoes first grew wild, but selective breeding produced many different varieties. For Andean peoples, potatoes became an integral part of a complex system of cultivation at varying altitudes. Communities created a system of "vertical archipelagos" through which they took advantage of the changes of climate along the steep escarpments of the Andes. Different crops could be cultivated at different altitudes, allowing communities to engage in intense and varied farming in what would otherwise have been inhospitable territory.

Communities raised multiple crops and engaged in year-round farming by working at different altitudes located within a day's journey from home. Some of these zones of cultivation were so distant — sometimes over a week's journey — that they were tended by temporary or permanent colonies, called *mitmaq*, of the main settlement.

At higher elevations, members of these communities cultivated potatoes. Arid conditions across much of the altiplano (AL-tee-plan-oh), or high-plains plateau, meant that crops of potatoes could sometimes be planted only every few years. But the climate — dry with daily extremes of heat and cold — could be used to freeze-dry potatoes that could be stored indefinitely. Above the potato-growing zone, shepherds tended animals such as llamas and alpacas, which provided wool and dried meat, or *ch'arki* (the origin of the word *jerky*). They also served as pack animals that helped farmers bring in the crops from their high- and low-altitude plots. The animals' manure served as fertilizer for farming at lower altitudes.

At middle altitudes, communities used terraces edged by stone walls to extend cultivation along steep mountainsides to grow corn. In the lowlands, communities cultivated the high-protein grain quinoa, as well as beans, peppers, and coca. Farmers chewed coca (the dried leaves of a plant native to the Andes from which cocaine is derived) to alleviate the symptoms of strenuous labor at extremely high altitudes. Coca also added nutrients such as calcium to the Andean diet and played an important role in religious rituals. In the lowlands communities also grew cotton, and in coastal areas they harvested fish and mussels. Fishermen built inflatable rafts made of sealskin. Communities specialized in the types of production their ecosystems allowed.

Ancient Societies

What patterns established by early societies shaped civilization in Mesoamerica and the Andes?

Between 1500 and 1200 B.C.E. emerging civilizations in Mesoamerica and the Andes established lasting patterns of production, culture, and social organization that would long influence societies of the Americas. In Mesoamerica, Olmec civilization laid the foundation for future empires. The imprint of Olmec civilization spread across long networks of trade that would one day extend from Central America to the Mississippi Valley and the Great Lakes of North America. In the Andes, Chavín and Moche civilizations formed the early part of a long cycle of centralization and decentralization. This political and economic centralization helped spread technology, culture, and religion.

Olmec Agriculture, Technology, and Religion

The **Olmecs** were an early civilization that shaped the religion, trade practices, and technology of later civilizations in Mesoamerica. They flourished in the coastal lowlands of Mexico from 1500 to 300 B.C.E. The Olmecs formed the first cities of Mesoamerica, and these cities served as centers of agriculture, trade, and religion (Map 11.1). Through long-distance trade, the Olmecs spread their culture and technology across Mesoamerica, establishing beliefs and practices that became common to the civilizations that followed.

MAP 11.1 The Olmecs, ca. 1500–300 B.C.E. Olmec civilization flourished in the coastal lowlands of southern Mexico along the Caribbean coast. Olmec patterns of settlement, culture, religion, organization, and trade are known almost solely through excavation of archaeological sites.

The Olmecs settled along rivers in the coastal lowlands, where they cultivated maize, squash, beans, and other plants. They supplemented their diet with wild game and fish. But they lacked many other resources. In particular, they carried stone for many miles for the construction of temples and for carving massive monuments, many in the shape of heads. Across far-flung networks the Olmecs traded rubber, cacao (from which chocolate is made), pottery, and jaguar pelts, as well as the services of artisans such as painters and sculptors, in exchange for obsidian, a volcanic glass that could be carved to a razor-sharp edge and used for making knives, tools, spear tips, and other weapons.

These ties between the Olmecs and other communities spread religious practices, creating a shared framework of beliefs among later civilizations. These practices included the construction of large pyramid temples, as well as sacrificial rituals. Olmec deities, like those of their successors, were combinations of gods and humans, included merged animal and human forms, and had both male and female identities. People practicing later religions based their gods on a fusion of human and spirit traits along the lines of the Olmec were-jaguar: a half-man, half-jaguar figure.

The Olmecs also used a solar calendar with a 365-day year. This calendar begins with the year 3114 B.C.E., though its origins and the significance of this date are unclear. Archaeologists presume that the Olmecs combined the solar calendar with a 260-day lunar calendar, to form the combined Calendar Round. All the later Mesoamerican civilizations used at least one of these calendars, and most used both of them.

Hohokam, Hopewell, and Mississippian Societies

Mesoamerican trading networks extended into southwestern North America, where by 300 B.C.E. the Hohokam people and other groups were using irrigation canals, dams, and terraces to enhance their farming of arid lands (Map 11.2). Like the Olmecs and other Mesoamerican peoples, the Hohokam built ceremonial platforms and played games with rubber balls that were traded over a long distance in return for turquoise and other precious stones. Along with trade goods came religious ideas, including the belief in local divinities who created, preserved, and destroyed. The Mesoamerican Feathered Serpent god became important to desert peoples. They planted desert crops such as agave, as well as cotton and maize that came from Mexico. Other groups, including the Anasazi (ah-nah-SAH-zee), the Yuma, and later the Pueblo and Hopi, also built settlements in this area using large sandstone blocks and masonry to construct thick-walled houses that offered protection from the heat. Mesa Verde, the largest Anasazi town, had a population of about twenty-five hundred living in houses built into and on cliff walls. Roads connected Mesa Verde to other Anasazi towns, allowing timber and other construction materials to be brought in more easily. Eventually drought, deforestation, and soil erosion led to decline in both the Hohokam and Anasazi cultures.

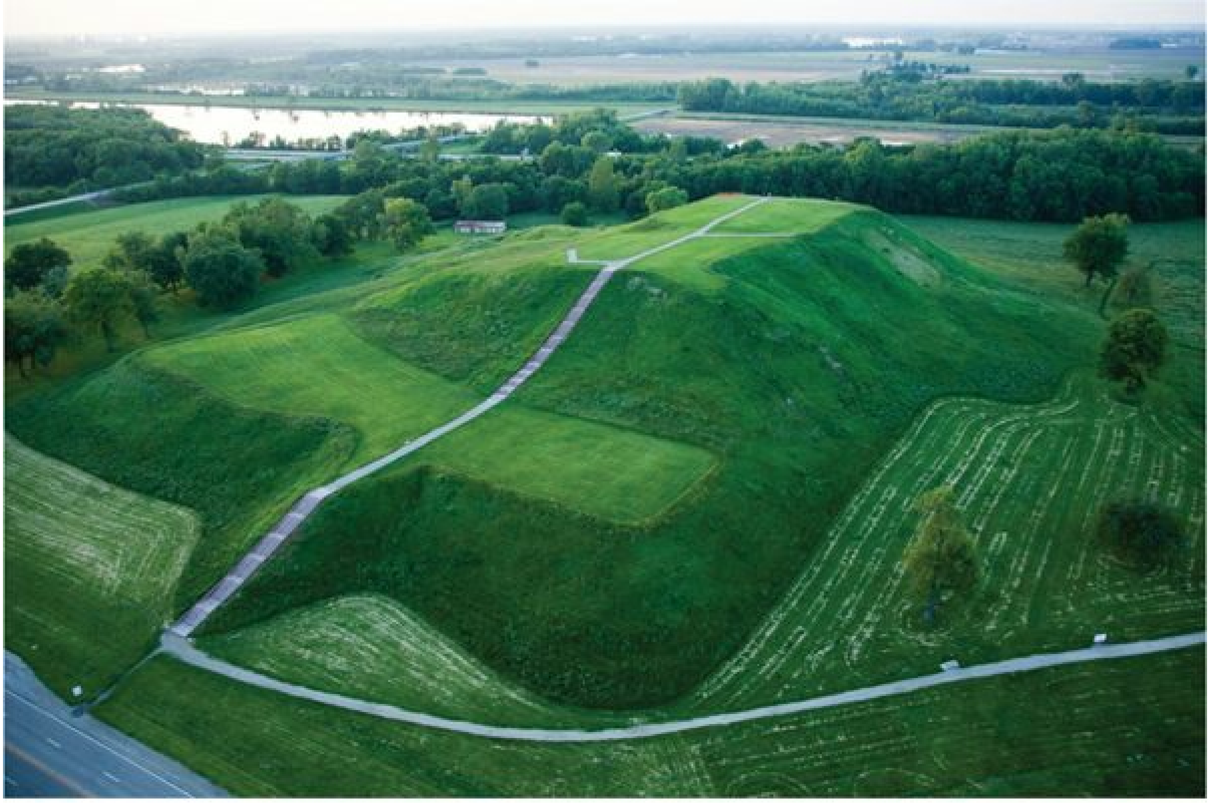
MAP 11.2 Major North American Agricultural Societies, ca. 600–1500 C.E. Many North American groups used agriculture to increase the available food supply and allow greater population density and the development of urban centers. This map shows three of these cultures: the Mississippian, Anasazi, and Hohokam.

In eastern North America, mound building began around 5500 B.C.E. One of the most important mound-building cultures was the Hopewell (200 B.C.E.–600 C.E.), named for a town in Ohio near the site of the most extensive mounds. Some mounds were burial chambers. Other mounds formed animal or geometric figures. Hopewell earthworks also included canals that enabled trading networks to expand, bringing products from the Caribbean far into the interior. Those trading networks also carried maize, allowing more intensive agriculture to spread throughout the eastern woodlands of North America.

At Cahokia (kuh-HOE-kee-uh), near the confluence of the Mississippi and Missouri Rivers in Illinois, archaeologists have identified the largest mound complex in North America, part of a ceremonial center and city that may have housed nearly forty thousand people. Work on this complex of mounds, plazas, and houses — which covered 5½ square miles —

began about 1050 C.E. and was completed about 1250 C.E. A fence of wooden posts surrounded the center of the complex. Several hundred mounds inside and outside the fence served as tombs and as the bases for temples and palaces. The largest mound rose in four stages to a height of one hundred feet and was nearly one thousand feet long. On its top stood a large building, used perhaps as a temple.



Ira Block/National Geographic Creative

Cahokia Mounds in Illinois Monks Mound is located in Cahokia, the largest Mississippian settlement. The pyramid is nearly 100 feet tall and 1,000 feet long, making it the largest constructed structure north of Mesoamerica.

Cahokia trade reached far across North America. Mississippian mound builders relied on agriculture to support their complex cultures, and by the time Cahokia was built, maize agriculture had spread to the Atlantic coast. Particularly along riverbanks and the coastline, fields of maize, beans, and squash surrounded large, permanent villages containing many houses, all encompassed by walls made of earth and timber.

At its peak in about 1150 Cahokia was the largest city north of Mesoamerica. However, its construction stripped much of the surrounding countryside of trees, which made spring floods worse and eventually destroyed much of the city. An earthquake in the thirteenth century furthered the destruction, and the city never recovered. The worsening climate of the fourteenth century, which brought famine to Europe, probably also contributed to Cahokia’s decline, and its population dispersed.

Kinship and Ancestors in the Andes

In the Andes social organization and religion shaped ideas of spiritual kinship as well as patterns of production and trade. The *ayllu* (IGH-you), or clan, served as the fundamental social unit of Andean society. Kinship was based on a shared ancestor and on worship of *huaca*, sacred spaces or things that had spiritual characteristics and were sometimes linked to ancestors. Huaca were often a part of the landscape, such as a spring or stone. Members of an ayllu considered their huaca as more than a spirit: it owned the lands the ayllu’s farmers tended, and it served as the center of community obligations such as the pooling of labor.

Ancestor worship provided the foundations of Andean religion and spirituality, served as the basis of authority, and guided food production. All members of the ayllu owed allegiance to *kurakas*, or clan leaders, who typically traced the most direct lineage to an ancestor identified with a huaca. This lineage made them both temporal and spiritual leaders of their ayllu. An Andean family’s identity came from membership in an ayllu’s ancestral kinship, and its subsistence came from participation in the broader community’s shared farming across vertical climate zones. People often labored collectively and reciprocally.

Archaeologists periodize Andean history in cycles of centralization and decentralization. There were three great periods of centralization, which archaeologists call the Early, Middle, and Late Horizon. The Late Horizon, which included the Inca Empire, was the briefest, cut short by the Spanish conquest (see “Conquest and Settlement” in Chapter 16). The first period, the Early Horizon (ca. 1200–200 B.C.E.), centered on the people of Chavín (chah-VEEN), upland from present-day Lima. The Chavín spread their religion along with technologies for the weaving and dyeing of wool and cotton. Weaving became the most widespread means of recording and representing information in the Andes.

After the end of the Early Horizon, regional states emerged, including **Moche** (MOH-cheh) civilization, which flourished along a 250-mile stretch of Peru’s northern coast between 100 and 800 C.E. The Moche people developed complex irrigation systems, with which they raised food crops and cotton. Each Moche valley contained a large ceremonial center with palaces and pyramids surrounded by settlements of up to ten thousand people. Their dazzling gold and silver artifacts, as well as elaborate headdresses, display great skill in pottery and metalwork.

Moche A Native American culture that thrived along Peru’s northern coast between 100 and 800 C.E.

Politically, the Moche were organized into a series of small city-states rather than one unified state, and warfare was common among them. Beginning about 500 the Moche suffered several severe El Niños, changes in ocean current patterns in the Pacific that bring searing drought and flooding. They were not able to respond effectively to the devastation, and their urban population declined.

Pan-Andean cultures re-emerged during the Middle Horizon (500–1000 C.E.), centered to the south in Tiwanaku (TEE-wan-ah-kooh), in Lake Titicaca, and to the north at Wari, near present-day southern Peru. The city-state of Wari’s dominion stretched from the altiplano north of Lake Titicaca to the Pacific coast, drawing on Moche culture. Its reach between mountain and coastal regions led to extensive exchanges of goods and beliefs. The city-state of Tiwanaku extended its influence in the other direction, south of the lake. Both Wari and Tiwanaku practiced ancestor worship, and Tiwanaku religion centered on the figure of Viracocha, the god creator and father of humanity, who was identified with the sun and storms.

Storms and climate shifts were central to Andean people’s worldview because changes in climate, particularly abrupt changes brought by El Niño, could devastate whole civilizations. El Niño disrupted Moche culture and contributed to the decline of Wari and Tiwanaku. As the Middle Horizon ended, the cities of Tiwanaku and Wari endured on a smaller scale, but between 1000 and 1200 C.E. they lost their regional influence. The eras between the Early, Middle, and Late Horizon, known as Intermediate Periods, were times of decentralization in which local cultures and practices re-emerged. It was out of these local developments that new centralizing empires would over time emerge.

The Incas

What were the sources of strength and prosperity, and of problems, for the Incas?

Inca was the name of the governing family of the largest and last Andean empire. The empire, whose people we will call the Incas, was called Tawantinsuyu (TAH-want-een-soo-you), meaning “from the four parts, one,” expressing the idea of a unified people stretching in all directions.

Inca The name of the dynasty of rulers who built the largest and last indigenous empire across the Andes

The Inca Model of Empire

In the Late Intermediate Period (1200–1470), the Pan-Andean influences of Wari and Tiwanaku waned. City-states around Lake Titicaca competed and fought. The strongest ones again emerged. To the north, the Chimu claimed the legacy of the Moche and Wari. To the south, the city of Cuzco became the hub of a growing kingdom under the hereditary control of the Incas (Map 11.3). The ways Inca rulers adapted techniques of statecraft from Wari and religious practices from Titicaca gave them powerful tools that helped them build their empire.

Mapping the Past

MAP 11.3 **The Inca Empire, 1532** Andean peoples turned their stark mountain landscape to their advantage by settling and farming in vertical archipelagos. Settlements were located at temperate altitudes, while farming and herding took place at higher and lower altitudes.

ANALYZING THE MAP In what ways did Andean peoples turn their mountain landscape from an obstacle into a resource?

CONNECTIONS What types of geographic features did other peoples of the Americas, or peoples in other regions of the world, adapt to their advantage? How did adaptation to their geography shape those societies?

In the 1420s Viracocha Inca emerged as the first Inca leader to attempt permanent conquest. Unlike the *sinchis* (SEEN-cheese), or kings, of other city-states, Viracocha Inca fashioned himself an emperor and, in adopting the name Viracocha, connected himself to the god of creation. Around 1438 rivals invaded Viracocha Inca's territories and he fled. His son, Pachacuti, remained in Cuzco and fended off the invaders. He crowned himself emperor and embarked on a campaign of conquest. Pachacuti Inca conquered the Chimu and incorporated beliefs and practices from this northern civilization.

After conquering the Chimu, Pachacuti instituted practices that expanded the empire across the Andes. He combined Andean ancestor worship with the Chimu system of a split inheritance, a combination that drove swift territorial expansion and transformed Tawantinsuyu into one of the largest empires in the world. Under the system of ancestor worship, the Incas believed the dead emperor's spirit was still present, and they venerated him through his mummy. Split inheritance meant that the dead emperor retained all the lands he had conquered, commanded the loyalty of all his subjects, and continued to receive tribute. A *panaqa* (pan-AH-kah), a trust formed by his closest relatives, managed both the cult of his mummy and his temporal affairs. Chimu split inheritance became a basic structure of the empire's organization.

When the ruler died, his corpse was preserved as a mummy in elaborate clothing and housed in a sacred and magnificent chamber. A sixteenth-century account of the death of Pachacuti Inca in 1471 described the practices for burying and honoring him:

> He was buried by putting his body in the earth in a large new clay urn, with him very well dressed. Pachacuti Inca [had] ordered that a golden image made to resemble him be placed on top of his tomb. And it was to be worshiped in place of him by the people who went there…. [He had] ordered those of his own lineage to bring this statue out for the feasts that were held in Cuzco. When they brought it out like this, they sang about the things that the Inca did in his life, both in the wars and in his city. Thus they served and revered him, changing its garments as he used to do, and serving it as he was served when

he was alive.[1]

The panaqa of descendants of each dead ruler managed his lands and used his income to care for his mummy, maintain his cult, and support themselves, all at great expense. When a ruler died, one of his sons was named the new Inca emperor. He received the title, but not the lands and tribute — nor, for that matter, the direct allegiance of the nobility, bound as it was to the deceased ruler. The new emperor built his own power and wealth by conquering new lands.

Inca Imperial Expansion

The combination of ancestor worship and split inheritance provided the logic and impulse for expanding Inca power. The desire for conquest provided incentives for courageous (or ambitious) nobles: those who succeeded in battle and gained new territories for the state could expect to receive lands, additional wives, servants, herds of llamas, gold, silver, and other status symbols. Common soldiers who distinguished themselves could be rewarded and raised to noble status. Under Pachacuti Inca and his successors, Inca domination was extended by warfare to the frontier of present-day Ecuador and Colombia in the north and to present-day Chile in the south, an area of about 350,000 square miles. Eighty provinces, scores of ethnic groups, and 16 million people came under Inca control.

The Incas integrated regions they conquered by spreading their language and their gods. Magnificent temples housed images of these gods. Priests led prayers and elaborate rituals, and during occasions such as natural disasters or military victories they sacrificed humans. The Incas' official language, **Quechua** (KEH-chuh-wah), spread across the empire. Along with another major Andean language, Aymara, it is still spoken by millions in Peru, Bolivia, and regions of Ecuador, Argentina, and Chile.

Quechua The official language of the Incas, it is still spoken by most Peruvians today

Pressure for growth strained the Inca Empire. Conquerable lands became scarce, so the Incas directed their attentions to the tropical Amazon forest east of the Andes — an effort that led to military disasters. Inca armies traditionally waged combat in massed formation, often engaging in hand-to-hand combat. But in dense jungles armies could not maneuver or maintain order against enemies who used guerrilla tactics.

Another source of stress came from revolts among subject peoples in conquered territories. Even the system of roads and message-carrying runners couldn't keep up with the administrative needs of the empire. The average runner could cover about 175 miles per day — a remarkable feat of physical endurance, especially at a high altitude — but as the empire grew, so did the distances communication needed to cover. The round trip from the capital at Cuzco to Quito in Ecuador, for example, took ten to twelve days, so an emperor might have to base urgent decisions on incomplete or out-of-date information. The empire was overextended.

Imperial Needs and Obligations

At its height, the Inca Empire extended over 2,600 miles. The challenges of sustaining an empire with that reach, not to mention one built so fast, required extraordinary resourcefulness. The Inca Empire met these demands by adapting aspects of local culture to meet imperial needs. For instance, the empire demanded that the ayllus, the local communities with shared ancestors, include imperial tribute in the rotation of labor and the distribution of harvested foods. In return, community leaders received goods from the empire. (See “Analyzing the Evidence: Felipe Guaman Poma de Ayala, *The First New Chronicle and Good Government*,” at right.)

As each Inca emperor conquered new lands and built his domain, he mobilized people and resources by drawing on local systems of labor and organization. Much as ayllus developed satellite communities called mitmaq to take advantage of remote farming areas, the emperor relocated families or even whole villages over long distances to consolidate territorial control or quell unrest. What had been a community practice became a tool of imperial expansion. The emperor sent mitmaq settlers, known as *mitmaquisuna*, far and wide, creating diverse ethnic enclaves. Inca rulers and nobles also married the daughters of elite families among the peoples they conquered.

The reciprocal labor carried out within ayllus expanded into a labor tax called the *mit’a* (MEE-tuh), which rotated among households in an ayllu throughout the year. Tribute paid in labor provided the means for building the infrastructure of empire. Rotations of laborers carried out impressive engineering projects, allowing the vast empire to extend over the most difficult and inhospitable terrain. An excellent system of roads facilitated the movement of armies and the rapid communication of royal orders by runners.

Weaving for Tribute Felipe Guaman Poma de Ayala’s line drawing shows a woman weaving fine cloth on a back-strap loom. The drawing indicates that the woman is “weaving for tribute,” which in Poma de Ayala’s time would have been paid to the Spaniards, continuing a traditional obligation of providing tribute to Inca rulers.

Like Persian and Roman roads, these feats of engineering linked an empire. On these roads Inca officials, tax collectors, and accountants traveled throughout the empire, using elaborate khipus to record financial and labor obligations, the output of fields, population levels, land transfers, and other numerical records. Only around 650 khipus are known to survive today, because colonial Spaniards destroyed them, believing khipus might contain religious messages that conflicted with their efforts to impose Christianity.

ANALYZING THE EVIDENCE

Felipe Guaman Poma de Ayala, *The First New Chronicle and Good Government*

Felipe Guaman Poma de Ayala (1550?–1616) came from a mixed background — his father was a Spaniard and his mother was from a noble indigenous family in Peru. He spoke Quechua, Aymara, and Spanish and was baptized as a Christian. As an assistant to a Spanish friar and a Spanish judge, he saw firsthand the abuses of the Spanish authorities in what had been the Inca Empire. In the early seventeenth century he began writing and illustrating what became his masterpiece, a handwritten book of almost eight hundred pages of text and nearly four hundred line drawings addressed to the king of Spain that related the history of the Inca Empire and the realities of Spanish rule. He hoped to send the book to Spain, where it would convince the king to make reforms that would bring about the "good government" of the book's title. (The book apparently never reached the king, though it did make its way to Europe. It was discovered in the Danish Royal Library in Copenhagen in 1908.) In the following section, Guaman Poma sets out certain traditional age-group categories of Inca society, which he terms "paths," ten for men and ten for women.

■ The first path was that of the brave men, the soldiers of war. They were thirty-three years of age (they entered this path as young as twenty-five, and left it at fifty). These brave men were held very much apart and distinguished in every manner possible. The Inca [the Inca ruler] selected some of these Indians to serve in his battles and wars. He selected some from among these brave Indians to settle as *mitmaqs* (foreigners) in other provinces, giving them more than enough land, both pasture and cropland, to multiply, and giving each of them a woman from the same land. He did this to keep his kingdom secure; they served as overseers….

The Fifth Path was that of the *sayapayac* [those who stand upright]. These were the Indians of the watch, aged from eighteen to twenty years. They served as messenger boys between one pueblo and another, and to other nearby places in the valley. They also herded flocks, and accompanied the Indians of war and the great lords and captains. They also carried food….

The Eighth Path was that of boys aged from five to nine years. These were the "boys who play" (*puellacoc wamracuna*). They served their mothers and fathers in whatever ways they could, and bore many whippings and thumpings; they also served by playing with the toddlers and by rocking and watching over the babies in cradles….

The Tenth Path was that of those called *wawa quirawpi cac* (newborn babies at the breast, in cradles), from the age of one month. It is right for others to serve them; their mothers must necessarily serve them for no other person can give milk to these children….

The First Path was that of the married women and widows called *auca camayocpa warmin* [the warriors’ women], whose occupation is weaving fine cloth for the Inca, the other lords, the captains, and the soldiers. They were thirty-three years of age when they married; up until then, they remained virgins and maidens…. These wives of brave men were not free [from tribute obligations]. These women had the occupation of weaving fine *awasca* cloth and spinning yarn; they assisted the commons in their pueblos and provinces, and they assisted with everything their titled noble lords decreed….

The Sixth Path was that of those called *coro tasqui-cunas, rotusca tasqui*, which means “young girls with short-cropped hair.” They were from twelve to eighteen years of age and served their fathers, mothers, and grandmothers. They also began to serve the great ladies so that they could learn to spin yarn and weave delicate materials. They served as animal herders and workers in the fields, and in making *chica* [corn beer] for their fathers and mothers, and they assisted in other occupations insofar as they could, helping out … they were filled with obedience and respect, and were taught to cook, spin, and weave. Their hair was kept cropped until they reached the age of thirty, when they were married and given the dowry of their destitution and poverty.

The Seventh Path was that of the girls called flower pickers…. They picked flowers to dye wool for *cumpis*, cloth, and other things, and they picked the edible herbs mentioned above, which they dried out and stored in the warehouse to be eaten the following year. These girls were from nine to twelve years of age….

The Ninth Path was that of the girls aged one and two, who were called *llucac warmi wawa* (“young girls who crawl”). They do nothing; instead, others serve them. Better said, they ought to be served by their mothers, who should be exempt [from tribute] because of the work of raising their children. Their mothers have to walk around carrying them, and never let go of their hands.

QUESTIONS FOR ANALYSIS

1. The “First Path” among both men and women is the one with the highest status. Judging by the way Guaman Poma describes the paths, what do the Incas especially value? How do his descriptions of other paths support your conclusions about this?
2. In what ways are the paths set out for boys and men different from those for girls and women? In what ways are they similar? What does this suggest about Inca society?
3. Guaman Poma wrote this about eighty years after the Spanish conquest of Peru. How do the date and the colonial setting affect your evaluation of this work as a source?

The Maya and Teotihuacan

How did the Maya and Teotihuacan develop prosperous and stable societies in the classical era?

In Mesoamerica the classical period (300 C.E.–900 C.E.) saw major advances in religion, art, architecture, and farming, akin to those of the classical civilizations of the Mediterranean. Long-lasting city-states rose in **Maya** regions between 300 C.E. and 900 C.E. City-states also developed in the Valley of Mexico, where **Teotihuacan** emerged as a major center of trade between 300 C.E. and 650 C.E. The classical period was followed by the postclassical Toltec Empire (900–1174 C.E.), which adapted the cultural, ritual, and aesthetic practices that influenced later empires like the Aztecs.

Teotihuacan The monumental city-state that dominated trade in classical era Mesoamerica

Maya Agriculture and Trade

The Maya inhabited the highlands of Guatemala and the Yucatán peninsula in present-day Mexico and Belize. Their physical setting shaped two features of Maya society. First, the abundance of high-quality limestone allowed them to build monumental architecture. Second, limestone formations created deep natural wells called *cenotes* (say-NOH-tehs), which became critical sources of water in an often-arid environment. Cenotes were essential to farming and also became important religious and spiritual sites. The staple crop of the Maya was maize, often raised in small remote plots called *milpas* in combination with other foodstuffs, including beans, squash, chili peppers, root crops, and fruit trees.

Chichén Itzá Pyramid This pyramid served as the temple to Kukulkan, the Maya expression of the Feathered Serpent deity known to the Aztecs as Quetzalcoatl. Eighty feet tall and 180 feet across, it served as the ceremonial and physical center of the city of Chichén Itzá, located in Mexico’s Yucatán peninsula.

The entire Maya region may have had as many as 14 million inhabitants. Sites like Uxmal, Uaxactún, Copán, Piedras Negras, Tikal, Palenque, and Chichén Itzá (Map 11.4) emerged as independent city-states, each ruled by a hereditary king. These cities featured ornate temples, engraved pillars, palaces for nobles, pyramids where nobles were buried, and courts for ball games. A hereditary nobility owned land, exercised political power, and directed religious rituals. Artisans and scribes made up the social level below. Other residents were farmers, laborers, and slaves, the latter including prisoners of war.

MAP 11.4 The Maya World, 300–900 C.E. The Maya built dozens of cities linked together in trading networks of roads and rivers. Only the largest of them are shown here.

At Maya markets, jade, obsidian, beads of red spiny oyster shell, lengths of cloth, and cacao beans — all in high demand in the Mesoamerican world — served as media of exchange. The extensive trade among Maya communities, plus a common language, promoted unity among the peoples of the region. Merchants traded beyond Maya regions, particularly with the Zapotecs of Monte Albán, in the Valley of Oaxaca, and with the Teotihuacanos of the central valley of Mexico. Since this long-distance trade played an important part in international relations, the merchants conducting it were high nobles or even members of the royal family.

Maya Science and Religion

The Maya developed the most complex writing system in the Americas, a script with nearly a thousand glyphs. They recorded important events and observations in books made of bark paper and deerskin, on pottery, on stone pillars called steles, and on buildings. The inscriptions include historical references that record events in the lives of Maya kings and nobles. As was common for elites everywhere, Maya leaders stressed the ancient ancestry of their families. (See “Analyzing the Evidence: The Maya Calendar,” page 303.)

Few Maya books survived the wrath of sixteenth-century Spanish religious authorities, who viewed the books as heretical and ordered them destroyed. A handful survived, offering a window into religious rituals and practices, as well as Maya astronomy. From observation of the earth’s movements around the sun, the Maya used a calendar of eighteen 20-day months and one 5-day month, for a total of 365 days, along with the 260-day lunar calendar based on 20 weeks of 13 days. When these calendars coincided every 52 years, the Maya celebrated with feasting, ball-game competitions, and religious observances that included blood sacrifice by kings to honor the gods.

The Maya devised a form of mathematics based on the vigesimal (20) rather than the decimal (10) system. More unusual was their use of the number zero, which allows for more complex calculations. The Maya’s proficiency with numbers made them masters of abstract knowledge — notably in astronomy and mathematics.

Between the eighth and tenth centuries the Maya abandoned their cultural and ceremonial centers. Archaeologists attribute their decline to a combination of warfare and agricultural failures due to drought and land exhaustion. Decline did not mean disappearance. The Maya ceased building monumental architecture around 900 C.E., which likely marked the end of the era of rule by powerful kings who could mobilize the labor required to build it. The Maya persisted in farming communities, a pattern of settlement that helped preserve their culture and language in the face of external pressures.

Maya communities resisted invasions from warring Aztec armies by dispersing from their towns and villages and residing in their milpas during invasions. When Aztec armies entered the Yucatán peninsula or the highlands of what is today Guatemala, communities vanished, leaving Aztec armies with nothing to conquer. This tactic continued to serve Maya communities under Spanish colonial rule. Though Spaniards claimed the Yucatán, the Maya continued to use the strategy that had served them so well in resisting the Aztecs. Many communities avoided Spanish domination for generations. The last independent Maya kingdom succumbed only in 1697, and resistance continued well into the nineteenth century.

The Maya, like other Mesoamerican peoples, used a 365-day solar calendar and a 260-day lunar calendar. They recorded dates by using both calendars, expressed either in a 52-year cycle, known as a Calendar Round, or using a linear calendar beginning in a year corresponding with 3114 B.C.E. The carving here records a date using the Long Count calendar that is equivalent to February 11, 526 C.E.

The date appears as part of a carving that formed part of the ceremonial complex in the classical period Maya city of Yaxchilan, located in present-day Chiapas in southern Mexico. Towering over the Usumacinta River, Yaxchilan was the home to powerful kings who ordered the story of their dynasty told through exquisitely engraved lintels above doorways, like this one, and on stone slabs known as steles.

The lintel date marks the beginning of a king’s reign. The date is rendered through the images of animals and deities that correspond with the Maya Long Count calendar. The monkey (right column, second from top) signals a day date. The day is defined by the god’s head in its hand, which means 6, and the skull beneath the hand, which means 10: or 16 days. Above the monkey is Hun Hunaphu, the god of maize. To the left of the monkey is Yax Balam, deity of the moon, and below Yax Balam is Hun Ahau, a hero tied to the underworld. Beneath the monkey figure, the two dots correspond with the number 2. Numbers were expressed though a system of bars and dots in which a single bar equals 5 and a single dot equals 1. The chart here shows the Maya means of representing numbers 1 to 19. The buildings of Maya cities were densely inscribed with such carvings that celebrated the reign of kings, depicted their ancestry, and commemorated feats in battle.

QUESTIONS FOR ANALYSIS

1. Calendars show not only dates but also the sense of time of the people who used them. What do the figures in this calendar show you about the Maya and their world?
2. How does the Maya system of numbers resemble other numerical systems with which you are familiar?
3. What does this carving show us about the kinds of uses the calendar served?

Teotihuacan and the Toltecs

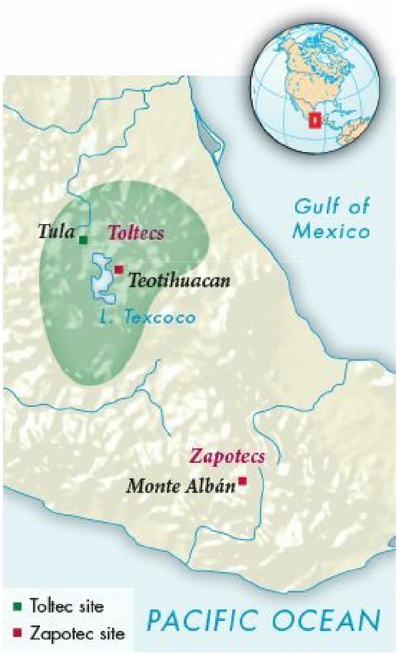
The most powerful city in classical Mesoamerica emerged at Teotihuacan, northwest of the lands of the Maya. At its height, between 300 and 600 C.E., its population reached as high as 250,000, making it one of the largest cities in the world at that time. The heart of Teotihuacan was a massive ceremonial center anchored by a colossal Pyramid of the Sun, 700 feet wide and 200 feet tall, and a Pyramid of the Moon. Connecting them was the Avenue of the Dead, 150 feet wide and 2 miles long, along which stood the homes of scores of priests and lords. The monuments of Teotihuacan were so massive that centuries later the Aztecs thought they had been built by giants. A cave under the Pyramid of the Sun suggests the ceremonial center's origins. Caves symbolized the womb from which the sun and moon were born. It is possible that it emerged like other pilgrimage sites around the world that became important marketplaces.[2]

The monuments of the ceremonial district of Teotihuacan were matched in grandeur by the city's markets, which extended its influence across Mesoamerica. The city's trade empire lay in its control of a resource vital to Mesoamerican society and religion: obsidian, a glasslike volcanic rock that could be worked into objects with both material and spiritual uses. Obsidian knives were used for daily tasks and for important rituals such as the blood sacrifice practiced by the Maya.[3]

Religion accompanied trade. Teotihuacan was a religious and cultural center whose influence extended over large distances. One factor in the city's success was its ethnic diversity. Teotihuacan grew through the migration of outsiders along trade networks, and these groups built separate ethnic neighborhoods. Two gods that were particularly important to classical period civilizations were Tlaloc (Chac in Maya), the god of rain, and Quetzalcoatl, the plumed serpent. (See "Thinking Like a Historian: Feathers, Snakes, and Humans," page 304.) The worship of these deities became an enduring aspect of Mesoamerican religion that the Toltecs and the Aztecs embraced.[4]

Teotihuacan thrived as a commercial and religious hub because it controlled trade of the most valuable goods. This combination helped Teotihuacan grow, and in turn the trade networks it sustained helped other regions in Mesoamerica develop through contact with other groups and the spread of technologies. Over time, improvements in other regions decreased Teotihuacan's comparative advantage, as its trading partners produced increasingly valuable goods, spurring competition. By 600 its influence had begun to decline, and in 650 the residents of the city seem to have burned its ceremonial center in what may have been a revolt against the city's leadership. The city had ceased to be a major trade center by 900 C.E.[5]

The Toltecs (900–1200 C.E.) filled the void created by Teotihuacan's decline. The Toltecs inaugurated a new era, the postclassical, which ended with the Spanish conquest of the Aztec Empire. The postclassical period saw fewer technological or artistic advances. Instead it was a time of intensified warfare in Mesoamerica and a time of rapid and bold imperial expansion through conquest. After the decline of Teotihuacan, the Toltecs entered the Valley of Mexico and settled in Tula. The Toltecs' legend of their origins held that in 968 C.E. their people were led into the valley by a charismatic king, Topiltzin. He assumed the name of Quetzalcoatl, the Feathered Serpent god, with whom he later became merged in Aztec mythology. In 987, amid infighting, Topiltzin-Quetzalcoatl and his followers were expelled from Tula. They marched south, where they conquered and settled in a Maya region.



Wiesner-Hanks et al., *A History of World Societies*, 11e, © 2018 Bedford/St. Martin's

The Toltecs, ca. 900–1200 C.E.

The Toltec origin myth later merged with the mythology of the Aztecs, who fashioned themselves modern Toltecs, and in turn these myths continued to evolve after the Spanish conquest in the sixteenth century to explain their defeat. Through this long and distorted course, the legend went like this: Topiltzin-Quetzalcoatl and his followers marked their journey into exile by shooting arrows into saplings, forming crosslike images. Settled in the east, he sent word that he would return to take back his rightful throne in the Mesoamerican calendar year Ce Acatl. And by tradition, the god Quetzalcoatl’s human manifestation was bearded and light skinned. Ce Acatl corresponded to the European year 1519, when Hernán Cortés marched into the Aztec capital Tenochtitlan (light skinned, bearded, and coming from the east bearing crosses). In this retelling of the myth of Quetzalcoatl among the generations that followed the conquest, the demise of the Aztec Empire at the hands of a vengeful god had been foretold by half a millennium.

The Toltecs built a military empire and gradually absorbed the culture, practices, and religion of their neighbors in the Valley of Mexico. Their empire declined amid war, drought, and famine over the eleventh and twelfth centuries. The last Toltec king died in 1174. After the demise of the Toltec Empire, city-states in the Valley of Mexico competed with each other militarily and to cast themselves as the legitimate descendants and heirs of the Toltecs.

THINKING LIKE A HISTORIAN

Feathers, Snakes, and Humans

The Feathered Serpent was one of the most significant deities of Mesoamerica. Combining multiple animal features and sometimes human features, this god may have originated with the Olmecs. A temple to the Feathered Serpent was built in Teotihuacan around 200 C.E., and versions of the deity were revered by the Maya and the Toltecs. Among the Nahua people of the Aztec Empire, a story about the human form of the god would be used to explain the arrival of Europeans in the sixteenth century. These sources represent different versions of the deity and its relationship to humanity.

1 **The Maya *Popol Vuh,* account of Quetzal Serpent's creation of the world, ca. 1554.** The *Popol Vuh* was a narrative produced in the sixteenth century that related the origins and history of Maya peoples in the Guatemalan highlands.

■ Heart of Sky arrived here with Sovereign and Quetzal Serpent [three creator gods] in the darkness, in the night…. They thought and they pondered. They reached an accord, bringing together their words and their thoughts…. Then the earth was created by them. Merely their word brought about the creation of it. In order to create the earth, they said, "Earth," and immediately it was created…. Then were conceived the animals of the mountains, the guardians of the forest, and all that populate the mountains — the deer and the birds, the puma and the jaguar, the serpent and the rattlesnake…. This, then, is the beginning of the conception of humanity, when that which would become the flesh of mankind was sought. Then spoke they who are called She Who Has Borne Children and He Who Has Begotten Sons, the Framer and the Shaper [four other gods associated with creation], Sovereign and Quetzal Serpent: "The dawn approaches, and our work is not completed. A provider and a sustainer have yet to appear — a child of light, a son of light. Humanity has yet to appear to populate the face of the earth," they said. Thus they gathered together and joined their thoughts in the darkness, in the night. They searched and they sifted. Here they thought and they pondered. Their thoughts came forth bright and clear. They discovered and established that which would become the flesh of humanity…. Thus their frame and shape were given expression by our first Mother and our first Father. Their flesh was merely yellow ears of maize and white ears of maize…. And so there were four who were made, and mere food was their flesh…. Then their companions, their wives, also came to be. It was the gods who conceived them as well.

2 **Aztec account of the creation of the fifth (and current) world, ca. 1560.** This account originates in the *Codex Chimalpopoca*, a sixteenth-century book that relates the Aztec cosmology — the origins of the world through the intervention of the gods.

■ Four worlds and their peoples had been destroyed before the making of this our

Fifth World…. Then Quetzalcoatl ventured into the domains of the Lord of the Dead to gather up the human bones of an earlier creation. Initially the bones were kept separate, the bones of the man … together on one side, and the bones of the woman … together on the other side. But in his flight from the Death Lord's anger Quetzalcoatl stumbled and dropped the bones, which shattered. He snatched up the fragments … and took them to Cihuacoatl, Woman Snake, representing Earth Lady and all her vegetable abundance, who ground them into a fine meal on her maize-grinding stone. Then it was the turn of the male gods, led by Quetzalcoatl, to make their contribution, drawing blood from their penises to moisten the ground bones. A man and a woman took form from the dough.

3 **Maya stone relief of the Vision Serpent from Yaxchilan, 726.** The Maya name for the Feathered Serpent was Kukulkan. In this panel the Vision Serpent, a deity related to Kukulkan, appears before a woman and bears ritual bloodletting implements.

Bibliothèque Nationale, Paris, France/akg-images

5 **Temple of Quetzalcoatl in Teotihuacan, ca. 200 C.E.** One of the largest pyramids in Teotihuacan was the Temple of Quetzalcoatl, whose terraces were adorned with images of the Feathered Serpent. Archaeological excavations at the pyramid have identified nearly two hundred individuals sacrificed, including two groups of eighteen, corresponding with the number of months in the Mesoamerican calendar, and one captive at each of the pyramid's four corners. The sacrifices symbolized the creation of the world.

ANALYZING THE EVIDENCE

1. In Sources 1 and 2, what similarities and differences do you find between the roles played by the Feathered Serpent in the Maya and Aztec creation myths?
2. What do Sources 1 and 2 suggest about the relationships between humans and gods in Maya and Aztec culture? Between humans and the rest of creation?
3. How do the images of the Feathered Serpent in Sources 3 and 4 combine animal and human forms? Why does the combination of a serpent and feathers suggest divinity?
4. How does an archaeological source like the temple in Teotihuacan depicted in Source 5 help us understand Quetzalcoatl?

PUTTING IT ALL TOGETHER

Using the sources above, along with what you have learned in class and in this chapter, write a short essay that examines the relationships between humans and gods in the ancient Americas. What aspects of Quetzalcoatl mythology apply to other deities of Mesoamerica or to the religious systems of the Andes?

The Aztec Empire

How did the Mexica build on the achievements of earlier Mesoamerican cultures and develop new traditions to create their large empire?

Aztec is the modern name given to the empire created by a **Nahuatl**-speaking people, the **Mexica**, who settled on Lake Texcoco in the Valley of Mexico between 1300 and 1345 (Map 11.5). They formed a vast and rapidly expanding empire ruled by the twin cities of Tenochtitlan (tay-nawch-TEET-lahn) and Tlatelolco, which by 1500 were probably larger than any city in Europe except Istanbul. This was the Aztec Empire, a network of alliances and tributary states with the Mexica at its core. Examining the means by which they formed and expanded their empire, as well as the vulnerabilities of that empire, can help us build a rich understanding of Mesoamerican society.

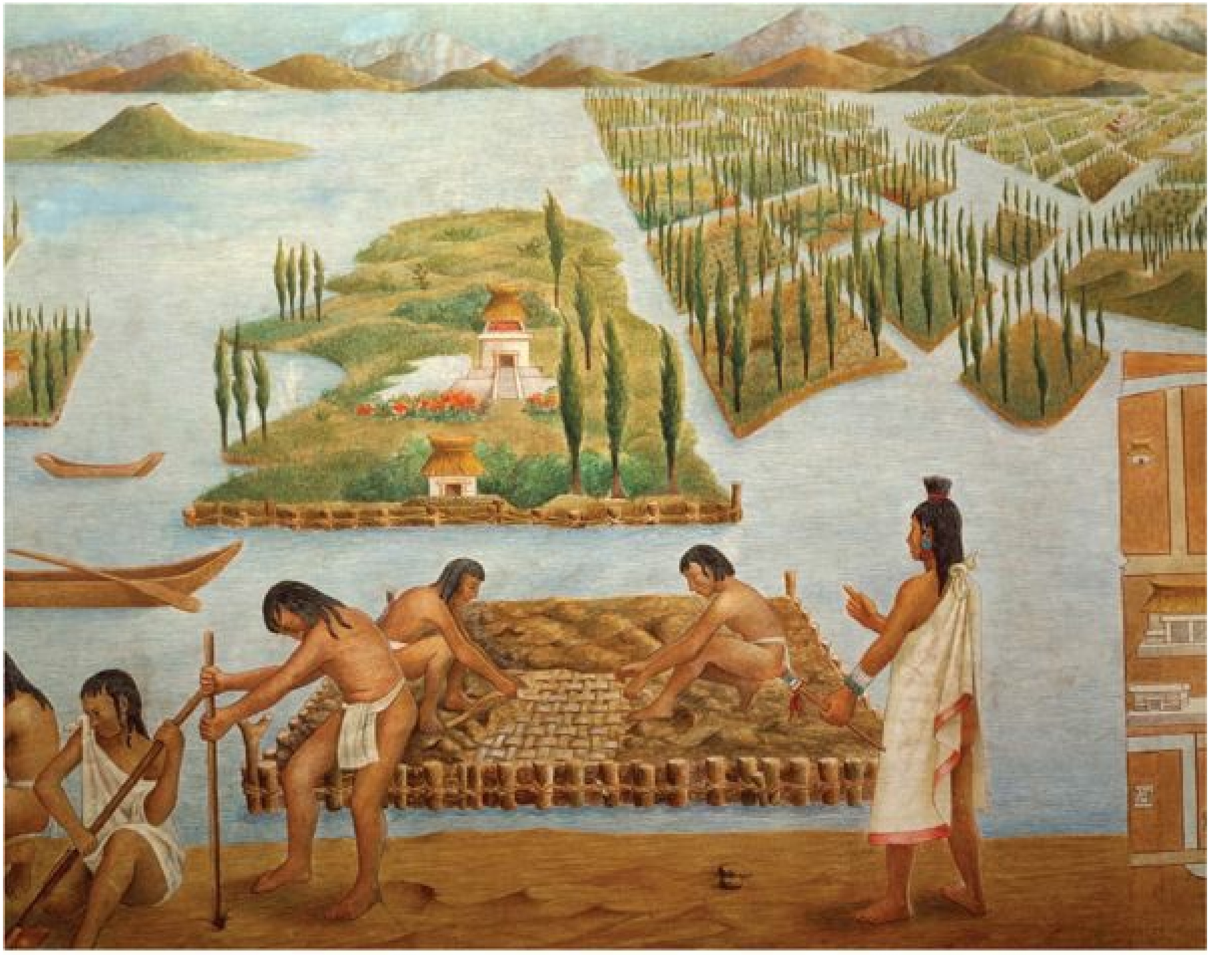
MAP 11.5 The Aztec (Mexica) Empire in 1519 The Mexica migrated into the central valley of what is now Mexico from the north, conquering other groups and establishing an empire, later called the Aztec Empire. The capital of the Aztec Empire was Tenochtitlan, built on islands in Lake Texcoco.

The Mexica: From Vassals to Masters

In the early fourteenth century the seminomadic Mexica migrated to the crowded and highly cultured Valley of Mexico. They found an environment that, since the collapse of the Toltec Empire in the twelfth century, had divided into small, fragile alliances that battled to claim the legacy of the Toltecs. At the time of their arrival, control over much of the valley lay in the hands of the Tepanec Alliance. The Mexica negotiated the right to settle on a swampy island on Lake Texcoco in exchange for military service to the Tepanecs. Here, in 1325, they founded the city of Tenochtitlan, which would become the capital of the Aztec Empire.

The Mexica adopted the customs of their new region, organizing clan-based communities called *calpolli*, incorporating the deities of their new neighbors, and serving the Tepanecs. They gradually reclaimed land around their island to form the two urban centers, Tenochtitlan and Tlatelolco. Mexica farmers adopted a technique used in parts of Lake Texcoco called *chinampa* (chee-NAHM-pah) agriculture. Under this system, farmers built up reeds and mud along the margins of Lake Texcoco to gradually extend farming well into the lake.



Museo de la Ciudad de Mexico, Mexico City/De Agostini Picture Library/Gianni Dagli Orti/Bridgeman Images

Chinampa Farming This modern illustration shows farmers in the Aztec Empire building chinampa farming plots by reclaiming land from Lake Texcoco. Farmers created the plots by packing them with vegetation and mud from the lake, supporting their boundaries by planting willow trees. Chinampas allowed for intensive farming in a region that had limited rainfall, and the canals between them permitted easy transportation.

At its peak, the chinampa farming system formed vast areas of tidy rectangular plots divided by canals that allowed for canoe transportation of people and crops. When the Spanish entered Tenochtitlan (which they called Mexico City) in November 1519, they were amazed at this city, which seemed to rise straight out of the lake.

Tenochtitlan The largest Aztec city, built starting in 1325. The Spanish admired it when they entered in 1519

Over time, the Mexica improved their standing by asking a powerful neighboring city-state to name a prince considered to be of noble Toltec descent to rule them, forming a dynasty that would become the most powerful in Mesoamerica. The new ruler, or *tlatoani* (tlah-TOH-annie), Acamapichtli (ah-cama-PITCH-lee), increased the Mexica's social rank and gave them the ability to form alliances.

By the end of Acamapichtli's reign (1372–1391), the Mexica had adapted to their new environment and had adopted the highly stratified social organization that would encourage the ambitions of their own warrior class. Under the rule of Acamapichtli's successors Huitzilihuitl (r. 1391–1417) and Chimalpopoca (r. 1417–1427), the Mexica remained subordinate to the Tepanec Alliance. But in 1427 a dispute over the succession of the Tepanec king created an opportunity for the Mexica. The Mexica formed a coalition with other cities in the Valley of Mexico, besieged the Tepanec capital for nearly three months, and then defeated it. A powerful new coalition had emerged: the Triple Alliance, with the Mexica as its most powerful partner. The Aztec Empire was born.

To consolidate the new political order, Tlatoani Itzcoatl, guided by his nephew Tlacaelel, burned his predecessors' books and drafted a new history. This history placed the warrior cult and its religious pantheon at the center of Mexica history, making the god of war, Huitzilopochtli, the patron deity of the empire. Huitzilopochtli, "Hummingbird of the South," was a god unique to the Mexica who, according to the new official origin stories of the Mexica people, had ordered them to march south until they found an island where he gave them the sign of an eagle eating a serpent, which appeared to them in Tenochtitlan. (See "Individuals in Society: Tlacaelel," page 309.)

Under the new imperial order, government offices combined military, religious, and political functions. Eventually, tlatoanis formalized these functions into distinct noble and common classes. The Valley of Mexico had sustained itself through chinampa agriculture, but as the empire grew, tribute from distant conquered peoples increasingly fed the valley's rapidly growing population. The Mexica sustained themselves through military conquest, imposing their rule over a vast part of modern Mexico.

INDIVIDUALS IN SOCIETY

Tlacaelel

Tlacaelel emphasized human sacrifice as one of the Aztecs' religious duties.

THE HUMMINGBIRD GOD HUITZILOPOCHTLI WAS ORIGI-nally a somewhat ordinary god of war and of young men, but in the fifteenth century he was elevated in status among the Mexica. He became increasingly associated with the sun and gradually became the most important Mexica deity. This change appears to have been primarily the work of Tlacaelel, the very long-lived chief adviser to the emperors Itzcoatl (r. 1427–1440), Moctezuma I (r. 1440–1469), and Axayacatl (r. 1469–1481). Tlacaelel first gained influence during wars in the 1420s in which the Mexica defeated the rival Tepanecs, after which he established new systems of dividing military spoils and enemy lands. At the same time, he advised the emperor that new histories were needed in which the destiny of the Mexica people was made clearer. Tlacaelel ordered the destruction of older historical texts, and under his direction the new chronicles connected Mexica fate directly to Huitzilopochtli. Mexica writing was primarily pictographic, drawn and then read by specially trained scribes who used written records as an aid to oral presentation, especially for legal issues, historical chronicles, religious and devotional poetry, and astronomical calculations.

According to these new texts, the Mexica had been guided to Lake Texcoco by Huitzilopochtli; there they saw an eagle perched on a cactus, which a prophecy foretold would mark the site of their new city.

Huitzilopochtli kept the world alive by bringing the sun’s warmth, but to do this he required the Mexica, who increasingly saw themselves as the “people of the sun,” to provide a steady offering of human blood.

The worship of Huitzilopochtli became linked to cosmic forces as well as daily survival. In Nahua tradition, the universe was understood to exist in a series of five suns, or five cosmic ages. Four ages had already passed, and their suns had been destroyed; the fifth sun, the age in which the Mexica were now living, would also be destroyed unless the Mexica fortified the sun with the energy found in blood. Warfare thus brought new territory under Mexica control and provided sacrificial victims to nourish the sun-god. With these ideas, Tlacaelel created what Miguel León-Portilla, a leading contemporary scholar of Nahua religion and philosophy, has termed a “mystico-militaristic” conception of Aztec destiny.

Human sacrifice was practiced in many cultures of Mesoamerica, including the Olmec and the Maya as well as the Mexica, before the changes introduced by Tlacaelel, but historians believe the number of victims increased dramatically during the last period of Mexica rule. A huge pyramid-shaped temple in the center of Tenochtitlan, dedicated to Huitzilopochtli and Tlaloc, the god of rain, was renovated and expanded many times, the last in 1487. To dedicate each expansion, priests sacrificed war captives. Similar ceremonies were held regularly throughout the year on days dedicated to Huitzilopochtli and were attended by many observers, including representatives from neighboring states as well as masses of Mexica. According to many accounts, victims were placed on a stone slab, and their hearts were cut out with an obsidian knife; the officiating priest then held the heart up as an offering to the sun. Sacrifices were also made to other gods at temples elsewhere in Tenochtitlan, and perhaps in other cities controlled by the Mexica.

Estimates of the number of people sacrificed to Huitzilopochtli and other Mexica gods vary enormously and are impossible to verify. Both Mexica and later Spanish accounts clearly exaggerated the numbers, but most historians today assume that between several hundred and several thousand people were killed each year.

QUESTIONS FOR ANALYSIS

1. How did the worship of Huitzilopochtli contribute to Aztec expansion? To hostility toward the Aztecs?
2. Why might Tlacaelel have believed it was important to destroy older texts as he created this new Aztec mythology?

Life in the Aztec Empire

Few social distinctions existed among the Aztecs during their early migrations, but by the early sixteenth century Aztec society changed as the warrior aristocracy asserted great authority. Men who had distinguished themselves in war occupied the highest military and social positions in the state. Generals, judges, and governors of provinces were appointed by the emperor from among his servants who had earned reputations as war heroes. These great lords, or *tecuhtli* (teh-COOT-lee), dressed luxuriously and lived in palaces.

Beneath the aristocracy of military leaders and imperial officials was the class of warriors. Theoretically, every free man could be a warrior, and parents dedicated their male children to war, burying a male child's umbilical cord with arrows and a shield on the day of his birth. In practice, the sons of nobles were more likely to become warriors because of their fathers' positions and influence in the state. At the age of six, boys entered a school that trained them for war. They were taught to fight with a *macana*, a paddle-shaped wooden club edged with bits of obsidian, and learned to live on little food and sleep and to accept pain without complaint. When a man reached adulthood, he fought his first campaign. If he captured a prisoner for ritual sacrifice, he acquired the title *iyac*, or warrior. If he continued to succeed in later campaigns, he became a *tequiua* — one who shared in the booty and was thus a member of the nobility. If a young man failed in several campaigns to capture the required four prisoners, he became a *macehualli* (plural *macehualtin*), a commoner.

The macehualtin were the ordinary citizens — the backbone of Aztec society and the vast majority of the population. The word *macehualli* means "worker" and implies boorish speech and vulgar behavior. Macehualtin performed agricultural, military, and domestic services and carried heavy burdens not required of noble warriors. They were assigned to work on the temples, roads, and bridges. Unlike nobles, priests, orphans, and slaves, macehualtin paid taxes. Macehualtin in the capital, however, possessed certain rights: they held their plots of land for life, and they received a share of the tribute paid by the provinces to the emperor.

Beneath the macehualtin were the *tlalmaitl*, the landless workers or serfs who provided agricultural labor, paid rents, and were bound to the soil — they could not move off the land. In many ways the tlalmaitl resembled European serfs, but unlike serfs they performed military service when called. Slaves were the lowest social class. Most were prisoners captured in war or kidnapped from enemy tribes. People convicted of crimes could be sentenced to slavery, and people in serious debt sometimes sold themselves. Female slaves often became their masters' concubines. Mexica slaves could save money, buy property or slaves of their own, and purchase their freedom. If a male slave married a free woman, their offspring were free. Most slaves eventually gained their freedom.

Women of all social classes operated within the domestic sphere. As the little hands of the newborn male were closed around a tiny bow and arrow indicating his warrior destiny, so the infant female's hands were wrapped around miniature weaving instruments and a small broom: weaving was a sacred and exclusively female art, and the broom signaled a female's responsibility for the household shrines and for keeping the home swept and free of contamination. Save for the few women vowed to the service of the temple, marriage and the household were a woman's fate, and marriage represented social maturity for both sexes. Pregnancy became the occasion for family and neighborhood feasts, and a successful birth launched celebrations lasting from ten to twenty days.

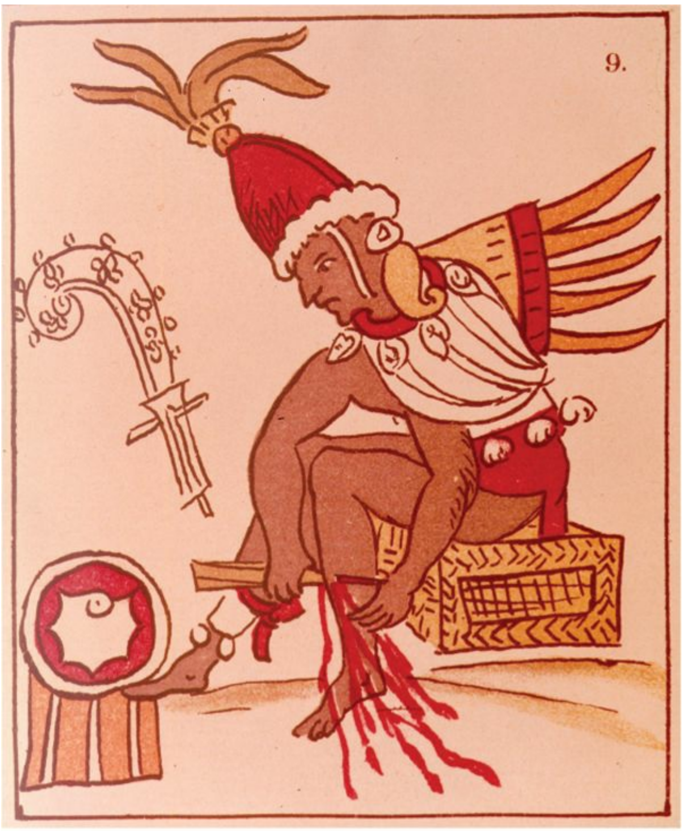
The Limits of the Aztec Empire

Mesoamerican empires like that of the Aztecs were not like modern nation-states that consolidate control of the territory within their borders. Instead the Aztec Empire was a syndicate in which the Mexica, their allies, and their subordinates thrived on trade and tribute backed by the threat of force.

When a city succumbed, its captive warriors were marched to Tenochtitlan to be sacrificed. The defeated city was obligated to provide tribute including corn, flowers, feathers, gold, and hides. But conquest stopped short of assimilation. Rulers and nobles remained in place. Subjects were not required to adopt Mexica gods, and local communities and their leaders remained intact.

The death of a ruler is always a time of uncertainty, and this was especially true in Mesoamerica under the Aztec Empire. For peoples of the Valley of Mexico and beyond, this meant war was sure to arrive. The council of high nobles who served the deceased ruler chose the new tlatoani, who was often the commander of the army. Once the new tlatoani was named, he would embark on a military campaign in order to answer the questions his succession raised: Would he bring sacrificial victims to the gods and thus ensure prosperity and fertility during his reign? Could he preserve and strengthen the alliances that composed the empire? Could he keep rivals at bay?

A success in the tlatoani's inaugural military campaign provided new tribute-paying subjects, produced a long train of sacrificial victims captured in battle, maintained the stability of the empire's alliances, warned off potential foes, and kept conquered areas in subordination. After the successful campaign, the new tlatoani invited the rulers of allied, subject, and enemy city-states alike to his coronation ceremony — a pageant of gifts, feasts, and bloody sacrifice that proclaimed Tenochtitlan's might.



akg-images

Quetzalcoatl Bleeding Himself to Create Man
This image reflects Quetzalcoatl in his human form, carrying out the sacrifice that created humanity. The combination of spiritual and human forms allowed rulers such as Topiltzin to also claim identities as gods.

But success was not always possible, as the troubled rule of Tizoc (r. 1481–1486) demonstrated. After a series of wars that produced few sacrifices, he was poisoned by his own subjects. His successor, Ahuitzotl (r. 1486–1502), faced the challenge of reinvigorating the empire through renewed displays of strength. To symbolize the restoration of Tenochtitlan's power, he waged wars of conquest that exceeded anything ever seen, culminating in two coronation ceremonies, the second of which involved sacrificing over eighty thousand captive warriors.

Blood sacrifice was not new to the Aztecs. For centuries Mesoamerican peoples had honored their gods this way, but the Aztecs elevated the warrior cult as their central observance. They believed the earth had been destroyed and re-created four times. The end of creation loomed after their age, the fifth sun. Since the apocalypse might be forestalled through divine intervention, their sacrifice could show that humans were worthy of divine intervention. If ancient deities had given their lives to save the sun, how could mortals refuse to do the same?

The ceremony observing the end of each fifty-two-year bundle reflected the worldview of the Mexica. Had humans sacrificed enough for the gods to intercede and ensure the sun would rise again? In preparation for the end, families broke their earthenware vessels, cleansed their homes, and extinguished all fires. Upon the new dawn, priests made a fire on the chest of a living, powerful captive warrior. Noble warriors lit torches from this new fire and relayed the flame of creation into each hearth in the empire. For the next fifty-two years, all would know the fire in their hearth, like the rising of the sun itself, was the fruit of a sacred warrior sacrifice.

The need for sacrifice, as well as the glorification of the warriors who provided it through battle, was a powerful rationale for the expansion of the Aztec Empire. The role of the Aztecs’ sacrifice-based religious system is the subject of scholarly debate: Did the religious system guide imperial expansion? Or did imperial expansion guide the religious system? These views are by no means incompatible: for the Aztecs, the peoples who came under their rule, and the peoples who resisted them, the twin goals of empire building and service to the gods were inseparable.

American Empires and the Encounter

What did the European encounter mean for peoples of the major American empires?

By 1500 the Incas and Aztecs strained under the burdens of managing the largest empires the Americas had seen. Both faced the challenges of consolidating their gains, bearing the costs of empire and of the swelling nobility, and waging war in increasingly distant and difficult conditions.

The Last Day of the Aztecs

In 1502 the last Mexica to rule before the arrival of the Spaniards, Moctezuma II, was named tlatoani. Moctezuma inherited a strained empire. His predecessors had expanded the empire's reach from the Caribbean coast to the Pacific. At the margins of the empire the Aztecs encountered peoples who were seminomadic or who, like the Maya, had abandoned their cities to resist conquest. An empire that had expanded rapidly through conquest found itself with little room to grow.

Aztec leaders had sought targets for conquest that were easy to overpower or that produced goods that made for valuable tribute. This created an empire riddled with independent enclaves that had resisted conquest. The most powerful of these was Tlaxcala (tlah-SKAH-lah), at the edge of the Valley of Mexico. In addition, even areas under Aztec rule retained local leadership and saw themselves as subjected peoples, not as Aztecs.

Finally, the costs of empire had become onerous. Generations of social mobility through distinction in war had produced a bloated nobility both exempt from and sustained by tribute. Tenochtitlan became dependent on tributary maize in order to feed itself. The lack of new peoples to conquer meant the empire had little promise of increased prosperity. The dwindling flow of sacrificial victims meant the Mexica might be losing the great cosmic struggle to keep creation from ending.

Faced with these challenges, Moctezuma II introduced reforms, reducing the privileges (and thus the costs to the empire) of the lesser nobility and narrowing the pathways of social mobility. However, the austerity he imposed caused unrest. He also attempted to conquer the autonomous enclaves left by his predecessors. As Moctezuma targeted these enclaves, their ability to resist sapped their resources and strained their morale without producing a corresponding reward for the empire in sacrifice or tribute.

By the time he reached the gates of Tenochtitlan in 1519, the Spanish conquistador Hernán Cortés had forged alliances with foes of the Aztecs, particularly Tlaxcala, which had so ably resisted conquest. The Tlaxcalans saw in the foreigners an opportunity to fight the Mexica. Cortés's band of six hundred Spaniards arrived in Tenochtitlan accompanied by tens of thousands of Tlaxcalan soldiers. In Tlaxcala the defeat of Tenochtitlan would be seen as the Tlaxcalans' victory, not that of the handful of Spaniards.

Whatever Moctezuma made of the strangers, he received them as guests while he sought to understand the nature of this encounter and its significance for his empire. Perhaps he hesitated, losing the opportunity to act against them. Perhaps he concluded that he had no chance of defeating them, since at that moment most of the men he could count on in battle were tending to their crops and the capital had been so riddled with resentment of his reforms that he was powerless to act.

Either way, Cortés and his men managed the encounter skillfully and succeeded in taking Moctezuma prisoner. When the residents of Tenochtitlan rose up to expel the Spaniards, Moctezuma was killed. Though the Spaniards were expelled from the city, they left an unwelcome guest, smallpox. The first epidemic of the disease swept through the city in 1520, killing Moctezuma's successor within a matter of months. Cuauhtemoc, the last tlatoani of the Mexica, was named that same year.

Past and Present Meet in Mexico City Construction for the Pino Suárez metro station unearthed the Aztec ceremonial altar of Ehecatl, the Aztec god of wind.

The Aztec Empire and the Mexica people were not defeated by technology, cultural superiority, or a belief that the Europeans were gods. Instead they suffered a political defeat: their fall was owed more than anything to the willingness of allies and enemies alike to join with the Spaniards against them when they perceived an opportunity.

Through the lens of history, the destruction of the Aztec Empire seems swift, but Tenochtitlan resisted for two years. During this time the Spaniards and Tlaxcalans brokered alliances leaving the Mexica virtually alone in their fight. In this sense, the end of the Aztec Empire looked a lot like its beginning: people who had obeyed the Mexica now took advantage of the opportunity to defeat them, just as the Mexica had done with the Tepanec Alliance. Even so, abandoned by their allies, the besieged Mexica fought on through famine and disease, defending their city street by street until Cuauhtemoc surrendered to Cortés on August 13, 1521.

The Fall of the Incas

In 1525 Huayna Capac Inca, the grandson of Pachacuti Inca, became ill while carrying out a military campaign in present-day Ecuador, at the northern frontier of the empire. His illness was likely smallpox, introduced by Europeans waging wars of conquest in Mesoamerica, and it would kill him. But as he waged war, he also received news of the foreigners — Spaniards — in the north and anticipated that they would come southward.

Huayna Capac's death unleashed civil war between two of his sons over succession to the throne. Huascar claimed it as the firstborn. Atahualpa (ah-tuh-WAHL-puh), Huayna Capac's favorite and an experienced commander who had accompanied him in his Ecuadorean campaign, claimed it as well. Atahualpa asserted that Huayna Capac's dying wish was that Atahualpa succeed him. The brothers fought until 1532, when Atahualpa vanquished and imprisoned Huascar and consolidated his rule in Cuzco. That same year a group of Spaniards led by Francisco Pizarro landed on the Peruvian coast, pursuing rumors of a city of gold in the mountains.

Atahualpa agreed through emissaries to meet the Spaniards at the city of Cajamarca in northern Peru. In a demonstration of his imperial authority, he entered Cajamarca carried on a golden litter, accompanied by four military squadrons totaling twenty-four thousand soldiers. Members of the nobility followed, carried on their own litters. Their procession was preceded by a multitude of servants who cleared the ground, removing all stones, pebbles, and even bits of straw. Atahualpa met the Spanish intending to understand them and hear them out. However, the meeting between Atahualpa and Pizarro reflected deeply different worldviews. (See “Global Viewpoints: Inca and Spanish Views on Religion, Authority, and Tribute,” above.)

Though Atahualpa had not planned to fight, Pizarro planned an ambush, using the city walls to trap Atahualpa’s soldiers and kill a large number of them. The Spaniards took Atahualpa prisoner and eventually executed him. The Spaniards named a new indigenous leader, Manco Capac, whom they hoped to control. But Manco Capac turned against the Spaniards. He, and later his son Tupac Amaru, led resistance against the Spaniards until 1567. Each time the Inca forces besieged a Spanish-controlled city or town, however, their proximity to the Spaniards exposed them to European diseases. They were more successful in smaller-scale attacks, which delayed and limited Spanish colonization, but did not undo it.

GLOBAL VIEWPOINTS

Inca and Spanish Views on Religion, Authority, and Tribute

In 1532 Atahualpa Inca met with a band of Spaniards led by Francisco Pizarro, who ambushed him and took him prisoner. At the beginning of their meeting, a priest accompanying Pizarro read to Atahualpa, through a translator, a document prepared in Spain in 1513 called the *Requerimiento*. The document presented Roman Christianity and the Spaniards' religious right to conquest. Conquistadors were obligated to read the *Requerimiento* in front of witnesses before waging a war of conquest. Spanish colonial sources and the 1609 account by chronicler Garcilaso de la Vega, son of an Andean woman and a Spanish soldier, describe the remarkable exchange.

Friar Vicente de Valverde Presents the *Requerimiento*

■ It is proper that you should know, most famous and most powerful king, that it is necessary that Your Highness and all your subjects should not only learn the true Catholic faith but that you should hear and believe the following….

Therefore the holy pope of Rome … has conceded the conquest of these parts to Charles V, … the most powerful king of Spain and monarch of all the earth…. The great emperor Charles V has chosen as his lieutenant and ambassador Don Francisco Pizarro, who is now here, … so that Your Highness and all your realms will become tributaries; that is to say, you will pay tribute to the emperor, and will become his vassal and deliver your kingdom wholly into his hands, renouncing the administration of it, as other kings and lords have done…. If you seek obstinately to resist, you may rest assured that God will suffer that you and all your Indians shall be destroyed by our arms.

The Inca Atahualpa Responds

■ I will be no man's tributary. I am greater than any prince upon the earth. Your emperor may be a great prince … and I am willing to hold him as a brother. As for the pope of whom you speak, he must be crazy to talk of giving away countries that do not belong to him. For my faith, I will not change it. Your own God, as you say, was put to death by the very men he created. But mine … [pointing to the sun] still lives in the heavens, and looks down upon his children….

You threaten us with war and death … and say that I must renounce my kingdom and become the tributary of another, either willingly or by force. Whence I deduce one of two things: either your prince and you are tyrants who are destroying the world, depriving others of their realms, slaying and robbing those who have done you no harm and owe you nothing, or you are ministers of God, whom we call Pachacámac, who has chosen you to punish and destroy us….

You have mentioned five great men I should know. The first is God … : he is perchance the same as our Pachacámac and Viracocha. The second is he whom you say is the father of all other men on whom they have all heaped their sins. The third you call Jesus Christ …, but he was killed. The fourth you call pope. The fifth is Charles…. If this Charles is prince and lord of the whole world, why should he need the pope to give him a new grant and concession to make war on me and usurp these kingdoms? If he has to ask the pope's permission, is not the pope a greater lord than he, and more powerful, and prince of all the world? Also, I am surprised that you say that I must pay tribute to Charles and not to the others, for you give no reason for paying the tribute, and I have certainly no obligation whatever to pay it.

QUESTIONS FOR ANALYSIS

1. According to Atahualpa, what is the source of his authority? According to him, what is the source of the Spaniards' authority?
2. Why does Atahualpa believe that the Spaniards have more gods than the Incas do?
3. How does Atahualpa perceive the Spaniards and their intentions?

Chapter Summary

The civilizations of the Andes and Mesoamerica from which the Incas and Aztecs emerged had remarkable similarities with, and differences from, other ancient and premodern civilizations in other regions of the world. Indigenous societies of the Americas developed extensive networks of trade. In Mesoamerica and the Andes, the domestication of crops led to the kind of bountiful production that allowed for diversification of labor among farmers, priests, nobles, merchants, and artisans. In these environments, cycles of centralization occurred in which powerful city-states emerged and embarked on campaigns of conquest, bringing vast regions under their political, religious, and cultural influence.

But civilizations of the Americas developed in unique ways as well. This was particularly true in the Andes, where peoples developed specialized patterns of farming in vertical archipelagos in their inhospitable mountain environment. Similarly, though Andean peoples did not develop writing, they instead developed the khipu into a sophisticated system of recording and communicating information.

Ultimately, the history of the peoples of the Americas was defined by their diverse experiences as they coped with varied climates, ecology, and geography. And peoples' experiences of adapting to their environments, and of transforming those environments to meet their needs, shaped the ways they understood their world. These experiences led them to produce precise calendars, highly detailed readings of the stars, and an elaborate architecture of religious beliefs through which they interpreted their relationships to their world and their place in the cosmos.

CONNECTIONS

The early sixteenth century marked the end of independent empires of the Americas and the gradual integration of American peoples into global empires seated in Europe. Spaniards were the most motivated and had their greatest success when they encountered dense, organized urban areas. Here they displaced existing overlords as the recipients of tribute in goods and labor. The Spanish were less interested in sparsely settled areas that did not have well-established systems of trade and tribute and were harder to subdue. As a result, European conquest was a surprisingly drawn-out process. Peoples of the Americas resisted conquest until well into the nineteenth century.

The incidental companion of conquest — disease — was also uneven in its effects. Over the course of the sixteenth century, epidemics shrank the population of the Americas from 50 million to just 5 million. But epidemic diseases spread through human contact, such as measles and smallpox, are primarily urban phenomena: these diseases emerged as ancient cities grew large enough that the diseases could spread quickly among dense populations. As a result, the impact of the diseases brought by Europeans was the most severe and the most destructive in the cities of the Americas.

Since cities faced the brunt of both disease and wars of conquest, the disruptions caused by the encounter were disproportionally felt there. Whole systems of knowledge, sets of artisanal skills, political cultures, and religious thought resided in cities. Thus, as epidemics erupted, many of the most remarkable aspects of American civilizations were lost. Rural peoples and cultures were much more resilient. It was in rural areas that languages, foodways, farming practices, and approaches to healing — indeed whole worldviews — endured and evolved. By contrast, Spanish colonial towns and cities were protected from indigenous attacks because they bore diseases that could afflict their attackers. The Americas were rapidly integrated with the rest of the world in the sixteenth century, but the combination of conquest, colonization, and disease ensured the unevenness of this exchange.

Mongol Woman

Women played influential roles among the

Mongols. The Mongol woman portrayed in this painting is Chabi, wife of Khubilai Khan. Like other Mongols, she maintained Mongol dress even though she spent much of her time in China.

The large expanse of Asia treated in this chapter underwent profound changes during the centuries examined here. The north saw the rise of nomadic pastoral societies, first the Turks, then more spectacularly the Mongols. The nomads' mastery of the horse and mounted warfare gave them a military advantage that agricultural societies could rarely match. From the fifth century on, groups of Turks appeared along the fringes of the settled societies of Eurasia, from China and Korea to India and Persia. Often Turks were recruited as auxiliary soldiers; sometimes they gained the upper hand. By the tenth century many were converting to Islam (see "The Ascendancy of the Turks" in Chapter 9).

Much more dramatic was the rise of the Mongols under the charismatic leadership of Chinggis Khan in the late twelfth and early thirteenth centuries. A military genius with a relatively small army, Chinggis subdued one society after another from Byzantium to the Pacific. For a century Mongol hegemony fostered unprecedented East-West trade and contact. More Europeans made their way east than ever before, and Chinese inventions such as printing and the compass made their way west.

Over the course of several centuries, Arab and Turkish armies brought Islam to India, but the Mongols never gained power there. In the Indian subcontinent during these centuries, regional cultures flourished. Although Buddhism declined, Hinduism continued to flourish. India continued to be the center of a very active seaborne trade, and this trade helped carry Indian ideas and practices to Southeast Asia. Buddhism was adopted in much of Southeast Asia, along with other ideas and techniques from India. The maritime trade in spices and other goods brought increased contact with the outside world to all but the most isolated of islands in the Pacific.

Central Asian Nomads

What aspects of nomadic life gave the nomads of Central Asia military advantages over nearby settled civilizations?

One experience Rome, Persia, India, and China all shared was conflict with **nomads** who came from the very broad region referred to as Central Asia. This region was dominated by the **steppe**, arid grasslands that stretched from modern Hungary to Mongolia and parts of present northeast China. Initially small in number, the nomadic peoples of this region used their military superiority to conquer first other nomads, then the nearby settled societies. In the process they created settled empires of their own that drew on the cultures they absorbed.

nomads Groups of people who move from place to place in search of food, water, and pasture for their animals, usually following the seasons.

steppe Grasslands that are too dry for crops but support pasturing animals; they are common across much of the center of Eurasia.

Nomadic Society

Easily crossed by horses but too dry for crop agriculture, the grasslands could support only a thin population of nomadic herders who lived off their sheep, goats, camels, horses, or other animals. Following the seasons, they would break camp at least twice a year and move their animals to new pastures, going north in the spring and south in the fall.

In their search for water and good pastures, nomadic groups often came into conflict with other nomadic groups pursuing the same resources, which the two would then fight over. Groups on the losing end, especially if they were small, faced the threat of extermination or slavery, which prompted them to make alliances with other groups or move far away. Groups on the winning end of intertribal conflicts could exact tribute from those they defeated.

To get the products of nearby agricultural societies, especially grain, woven textiles, iron, tea, and wood, nomadic herders would trade their own products, such as horses and furs. When trade was difficult, they would turn to raiding to seize what they needed. Much of the time nomadic herders raided other nomads, but nearby agricultural settlements were common targets as well. The nomads’ skill as horsemen and archers made it difficult for farmers and townsmen to defend against them.

Political organization among nomadic herders was generally very simple. Clans — members of an extended family — had chiefs, as did tribes (coalitions of clans). Leadership within a group was based on military prowess and was often settled by fighting. Occasionally a charismatic leader would emerge who was able to extend alliances to form confederations of tribes. From the point of view of the settled societies, which have left most of the records about these nomadic groups, large confederations were much more of a threat, since they could plan coordinated attacks on cities and towns. Large confederations rarely lasted more than a century or so, however, and when they broke up, tribes again spent much of their time fighting with each other.

The three most wide-ranging and successful confederations were those of the Xiongnu — Huns, as they were known in the West — who emerged in the third century B.C.E. in the area near China; the Turks, who had their origins in the same area in the fourth and fifth centuries C.E.; and the Mongols, who did not become important until the late twelfth century. In all three cases, the entire steppe region was eventually swept up in the movement of peoples and armies.

The Turks

The Turks were the first of the Inner Asian peoples to have left a written record in their own language; the earliest Turkish documents date from the eighth century. Turkic languages today are spoken by the Uighurs in western China; the Uzbeks, Kazakhs, Kyrghiz (KIHR-guhz), and Turkmens of Central Asia; and the Turks of modern Turkey.

In 552 a group called Turks who specialized in metalworking rebelled against their overlords, the Rouruan, whose empire dominated the region from the eastern Silk Road cities of Central Asia through Mongolia. The Turks quickly supplanted the Rouruan as overlords of the Silk Road in the east. When the first Turkish khagan (ruler) died a few years later, the Turkish empire was divided between his younger brother, who took the western part (modern Central Asia), and his son, who took the eastern part (modern Mongolia). In 576 the Western Turks captured the Byzantine city of Bosporus in the Crimea.

The Eastern Turks frequently raided China and just as often fought among themselves. A seventh-century Chinese history records that “the Turks prefer to destroy each other rather than to live side-by-side. They have a thousand, nay ten thousand clans who are hostile to and kill one another. They mourn their dead with much grief and swear vengeance.”[1]

In the early seventh century the empire of the Eastern Turks ran up against the growing military might of the Tang Dynasty in China and soon broke apart.

In the eighth century a Turkic people called the Uighurs (WEE-gurs) formed a new empire based in Mongolia that survived about a century. During this period many Uighurs adopted religions then current along the Silk Road, notably Buddhism, Nestorian Christianity, and Manichaeism. In the ninth century this Uighur empire collapsed, but some Uighurs fled west, setting up their capital city in Kucha, where they created a remarkably stable and prosperous kingdom that lasted four centuries (ca. 850–1250).

Farther west in Central Asia other groups of Turks rose to prominence. Often local Muslim forces would try to capture them, employ them as slave soldiers, and convert them. By the mid- to late tenth century many were serving in the armies of the Abbasid caliphate. Also in the tenth century Central Asian Turks began converting to Islam (which protected them from being abducted as slaves). Then they took to raiding unconverted Turks.

In the mid-eleventh century Turks had gained the upper hand in the caliphate, and the caliphs became little more than figureheads. From there Turkish power was extended into Syria, Palestine, and Asia Minor. In 1071 Seljuk (SEHL-jook) Turks inflicted a devastating defeat on the Byzantine army in eastern Anatolia.

In India, Persia, and Anatolia the formidable military skills of nomadic Turkish warriors made it possible for them to become overlords of settled societies. Often Persian was used as the administrative language of the states they formed. Nevertheless, despite the presence of Turkish overlords all along the southern fringe of the steppe, no one group of Turks was able to unite them all into a single political unit. That feat had to wait for the next major power on the steppe, the Mongols.

The Mongols

In the twelfth century ambitious Mongols did not aspire to match the Turks or other groups that had migrated west, but rather wanted to be successors to the Khitans and Jurchens, nomadic groups that had stayed in the east and mastered ways to extract resources from China. The Khitans and Jurchens had formed hybrid nomadic-urban states, with northern sections where tribesmen continued to live in the traditional way and southern sections politically controlled by the non-Chinese rulers but settled largely by taxpaying Chinese. The Khitans and Jurchens had scripts created to record their languages and adopted many Chinese governing practices. They built cities in pastoral areas that served as trading centers and places to enjoy their newly acquired wealth. In both the Khitan and Jurchen cases, their elite became culturally dual, adept in Chinese ways as well as in their own traditions.

The Mongols lived north of these hybrid nomadic-settled societies and maintained their traditional ways. They lived in tents called **yurts** rather than in houses. The yurts, about twelve to fifteen feet in diameter, were constructed of light wooden frames covered by layers of wool felt, greased to make them waterproof. The floor of a yurt was covered first with dried grass or straw, then with felt, skins, or rugs. In the center, directly under the smoke hole, was the hearth. Goat horns attached to the frame of the yurt were used as hooks to hang joints of meat, cooking utensils, bows, quivers of arrows, and the like. A group of families traveling together would set up their yurts in a circle open to the south and draw up their wagons in a circle around the yurts for protection.

yurts Tents in which the pastoral nomads lived; they could be quickly dismantled and loaded onto animals or carts.

The Mongol diet consisted mostly of animal products. The most common meat was mutton, supplemented with wild game. When grain or vegetables could be obtained through trade, they were added to the diet. The Mongols milked sheep, goats, cows, and horses and made cheese and fermented alcoholic drinks from the milk.

Because of the intense cold of the winter, the Mongols made much use of furs and skins for clothing. Hats were of felt or fur, boots of felt or leather. Men wore leather belts to which their bows and quivers could be attached. Women of high rank wore elaborate headdresses decorated with feathers.

Mongol women had to work very hard and had to be able to care for the animals when the men were away hunting or fighting. They normally drove the carts and set up and dismantled the yurts. They also milked the sheep, goats, and cows and made the butter and cheese. Because water was scarce, clothes were not washed with water, nor were dishes. Women, like men, had to be expert riders, and many also learned to shoot. They participated actively in family decisions, especially as wives and mothers. In *The Secret History of the Mongols*, the mother and wife of the Mongol leader Chinggis Khan frequently make impassioned speeches on the importance of family loyalty. (See “Analyzing the Evidence: The Abduction of Women in *The Secret History of the Mongols*,” page 324.)

Gold Belt Plaques Like earlier nomads, the Mongols favored art with animal designs, such as these two gold belt plaques, which depict deer under trees or flowers. Belts and horses were often exchanged to seal or commemorate an alliance.

Mongol men kept as busy as the women. They made the carts and wagons and the frames for the yurts. They also made harnesses for the horses and oxen, leather saddles, and the equipment needed for hunting and war, such as bows and arrows. Men also had charge of the horses, and they milked the mares. One specialist among the nomads was the blacksmith, who made stirrups, knives, and other metal tools.

Kinship underlay most social relationships among the Mongols. Normally each family occupied a yurt, and groups of families camping together were usually related along the male line. More distant patrilineal relatives were recognized as members of the same clan and could call on each other for aid. People from the same clan could not marry each other, so men had to get wives from other clans. When a woman’s husband died, she would be inherited by another male in the family, such as her husband’s brother. Tribes were groups of clans, often distantly related. Both clans and tribes had chiefs who would make decisions on where to graze and when to retaliate against another tribe that had stolen animals or people. Women were sometimes abducted for brides. When tribes stole men from each other, they normally made them into slaves, and slaves were forced to do much of the heavy work.

Even though population was sparse in the regions where the Mongols lived, conflict over resources was endemic, and each camp had to be on the alert for attacks. Defending against attacks and retaliating against raids was as much a part of the Mongols’ daily life as caring for their herds and trading with nearby settlements.

Mongol children learned to ride at a young age. The Mongols’ horses were small but nimble and able to endure long journeys and bitter cold. The prime weapon boys had to learn to use was the compound bow, which had a pull of about 160 pounds and a range of more than 200 yards; it was well suited for using on horseback, giving Mongol soldiers an advantage in battle. Other commonly used weapons were small battle-axes and lances fitted with hooks to pull enemies off their saddles.

As with the Turks and other steppe nomads, religious practices centered around the shaman, a religious expert believed to be able to communicate with the gods. The high god of the Mongols was Heaven/Sky, but they recognized many other gods as well. Some groups of Mongols, especially those closer to settled communities, converted to Buddhism, Nestorian Christianity, or Manichaeism (man-uh-KEY-an-ism).

ANALYZING THE EVIDENCE

The Abduction of Women in *The Secret History of the Mongols*

Within a few decades of Chinggis Khan’s death, oral traditions concerning his rise were written down in the Mongolian language in *The Secret History of the Mongols*. The account begins with the cycles of revenge among the tribes in Mongolia, many of which began when women were abducted for wives. The following passages relate how Temujin’s (Chinggis Khan’s) father, Yesugei, seized Hogelun, Temujin’s future mother, from a passing Merkid tribesman; how twenty years later three Merkids in return seized women from Temujin; and how Temujin got revenge.

That year Yesugei the Brave was out hunting with his falcon on the Onan. Yeke Chiledu, a nobleman of the Merkid tribe, had gone to the Olkhunugud people to find himself a wife, and he was returning to the Merkid with the girl he’d found when he passed Yesugei hunting by the river. When he saw them riding along Yesugei leaned forward on his horse. He saw it was a beautiful girl. Quickly he rode back to his tent and just as quick returned with his two brothers, Nekun Taisi and Daritai Odchigin. When Chiledu saw the three Mongols coming he … cut back around the far side of the hill and rode to Lady Hogelun, the girl he’d just married, who stood waiting for him at the front of their cart. “Did you see the look on the faces of those three men?” she asked him. “From their faces it looks like they mean to kill you. As long as you’ve got your life there’ll always be girls for you to choose from. There’ll always be women to ride in your cart. As long as you’ve got your life you’ll be able to find some girl to marry. When you find her, just name her Hogelun for me, but go now and save your own life!” Then she pulled off her shirt and held it out to him, saying: “And take this to remember me, to remember my scent.” …

The three Mongols chased him across seven hills before turning around and returning to Hogelun’s cart.… As they rode her back toward their camp, Hogelun began to cry, … and she cried till she stirred up the waters of the Onan River, till she shook the trees in the forest and the grass in the valleys. But as the party approached their camp Daritai, riding beside her, warned her to stop: “This fellow who held you in his arms, he’s already ridden over the mountains. This man who’s lost you, he’s crossed many rivers by now. You can call out his name, but he can’t see you now even if he looks back. If you tried to find him now you won’t even find his tracks. So be still now,” he told her. Then Yesugei took Lady Hogelun to his tent as his wife….

[Some twenty years later] one morning just before dawn Old Woman Khogaghchin, Mother Hogelun’s servant, woke with a start, crying: “Mother! Mother! Get up! The ground is shaking, I hear it rumble. The Tayichigud must be riding back to attack us. Get up!”

Mother Hogelun jumped from her bed, saying: “Quick, wake my sons!” They woke Temujin and the others and all ran for the horses. Temujin, Mother Hogelun, and Khasar each took a horse…. Mother Hogelun lifted the baby Temulun onto her saddle. They saddled the last horse as a lead and there was no horse left for [Temujin’s wife] Lady Borte….

Old Woman Khogaghchin, who’d been left in the camp, said: “I’ll hide Lady Borte.” She made her get into a black covered cart. Then she harnessed the cart to a speckled ox. Whipping the ox, she drove the cart away from the camp down the Tungelig. As the first light of day hit them, soldiers rode up and told them to stop. “Who are you?” they asked her, and Old Woman Khogaghchin answered: “I’m a servant of Temujin’s. I’ve just come from shearing his sheep. I’m on my way back to my own tent to make felt from the wool.” Then they asked her: “Is Temujin at his tent? How far is it from here?” Old Woman Khogaghchin said: “As for the tent, it’s not far. As for Temujin, I couldn’t see whether he was there or not. I was just shearing his sheep out back.” The soldiers rode off toward the camp, and Old Woman Khogaghchin whipped the ox. But as the cart moved faster its axletree snapped. “Now we’ll have to run for the woods on foot,” she thought, but before she could start the soldiers returned. They’d made [Temujin’s half brother] Belgutei’s mother their captive, and had her slung over one of their horses with her feet swinging down. They rode up to the old woman shouting: “What have you got in that cart!” “I’m just carrying wool,” Khogaghchin replied, but an old soldier turned to the younger ones and said, “Get off your horses and see what’s in there.” When they opened the door of the cart they found Borte inside. Pulling her out, they forced Borte and Khogaghchin to ride on their horses, then they all set out after Temujin….

The men who pursued Temujin were the chiefs of the three Merkid clans, Toghtoga, Dayin Usun, and Khagatai Darmala. These three had come to get their revenge, saying: “Long ago Mother Hogelun was stolen from our brother, Chiledu.” When they couldn’t catch Temujin they said to each other: “We’ve got our revenge. We’ve taken their wives from them,” and they rode down from Mount Burkhan Khaldun back to their homes….

Having finished his prayer Temujin rose and rode off with Khasar and Belgutei. They rode to [his father’s sworn brother] Toghoril Ong Khan of the Kereyid camped in the Black Forest on the Tula River. Temujin spoke to Ong Khan, saying: “I was attacked by surprise by the three Merkid chiefs. They’ve stolen my wife from me. We’ve come to you now to say, ‘Let my father the Khan save my wife and return her.’” …

[Temujin and his allies] came down on [the Merkid chief] as if through the smoke-hole of his tent, beating down the frame of his tent and leaving it flat, capturing and killing his wives and his sons. They struck at his door-frame where his guardian spirit lived and broke it to pieces. They completely destroyed all his people until in their place there was nothing but emptiness….

As the Merkid people tried to flee from our army running down the Selenge with what they could gather in the darkness, as our soldiers rode out of the night capturing and killing the Merkid, Temujin rode through the retreating camp shouting out: “Borte! Borte!” …

When [Lady Borte] recognized Temujin’s voice, Borte leaped from her cart. Lady Borte and Old Woman Khogaghchin saw Temujin charge through the crowd and they ran to him, finally seizing the reins of his horse. All about them was moonlight. As Temujin looked down to see who had stopped him he recognized Lady Borte. In a moment he was down from his horse and they were in each other’s arms, embracing.

QUESTIONS FOR ANALYSIS

1. What do you learn from these stories about the Mongol way of life?
2. “Marriage by capture” has been practiced in many parts of the world. Can you infer from these stories why such a system would persist? What was the impact of such practices on kinship relations?
3. Can you recognize traces of the oral origins of these stories?

Chinggis Khan and the Mongol Empire

How did Chinggis Khan and his successors conquer much of Eurasia, and how did the Mongol conquests change the regions affected?

In the mid-twelfth century the Mongols were just one of many peoples in the eastern grasslands, neither particularly numerous nor especially advanced. Why then did the Mongols suddenly emerge as an overpowering force on the historical stage? One explanation is ecological. A drop in the mean annual temperature created a subsistence crisis. As pastures shrank, the Mongols and other nomads had to look beyond the steppe to get more of their food from the agricultural world. A second reason for their sudden rise was the appearance of a single individual, the brilliant but utterly ruthless Temujin (ca. 1162–1227), later and more commonly called Chinggis Khan (sometimes spelled Genghis or Ghengis).

Chinggis Khan

In Temujin's youth, his father had built a modest tribal following. When Temujin's father was poisoned by a rival, his followers, not ready to follow a boy of twelve, drifted away, leaving Temujin and his mother and brothers in a vulnerable position. Temujin slowly collected followers. In 1182 Temujin was captured and carried in a cage to a rival's camp. After a daring midnight escape, he led his followers to join a stronger chieftain whom his father had once aided. With the chieftain's help, Temujin began avenging the insults he had received.

Temujin proved to be a natural leader, and as he subdued the Tartars, Kereyids, Naimans, Merkids, and other Mongol and Turkish tribes, he built up an army of loyal followers. He mastered the art of winning allies through displays of personal courage in battle and generosity to his followers. To those who opposed him, he could be merciless. He once asserted that nothing gave more pleasure than massacring one's enemies, seizing their horses and cattle, and ravishing their women. Sometimes Temujin would kill all the men in a defeated tribe to prevent later vendettas. At other times he would take them on as soldiers in his own armies.

In 1206, at a great gathering of tribal leaders, Temujin was proclaimed **Chinggis Khan** (JING-gus kahn), or Great Ruler. Chinggis decreed that Mongol, until then an unwritten language, be written down in the script used by the Uighur Turks. With this script a record was made of the Mongol laws and customs, ranging from the rules for the annual hunt to punishments of death for robbery and adultery. Another measure adopted at this assembly was a postal relay system to send messages rapidly by mounted courier, suggesting that Chinggis already had ambitions to rule a vast empire.

Chinggis Khan The title given to the Mongol ruler Temujin in 1206; it means Great Ruler.

With the tribes of Mongolia united, the energies previously devoted to infighting and vendettas were redirected to exacting tribute from the settled populations nearby, starting with the Jurchen (Jin) state that extended into north China (see Map 13.1). Because of his early experiences with intertribal feuding, Chinggis mistrusted traditional tribal loyalties, and as he fashioned a new army, he gave it a new, nontribal decimal structure (based on units of ten). He conscripted soldiers from all the tribes and assigned them to units that were composed of members from different tribes. He selected commanders for each unit whom he could remove at will, although he allowed commanders to pass their posts on to their sons.

The Tent of Chinggis Khan In this fourteenth-century Persian illustration from Rashid al-

Din’s *History of the World*, two guards stand outside while Chinggis is in his tent.

After Chinggis subjugated a city, he would send envoys to cities farther out to demand submission and threaten destruction. Those who opened their city gates and submitted without fighting could join the Mongols, but those who resisted faced the prospect of mass slaughter. He despised city dwellers and would sometimes use them as living shields in the next battle. After the Mongol armies swept across north China in 1212–1213, ninety-odd cities lay in rubble. Not surprisingly many governors of cities and rulers of small states hastened to offer submission.

Chinggis preferred conquest to administration and did not stay in north China to set up an administrative structure. He left that to subordinates and turned his attention westward, to Central Asia and Persia, then dominated by different groups of Turks. In 1218 Chinggis proposed to the Khwarizm (QUAHR-uh-zim) shah of Persia that he accept Mongol overlordship and establish trade relations. The shah, to show his determination to resist, ordered the envoy and the merchants who had accompanied him killed. The next year Chinggis led an army of one hundred thousand soldiers west to retaliate. Mongol forces destroyed the shah’s army and sacked one Persian city after another.

After returning from Central Asia, Chinggis died in 1227 during the siege of a city in northwest China. Before he died, he instructed his sons not to fall out among themselves but instead to divide the spoils.

Chinggis’s Successors

Although Mongol leaders traditionally had had to win their positions, after Chinggis died the empire was divided into four states called **khanates**, with one of the lines of his descendants taking charge of each (Map 12.1). Chinggis’s third son, Ögödei, assumed the title of khan, and he directed the next round of invasions.

Mapping the Past

MAP 12.1 The Mongol Empire The creation of the vast Mongol Empire facilitated communication across Eurasia and led to both the spread of deadly plagues and the transfer of technical and scientific knowledge. After the death of Chinggis Khan in 1227, the empire was divided into four khanates ruled by different lines of his successors. In the 1270s the Mongols conquered southern China, but most of their subsequent campaigns did not lead to further territorial gains.

ANALYZING THE MAP Trace the campaigns of the Mongols. Which ones led to acquisition of territory, and which ones did not?

CONNECTIONS Would the division of the Mongol Empire into separate khanates have made these areas easier for the Mongols to rule? What drawbacks might it have had from the Mongols' point of view?

In 1237 representatives of all four lines led 150,000 Mongol, Turkish, and Persian troops into Europe. During the next five years, they gained control of Moscow and Kievan Rus and looted cities in Poland and Hungary. They were poised to attack deeper into Europe when they learned of the death of Ögödei in 1241. To participate in the election of a new khan, the army returned to the Mongols' new capital city, Karakorum.

Once Ögödei's son was certified as his successor, the Mongols turned their attention to Persia and the Middle East. In 1256 a Mongol army took northwest Iran, then pushed on to the Abbasid capital of Baghdad. When it fell in 1258, the last Abbasid caliph was murdered, and the population was put to the sword. The Mongol onslaught was successfully resisted, however, by both the Delhi sultanate (see "The Delhi Sultanate") and the Mamluk rulers in Egypt (see "The Mongol Invasions" in Chapter 9).

Under Chinggis's grandson Khubilai Khan (r. 1260– 1294), the Mongols completed their conquest of China. Proceeding deliberately, the Mongols first surrounded the Song empire in central and south China (see Chapter 13) by taking its westernmost province in 1252, as well as Korea to its east in 1258; destroying the Nanzhao kingdom in modern Yunnan in 1254; and then continuing south and taking Annam (northern Vietnam) in 1257. As their invasion moved forward, the Mongols used a variety of forms of battle, employing experts in naval and siege warfare from all over their empire. During their advance toward the Chinese capital of Hangzhou, the Mongols ordered the total slaughter of the people of the major city of Changzhou, and in 1276 the Chinese empress dowager surrendered in hopes of sparing the people of the capital a similar fate.

Having overrun China and Korea, Khubilai turned his eyes toward Japan, launching invasions in 1274 and 1281. On both occasions the Mongols managed to land but were beaten back by Japanese samurai armies. Each time fierce storms destroyed the Mongol fleets. The Japanese claimed that they had been saved by the *kamikaze*, the "divine wind" (which later lent its name to the thousands of Japanese aviators who crashed their airplanes into American warships during World War II). Twelve years later, in 1293, Khubilai tried sending a fleet to the islands of Southeast Asia, including Java, but it met with no more success than the fleets sent to Japan.

Mongols Conquer Baghdad The siege of Baghdad in 1258 is depicted in this illustration from Rashid al-Din's *History of the World*, which was published in Persia in the fourteenth century.

Why were the Mongols so successful against so many different types of enemies? Even though their population was tiny compared to the populations of the large agricultural societies they conquered, their tactics, their weapons, and their organization all gave them advantages. Like other nomads before them, they were superb horsemen and excellent archers. Their horses were extremely nimble, able to change direction quickly, thus allowing the Mongols to maneuver easily and ride through infantry forces armed with swords, lances, and javelins. (See "Thinking Like a Historian: The Mongol Army," page 330.)

The Mongols were also open to trying new military technologies. To attack walled cities, they learned how to use catapults and other engines of war. At first they employed Chinese catapults, but when they learned that those used by the Turks in Afghanistan were more powerful, they adopted the better model. The Mongols also used exploding arrows and gunpowder projectiles developed by the Chinese.

The Mongols made good use of intelligence and tried to exploit internal divisions in the countries they attacked. Thus in north China they appealed to the Khitans, who had been defeated by the Jurchens a century earlier, to join them in attacking the Jurchens. In Syria they exploited the resentment of Christians against their Muslim rulers.

THINKING LIKE A HISTORIAN

The Mongol Army

The Mongols received little attention from historians until they were united under Chinggis and began their military conquests. The following five documents offer different perspectives on the Mongol army.

1 **Li Xinchuan, report on the Mongol invasion of northern China, 1220.** One of the earliest surviving accounts of the Mongols' military tactics was written around 1220 by a Chinese historian, Li Xinchuan, living in south China under the Song Dynasty. He would have learned of the Mongols secondhand, as the Song had diplomatic relations with Jin, which was then under attack by the Mongols. In this passage he reports how the Tartars — referring to the Mongols — gained control of north China in 1213–1214.

■ In the spring of 1213 [the Tartars] attacked Yanjing [modern Beijing] and that fall Yunji [the Jin emperor] was killed. Chinggis left Samohe in charge of Yanjing and incorporated the 46 divisions of the surrendered [Jin] armies of Yang Boyu and Liu Bolin into the great Tartar armies, which were divided into three divisions to conquer the prefectural cities of [the circuits of] River North, River East, and Mountains East.… At this time the troops of the various circuits of north China pulled back to defend the region west of the mountains, but there were not enough troops, so commoners were drafted as soldiers and put on the tops of the city walls to defend them. The Tartars drove their family members to attack them, and fathers and sons or brothers often got close enough to recognize and call out to each other. Because of this, [the drafted soldiers] were not firmly resolved, and all of the cities surrendered as soon as the fighting began. From the twelfth month of 1213 to the first month of 1214, more than ninety prefectures fell. Every place the armies passed through was devastated. For several thousand li, throughout River East, River North, and Mountains East, the people were slaughtered. Gold and silk, boys and girls, oxen and sheep, horses and other animals were all "rolled up" and taken away. Houses were burnt down and defensive walls smashed.

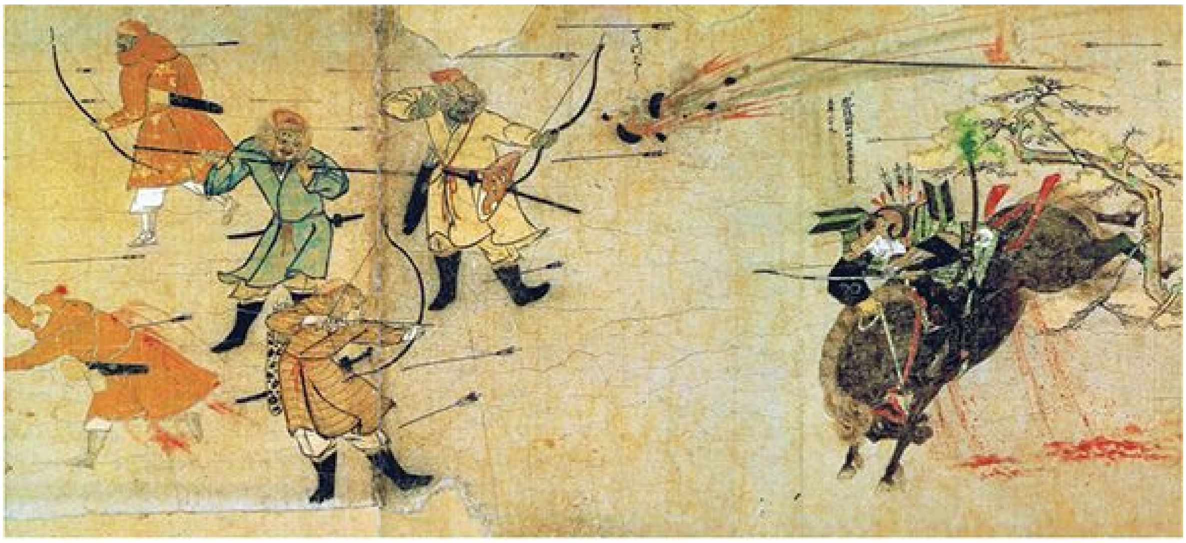
2 **John of Plano Carpini, *History of the Mongols*, 1240s.** John of Plano Carpini was a Franciscan friar sent by Pope Innocent IV to make contact with the Mongols. Although his diplomacy did not achieve its purpose, he wrote a full account of what he observed about the Mongols during his 1245–1247 travels.

■ Having spoken of their empire, we will now deal with war in the following manner: first we will tell of their battle array, second of their arms, thirdly of their cunning in engagements, fourthly of the cruelty they show to captives, fifthly of how they make assaults on forts and cities, and sixthly of the bad faith they show to those who surrender to them.…

When however they are going to join battle, they draw up all the battle lines just as they are to fight. The chiefs or princes of the army do not take part in the fighting but take up their stand some distance away facing the enemy…. They send a detachment of captives and men of other nationalities who are fighting with them to meet the enemy head-on, and some Tartars may perhaps accompany them. Other columns of stronger men they dispatch far off to the right and the left so that they are not seen by the enemy and in this way they surround them and close in and so the fighting begins from all sides….

All those they take prisoner in battle they put to death unless they happen to want to keep some as slaves. They divide those who are to be killed among the captains of a hundred to be executed by them with a battle-axe; they in their turn divide them among the captives, giving each slave to kill ten or more or less as the officers think fit.

3 **Scene from the *Moko Shurai Ekotoba,* 1293.** After repelling the Mongol invaders in 1274, some of the Japanese samurai who fought wished to document their accomplishment by having a pictorial scroll of it made, to show their valor.



Pictures from History/Bridgeman Images

4 **Zhu Sisun, testimony on the 1236 Mongol attack in Sichuan.** Zhu Sisun (1214–1280), who survived the Mongol slaughter in Sichuan in 1236, later reported what he went through (referring to himself by his own name). This was the Mongols’ first major attack on the Southern Song.

■ Here is how the people of Sichuan went to their deaths: groups of fifty people were clustered together, and the Mongols impaled them all with swords and piled up the corpses. At sunset, those who did not appear dead were again stabbed. Sisun lay at the bottom of a pile of corpses, and by chance the evening stabbing did not reach him. The blood of the corpses above him dripped steadily into his mouth. Halfway through the night Sisun began to revive, and crawling into the woods he made his escape.

5 **Marco Polo, *Description of the World,* ca. 1300.** The Venetian Marco Polo (ca. 1254–1324) accompanied his father and uncle to China, arriving at age twenty-one and staying sixteen years. After he returned to Italy, he dictated his account to a storyteller named Rusticello. His admiration for the Mongol rulers is evident in many of his accounts.

■ They are brave in battle, almost to desperation, setting little value upon their lives, and exposing themselves without hesitation to all manner of danger. Their disposition is cruel. They are capable of supporting every kind of privation, and when there is a necessity for it, can live for a month on the milk of their mares, and upon such wild animals as they may chance to catch. The men are habituated to remain on horseback during two days and two nights, without dismounting, sleeping in that situation whilst their horses graze. No people on earth can surpass them in fortitude under difficulties, nor show greater patience under wants of every kind.

ANALYZING THE EVIDENCE

1. How would you explain the differences in what the writers of Sources 1, 2, 4, and 5 chose to mention?
2. Does anything in the accounts in Sources 1, 2, 4, or 5 seem exaggerated? How can you judge?
3. Does the visual depiction in Source 3 offer anything that the textual sources do not?
4. If you were writing a history of the Mongols, would you consider all the sources equally valid as evidence, or would you find some more reliable than others?

PUTTING IT ALL TOGETHER

Using the sources above, along with what you have learned in class and in this chapter, write a short essay that analyzes the Mongol army and its tactics.

The Mongols as Rulers

The success of the Mongols in ruling vast territories was due in large part to their willingness to incorporate other ethnic groups into their armies and governments. Whatever their original country or religion, those who served the Mongols loyally were rewarded. Uighurs, Tibetans, Persians, Chinese, and Russians came to hold powerful positions in the Mongol governments.

Since, in Mongol eyes, the purpose of fighting was to gain riches, the Mongols would regularly loot the settlements they conquered, taking whatever they wanted, including the residents. Land would be granted to military commanders, nobles, and army units to be governed and exploited as the recipients wished. Those working the land would be given to them as serfs. The Mongols built a capital city called Karakorum in modern Mongolia, and to bring it up to the level of the cities they conquered, they transported skilled workers from those cities. For instance, after Bukhara and Samarkand were captured in 1219–1220, some thirty thousand artisans were enslaved and transported to Mongolia.

The traditional nomad disdain for farmers led some commanders to suggest turning north China into a gigantic pasture after it was conquered. In time, though, the Mongols came to realize that simply appropriating the wealth and human resources of the settled lands was not as good as extracting regular revenue from them. The Mongols gave Chinese methods of taxation a try, but soon political rivals convinced the khan that he would gain even more by letting Central Asian Muslim merchants bid against each other for licenses to collect taxes any way they could, a system called **tax-farming**. Ordinary Chinese found this method of tax collecting much more oppressive than traditional Chinese methods, since there was little to keep the tax collectors from seizing everything they could.

tax-farming Assigning the collection of taxes to whoever bids the most for the privilege.

By the second half of the thirteenth century there was no longer a genuine pan-Asian Mongol Empire. Much of Asia was in the hands of Mongol successor states, but these were generally hostile to each other. Khubilai was often at war with the khanate of Central Asia, then held by his cousin Khaidu, and he had little contact with the khanate of the Golden Horde in south Russia. The Mongols adapted their methods of government to the existing traditions of each place they ruled, and the regions went their separate ways.

In China the Mongols resisted assimilation and purposely avoided many Chinese practices. The rulers conducted their business in the Mongol language and spent their summers in Mongolia. Khubilai discouraged Mongols from marrying Chinese and took only Mongol women into the palace. Chinese were treated as legally inferior not only to the Mongols but also to all other non-Chinese.

In Central Asia, Persia, and Russia the Mongols tended to merge with the Turkish groups already there and, like them, converted to Islam. Russia in the thirteenth century was not a strongly centralized state, and the Mongols allowed Russian princes and lords to continue to rule their territories as long as they turned over adequate tribute. The city of Moscow became the center of Mongol tribute collection and grew in importance. In the Middle East the Mongol Il-khans (as they were known in Persia) were more active as rulers, again continuing the traditions of the caliphate. In Mongolia itself, however, Mongol traditions were maintained.

Mongol control in each of the khanates lasted about a century. In the mid-fourteenth century the Mongol dynasty in China deteriorated into civil war, and in the 1360s the Mongols withdrew back to Mongolia. There was a similar loss of Mongol power in Persia and Central Asia. Only on the south Russian steppe did the Golden Horde maintain its hold for another century.

As Mongol rule in Central Asia declined, a new conqueror emerged, Timur, also known as Tamerlane (Timur the Lame). Not a nomad but a highly civilized Turkish noble, Timur in the 1360s struck out from his base in Samarkand into Persia, north India (see “The Delhi Sultanate”), southern Russia, and beyond. His armies used the terror tactics that the Mongols had perfected, massacring the citizens of cities that resisted. In the decades after his death in 1405, however, Timur’s empire went into decline.

East-West Communication During the Mongol Era

How did the Mongol conquests facilitate the spread of ideas, religions, inventions, and diseases?

The Mongol governments did more than any earlier political entities to encourage the movement of people and goods across Eurasia. With these vast movements came cultural accommodation as the Mongols, their conquered subjects, and their trading partners learned from one another. This cultural exchange involved both physical goods and the sharing of ideas, including the introduction of new religious beliefs and the adoption of new ways to organize and rule the Mongol Empire. It also facilitated the spread of the plague and the unwilling movement of enslaved captives.

The Movement of Peoples

The Mongols had never looked down on merchants the way the elites of many traditional states did, and they welcomed the arrival of merchants from distant lands. Even when different groups of Mongols were fighting among themselves, they usually allowed caravans to pass without harassing them.

The Mongol practice of transporting skilled people from the lands they conquered also brought people into contact with each other in new ways. Besides those forced to move, the Mongols recruited administrators from all over. Especially prominent were the Uighur Turks of Chinese Central Asia, whose familiarity with Chinese civilization and fluency in Turkish were extremely valuable in facilitating communication.

One of those who served the Mongols was Rashid al-Din (ca. 1247–1318). A Jew from Persia and the son of an apothecary, Rashid al-Din converted to Islam at the age of thirty and entered the service of the Mongol Il-khan of Persia as a physician. He rose in government service, traveled widely, and eventually became prime minister. Rashid al-Din became friends with the ambassador from China, and together they arranged for translations of Chinese works on medicine, agronomy, and statecraft. Aware of the great differences between cultures, he believed that the Mongols should try to rule in accord with the moral principles of the majority in each land. On that basis he convinced the Mongol khan of Persia to convert to Islam. Rashid al-Din undertook to explain the great variety of cultures by writing a world history more comprehensive than any previously written. (See “Global Viewpoints: Explaining the Workings of Paper Money in China, Persia, and Europe,” page 332.)

The Mongols were remarkably open to religious experts from all the lands they encountered. More Europeans made their way as far as Mongolia and China in the Mongol period than ever before. Popes and kings sent envoys to the Mongol court in the hope of enlisting the Mongols on their side in their long-standing conflict with Muslim forces over the Holy Land. European visitors were also interested in finding Christians who had been cut off from the West by the spread of Islam, and in fact there were considerable numbers of Nestorian Christians in Central Asia.

Planting Trees The illustrations in early copies of Marco Polo’s book show the elements that Europeans found most interesting. This page illustrates Khubilai’s order that trees be planted along the main roads.

The most famous European visitor to the Mongol lands was the Venetian Marco Polo (ca. 1254–1324). In his famous *Description of the World*, Marco Polo described all the places he visited or learned about during his seventeen years away from home. He reported being warmly received by Khubilai, who impressed him enormously. He was also awed by the wealth and splendor of Chinese cities and spread the notion of Asia as a land of riches.

GLOBAL VIEWPOINTS

Explaining the Workings of Paper Money in China, Persia, and Europe

In China the Mongols maintained the established practice of circulating paper money (see "The Medieval Chinese Economic Revolution" in Chapter 13), which amazed visitors from other parts of Eurasia. The three texts below give different perspectives on the use of paper money. The first is a legal ruling issued in 1291 by the Mongols in China, the second is Marco Polo's description of the practice as he witnessed it in the 1290s, and the third is Rashid al-Din's account of the failed attempt to introduce the practice in Mongol-ruled Persia in 1294.

The Yuan Code of 1291

■ At any Treasury for Note Circulation, when a person comes to exchange worn-out notes for new notes, the responsible official shall oversee the counting of the notes in the presence of the owner. If none of the notes are patched or counterfeited, the official shall apply the stamp "Exchanged" to them and place them in the treasury and hand over new notes to the owner. The supervising authorities shall send inspectors to make frequent inspections. Any violator of these provisions shall be investigated and punished.

Marco Polo

■ The coinage of this paper money is authenticated with as much form and ceremony as if it were actually pure gold or silver; for to each note a number of officers, specially appointed, not only subscribe their names, but affix their seals also…. This paper currency is circulated in every part of the Great Khan's dominions; nor dares any person, at the peril of his life, refuse to accept it in payment. All his subjects receive it without hesitation, because, wherever their business may call them, they can dispose of it again in the purchase of merchandise they may require….

When any person happens to be possessed of paper money which from long use has become damaged, they carry it to the mint, where, upon the payment of only three per cent, they receive fresh notes in exchange. Should any be desirous of procuring gold or silver for the purpose of manufacture, such as of drinking-cups, girdles, or other articles wrought of these metals, they in like manner apply to the mint, and for their paper obtain the bullion they require.

Rashid al-Din

■ On Friday [July 27, 1294], Akbuka, Togachar, Sadr al-Din, and Tamachi-Inak went to Tabriz to launch the paper money [*chao*]. They arrived there on [August 13], promulgated the decree, and prepared a great quantity of paper money. On Saturday [September 12, 1294], in the city of Tabriz, they put the paper money into circulation. The decree laid down that any person who refused to accept it would be summarily executed. For one week, in fear of the sword, they accepted it, but they gave very little in return. Most of the people of Tabriz perforce chose to leave, taking the textiles and foodstuffs from the bazaars with them, so that nothing was available, and people who wanted to eat fruit went secretly to the orchards. The city, which had been so populous, was completely emptied of people. Vagabonds and ruffians looted whatever they found in the streets. Caravans ceased to go there….

Sadr al-Din, affected by the words [of a dervish], and with the assent of the retainers after this ruination, obtained a decree authorizing the sale of foodstuffs for gold. Because of this people became bold and transacted business openly in gold, and the absent returned to the city, and within a short time it was flourishing again. In the end, the attempt to introduce paper money did not succeed.

QUESTIONS FOR ANALYSIS

1. What do you learn about the processes of cultural borrowing from these sources?
2. What features of paper money most impressed Marco Polo?
3. What made it difficult to introduce paper money in Tabriz?

The Spread of Disease, Goods, and Ideas

The rapid transfer of people and goods across Central Asia spread more than ideas and inventions. It also spread diseases, the most deadly of which was the plague known in Europe as the Black Death, which scholars identify today as the bubonic plague. In the early fourteenth century, transmitted by rats and fleas, the plague began to spread from Central Asia into West Asia, the Mediterranean, and western Europe. The confusion of the mid-fourteenth century that led to the loss of Mongol power in China, Iran, and Central Asia undoubtedly owes something to the effect of the spread of the plague and other diseases. (For more on the Black Death, see Chapter 14.)

Traditionally, the historians of each of the countries conquered by the Mongols portrayed them as a scourge. Among contemporary Western historians, it is now more common to celebrate the genius of the Mongol military machine and treat the spread of ideas and inventions as an obvious good. There is no reason to assume, however, that people benefited equally from the improved communications and the new political institutions of the Mongol era. Merchants involved in long-distance trade prospered, but those enslaved and transported hundreds or thousands of miles from home would have seen themselves not as the beneficiaries of opportunities to encounter cultures different from their own but rather as the most pitiable of victims. Moreover, the places that were ruled by Mongol governments for a century or more — China, Central Asia, Persia, and Russia — do not seem to have advanced at a more rapid rate during that century than they did in earlier centuries, either economically or culturally.

In terms of the spread of technological and scientific ideas, Europe seems to have been by far the main beneficiary of increased communication, largely because in 1200 it lagged farther behind than the other areas. Chinese inventions such as printing, gunpowder, and the compass spread westward. Persian and Indian expertise in astronomy and mathematics also spread. In terms of the spread of religions, Islam probably gained the most. It came to dominate in Chinese Central Asia, which had previously been Buddhist.

India, Islam, and the Development of Regional Cultures, 300–1400

What was the result of India's encounters with Turks, Mongols, and Islam?

After the Mauryan Empire broke apart in 185 B.C.E. (see "The Reign of Ashoka" in Chapter 3), India was politically divided into small kingdoms for several centuries. Only the Guptas in the fourth century would emerge to unite much of north India, though their rule was cut short by the invasion of the Huns in about 450. A few centuries later, India was profoundly shaped by Turkish nomads from Central Asia who brought their culture and, most important, Islam to India. Despite these events, the lives of most Indians remained unchanged, with the majority of the people living in villages in a society defined by caste.

The Gupta Empire, ca. 320–480

In the early fourth century a state emerged in the Ganges plain that was able to bring large parts of north India under its control. The rulers of this Indian empire, the Guptas, consciously modeled their rule after that of the Mauryan Empire, and the founder took the name of the founder of that dynasty, Chandragupta. The Guptas united north India and received tribute from states in Nepal and the Indus Valley, thus giving large parts of India a period of peace and political unity.

The Gupta Empire, ca. 320–480

The Guptas' administrative system was not as centralized as that of the Mauryans. In the central regions they drew their revenue from a tax on agriculture of one-quarter of the harvest and maintained monopolies on key products such as metals and salt (reminiscent of Chinese practice). They also exacted labor service for the construction and upkeep of roads, wells, and irrigation systems. More distant areas were assigned to governors who were allowed considerable leeway, and governorships often became hereditary. Areas still farther away were encouraged to become vassal states.

The Gupta kings were patrons of the arts. Poets composed epics for the courts of the Gupta kings, and other writers experimented with prose romances and popular tales. India's greatest poet, Kalidasa (ca. 380–450), like Shakespeare, wrote poems as well as plays in verse.

In mathematics, too, the Gupta period could boast of impressive intellectual achievements. The so-called Arabic numerals are actually of Indian origin. Indian mathematicians developed the place-value notation system, with separate columns for ones, tens, and hundreds, as well as a zero sign to indicate the absence of units in a given column. This system greatly facilitated calculation and had spread as far as Europe by the seventh century.

The Gupta rulers were Hindus, but they tolerated all faiths. Buddhist pilgrims from other areas of Asia reported that Buddhist monasteries with hundreds or even thousands of monks and nuns flourished in the cities. The success of Buddhism did not hinder Hinduism with its many gods, which remained popular among ordinary people.

The great crisis of the Gupta Empire was the invasion of the Huns in about 450. Mustering his full might, the Gupta ruler Skandagupta (r. ca. 455–467) threw back the invaders, but they had dealt the dynasty a fatal blow.

Wall Painting at Ajanta Many of the best surviving examples of Gupta period painting are found at the twenty-nine Buddhist cave temples at Ajanta in central India. The walls of these caves were decorated in the fifth and sixth centuries with scenes from the former lives of the Buddha. This scene shows members of different castes.

India’s Medieval Age and the First Encounter with Islam

After the decline of the Gupta Empire, India once again broke into separate kingdoms that were frequently at war with each other. Most of the dynasties of India’s medieval age (ca. 500–1400) were short-lived, but a balance of power was maintained between the major regions of India, with none gaining enough of an advantage to conquer the others. Particularly notable are the Cholas, who dominated the southern tip of the peninsula, Sri Lanka, and much of the eastern Indian Ocean to the twelfth century (see Map 12.2, page 339).

Political division fostered the development of regional cultures. Literature came to be written in India’s regional languages, among them Marathi, Bengali, and Assamese. Commerce continued as before, and the coasts of India remained important in the sea trade of the Indian Ocean.

The first encounters with Islam occurred in this period. In 711 the Umayyad governor of Iraq seized the Sind area in western India (modern Pakistan). The western part of India remained part of the caliphate for centuries, but Islam did not spread much beyond this foothold. During the ninth and tenth centuries Turks from Central Asia moved into the region of today's northeastern Iran and western Afghanistan, then known as Khurasan. Converts to Islam, they first served as military forces for the caliphate in Baghdad, but as its authority weakened, they made themselves rulers of an effectively independent Khurasan and frequently sent raiding parties into north India. Beginning in 997 Mahmud of Ghazni (r. 997–1030) led seventeen annual forays into India from his base in modern Afghanistan. He systematically looted Indian palaces and temples, viewing religious statues as infidels' idols. Eventually the Arab conquerors of the Sind fell to the Turks. By 1030 the Indus Valley, the Punjab, and the rest of northwest India were in the grip of the Turks.

Kandariyâ Mahâdeva Hindu Temple Built around 1050 by a local king in central India, this is one of the best-preserved Hindu temples from the medieval period. The main spire rises 100 feet, and the sides are decorated with more than six hundred stone statues.

The new rulers encouraged the spread of Islam, but the Indian caste system (see "Life in Early India" in Chapter 3) made it difficult to convert higher-caste Indians. Notions of purity were fundamental, as a Persian scholar explained:

> They totally differ from us in religion, as we believe in nothing in which they believe, and vice versa. On the whole, there is very little disputing about theological topics among them; at the utmost they fight with words, but they will never stake their soul or body or property on religious controversy…. They call foreigners impure and forbid having any connection with them, be it by intermarriage or any kind of relationship, or by sitting, eating, and drinking with them, because thereby, they think, they would be polluted.[2]

After the initial period of raids and destruction of temples, the Muslim Turks came to an accommodation with the Hindus, who were classed as a **protected people**, like the Christians and Jews, and allowed to follow their religion. They had to pay a special tax but did not have to perform military service. Local chiefs and rajas were often allowed to remain in control of their domains as long as they paid tribute. Most Indians looked on the Muslim conquerors as a new ruling caste, capable of governing and taxing them but otherwise peripheral to their lives. The myriad castes largely governed themselves, isolating the newcomers.

protected people The Muslim classification used for Hindus, Christians, and Jews; they were allowed to follow their religions but had to pay a special tax.

Nevertheless, over the course of several centuries Islam gained a stronghold on north India, especially in the Indus Valley (modern Pakistan) and in Bengal at the mouth of the Ganges River (modern Bangladesh). Moreover, the sultanate seems to have had a positive effect on the economy. Much of the wealth confiscated from temples was put to more productive use, and India's first truly large cities emerged. The Turks also were eager to employ skilled workers, giving new opportunities to low-caste manual and artisan labor.

The Muslim rulers were much more hostile to Buddhism than to Hinduism, seeing Buddhism as a competitive proselytizing religion. In 1193 a Turkish raiding party destroyed the great Buddhist university at Nalanda in Bihar. Buddhist monks were killed or forced to flee to Buddhist centers in Southeast Asia, Nepal, and Tibet. Buddhism, which had thrived for so long in peaceful and friendly competition with Hinduism, subsequently went into decline in its native land.

Hinduism, however, remained as strong as ever. South India was largely unaffected by these invasions, and traditional Hindu culture flourished there under native kings ruling small kingdoms. (See "Individuals in Society: Bhaskara the Teacher," at right.) Devotional cults and mystical movements flourished. This was a great age of religious art and architecture in India. Extraordinary temples covered with elaborate bas-relief were built in many areas.

Bhaskara the Teacher

The observatory where Bhaskara worked in Ujjain today stands in ruins.

IN INDIA, AS IN MANY OTHER SOCIETIES, ASTRONOMY and mathematics were closely linked, and many of the most important mathematicians served their rulers as astronomers. Bhaskara (1114–ca. 1185) was such an astronomer- mathematician. For generations his Brahmin family had been astronomers at the Ujjain astronomical observatory in north-central India, and his father had written a popular book on astrology.

Bhaskara was a highly erudite man. A disciple wrote that he had thoroughly mastered eight books on grammar, six on medicine, six on philosophy, five on mathematics, and the four Vedas. Bhaskara eventually wrote six books on mathematics and mathematical astronomy. They deal with solutions to simple and quadratic equations and show his knowledge of trigonometry, including the sine table and relationships between different trigonometric functions, and even some of the basic elements of calculus.

A court poet who centuries later translated Bhaskara's book titled *The Beautiful* explained its title by saying Bhaskara wrote it for his daughter named Beautiful (Lilavati) as consolation when his divination of the best time for her to marry went awry. Whether Bhaskara did or did not write this book for his daughter, many of the problems he provides in it have a certain charm:

> On an expedition to seize his enemy’s elephants, a king marched two yojanas the first day. Say, intelligent calculator, with what increasing rate of daily march did he proceed, since he reached his foe’s city, a distance of eighty yojanas, in a week?*
>
> Out of a heap of pure lotus flower, a third part, a fifth, and a sixth were offered respectively to the gods Siva, Vishnu, and the Sun; and a quarter was presented to Bhavani. The remaining six lotuses were given to the venerable preceptor. Tell quickly the whole number of lotus.†
>
> If eight best variegated silk scarfs, measuring three cubits in breadth and eight in length, cost a hundred nishkas, say quickly, merchant, if thou understand trade, what a like scarf, three and a half cubits long and half a cubit wide will cost.‡

Bhaskara had a long career. His first book on mathematical astronomy, written in 1150 when he was thirty-six, used mathematics to calculate solar and lunar eclipses or planetary conjunctions. Thirty-three years later he was still writing on the subject, this time providing simpler ways to solve problems encountered before. Bhaskara wrote his books in Sanskrit, already a literary language rather than a vernacular language, but even in his own day some of them were translated into other Indian languages.

QUESTIONS FOR ANALYSIS

1. What might have been the advantages of making occupations like astronomer hereditary in India?
2. Are the problems Bhaskara poses ones that people would face in ordinary life?

†The answer is 120.

‡The answer, from the formula $x = (1 \times 7 \times 1 \times 100) / (8 \times 3 \times 8 \times 2 \times 2)$, is given in currencies smaller than the nishka: 14 drammas, 9 panas, 1 kakini, and 6 $^{2/3}$ cowry shells. (20 cowry shells = 1 kakini, 4 kakini = 1 pana, 16 panas = 1 dramma, and 16 drammas = 1 nishka.)

The Delhi Sultanate

In the twelfth century a new line of Turkish rulers arose in Afghanistan, led by Muhammad of Ghur (d. 1206). Muhammad captured Delhi and extended his control nearly throughout north India. When he fell to an assassin in 1206, one of his generals, the former slave Qutb-ud-din, seized the reins of power and established a government at Delhi, separate from the government in Afghanistan. This sultanate of Delhi lasted for three centuries, even though dynasties changed several times.

A major accomplishment of the Delhi sultanate was holding off the Mongols. Chinggis Khan and his troops entered the Indus Valley in 1221 in pursuit of the shah of Khurasan. The sultan wisely kept out of the way, and when Chinggis Khan left some troops in the area, the sultan made no attempt to challenge them. Two generations later, in 1299, a Mongol khan launched a campaign into India with two hundred thousand men, but the sultan of the time was able to defeat them. Two years later the Mongols returned and camped at Delhi for two months, but they eventually left without taking the sultan’s fort. Another Mongol raid in 1306–1307 also was successfully repulsed.

During the fourteenth century, however, the Delhi sultanate was in decline and proved unable to ward off the armies of Timur, who took Delhi in 1398. Timur’s invasion left a weakened sultanate. The Delhi sultanate endured under different rulers until 1526, when it was conquered by the Mughals, a Muslim dynasty that would rule over most of northern India from the sixteenth into the nineteenth century.

Life in Medieval India

Local institutions played a much larger role in the lives of people in medieval India than did the state. Craft guilds oversaw conditions of work and trade, local councils handled law and order at the town or village level, and local castes gave members a sense of belonging and identity.

Like peasant societies elsewhere, including in China, Japan, and Southeast Asia, agricultural life in India ordinarily meant village life. The average farmer worked a small plot of land outside the village. All the family members pooled their resources — human, animal, and material — under the direction of the head of the family. These joint efforts strengthened family solidarity.

Men at Work This stone frieze from the Buddhist stupa in Sanchi depicts Indian men doing a variety of everyday jobs. Although the stone was carved to convey religious ideas, we can use it as a source for such details of daily life as the sort of clothing men wore while working and how they carried loads.

The agricultural year began with spring plowing. The traditional plow, drawn by two oxen wearing yokes and collars, had an iron-tipped share and a handle with which the farmer guided it. Rice, the most important grain, was sown at the beginning of the long rainy season. Beans, lentils, and peas were the farmer's friends, for they grew during the cold season and were harvested in the spring, when fresh food was scarce. Cereal crops such as wheat, barley, and millet provided carbohydrates and other nutrients. Some families cultivated vegetables, spices, fruit trees, and flowers in their gardens. Sugarcane was another important crop.

Farmers also raised livestock. Most highly valued were cattle, which were raised for plowing and milk, hides, and horns, but Hindus did not slaughter them for meat. Like the Islamic and Jewish prohibition on the consumption of pork, the eating of beef was forbidden among Hindus.

Local craftsmen and tradesmen were frequently organized into guilds, with guild heads and guild rules. The textile industries were particularly well developed. Textiles were produced in large quantities and traded throughout India and beyond. The cutting and polishing of precious stones was another industry associated closely with foreign trade.

In the cities shops were open to the street; families lived on the floors above. The busiest tradesmen dealt in milk and cheese, oil, spices, and perfumes. In addition to these tradesmen and merchants, a host of peddlers shuffled through towns and villages selling everything from needles to freshly cut flowers.

During the first millennium C.E., the caste system reached its mature form. Within the broad division into the four varnas (strata) of Brahmin, Kshatriya, Vaishya, and Shudra (see “Life in Early India” in Chapter 3), the population was subdivided into numerous castes, or **jati**. Each caste had a proper occupation. In addition, its members married only within the caste and ate only with other members. Members of high-status castes feared pollution from contact with lower-caste individuals and had to undertake rituals of purification to remove the taint.

jati The thousands of Indian castes.

Eventually Indian society comprised perhaps as many as three thousand castes. Each caste had its own governing body, which enforced the rules of the caste. Those incapable of living up to the rules were expelled, becoming outcastes. These unfortunates lived hard lives, performing tasks that others considered unclean or lowly.

Villages were often walled, as in north China and the Middle East. Cattle and sheep roamed as freely as people. Some families kept pets, such as cats or parrots. Half-wild mongooses served as effective protection against snakes. The pond outside the village was its main source of water and also a spawning ground for fish, birds, and mosquitoes. After the farmers returned from the fields in the evening, the village gates were closed until morning.

For all members of Indian society regardless of caste, marriage and family were the focus of life. As in China, the family was under the authority of the eldest male, who might take several wives, and ideally sons stayed home with their parents after they married. The family affirmed its solidarity by the religious ritual of honoring its dead ancestors — a ritual that linked the living and the dead, much like ancestor worship in China (see “Shang Society” in Chapter 4). People commonly lived in extended families: grandparents, uncles and aunts, cousins, and nieces and nephews all lived together in the same house or compound.

Children in poor households worked as soon as they were able. Children in wealthier households faced the age-old irritations of learning reading, writing, and arithmetic. Less attention was paid to daughters than to sons, though in more prosperous families they were often literate. Because girls who had lost their virginity could seldom hope to find good husbands, daughters were customarily married as children, with consummation delayed until they reached puberty.

A wife was expected to have no life apart from her husband. A widow was expected to lead the hard life of the ascetic: sleeping on the ground; eating only one simple meal a day, without meat, wine, salt, or honey; wearing plain, undyed clothes without jewelry; and shaving her head. She was viewed as inauspicious to everyone but her children, and she did not attend family festivals. Among high-caste Hindus, a widow would be praised for throwing herself on her husband's funeral pyre. Buddhist sects objected to this practice, called **sati**, but some Hindu religious authorities declared that by self-immolation a widow could expunge both her own and her husband's sins, so that both would enjoy eternal bliss in Heaven.

sati A practice whereby a high-caste Hindu woman would throw herself on her husband's funeral pyre.

Within the home the position of a wife depended on her own intelligence and strength of character. Wives were supposed to be humble, cheerful, and diligent, even toward worthless husbands. As in other patriarchal societies, however, occasionally a woman ruled the household. For women who did not want to accept the strictures of married life, the main way out was to join a Buddhist or Jain religious community.

Southeast Asia, the Pacific Islands, and the Growth of Maritime Trade

How did states develop along the maritime trade routes of Southeast Asia and beyond?

Much as Roman culture spread to northern Europe and Chinese culture spread to Korea, Japan, and Vietnam, in the first millennium C.E. Indian learning, technology, and material culture spread to the mainland and islands of Southeast Asia. The spread of Indian culture was facilitated by the growth of maritime trade, but this interchange did not occur uniformly, and by 1400 there were still isolated societies in this region, most notably in the Pacific Islands east of Indonesia.

Southeast Asia is a tropical region that is more like India than China. The topography of mainland Southeast Asia is marked by north-south mountain ranges separated by river valleys (Map 12.2). It was easy for people to migrate south along these rivers but harder for them to cross the heavily forested mountains that divided the region into areas that had limited contact with each other. The indigenous population was originally mostly Malay, but migrations over the centuries brought many other peoples, including speakers of Austro-Asiatic (such as Vietnamese and Cambodian), Austronesian (such as Malay and Polynesian), and Sino-Tibetan-Burmese (such as Burmese and possibly Thai) languages, some of whom moved to the islands offshore and farther into the Pacific Ocean.

State Formation and Indian Influences

Southeast Asia was long a crossroads. Traders from China, India, Africa, and Europe either passed through the region when traveling from the Indian to the Pacific Ocean or came for its resources, notably spices (Map 12.3).

MAP 12.3 The Spice Trade, ca. 100 B.C.E.–1500 C.E. From ancient times on, the high demand for spices was a major reason for both Europeans and Chinese to trade with South and Southeast Asia. Spices were used not only for flavor in food but also for medicinal purposes. The spice trade was largely a maritime one, conducted through a series of middlemen who shipped between ports.

The northern part of modern Vietnam was under Chinese political control off and on from the second century B.C.E. to the tenth century C.E. (see “Vietnam” in Chapter 7), but Indian influence was of much greater significance for the rest of Southeast Asia. The first state to appear in historical records, called Funan by Chinese visitors, had its capital in southern Vietnam. In the first to sixth centuries C.E. Funan extended its control over much of Indochina and the Malay Peninsula. Merchants from northwest India would offload their goods and carry them across the narrowest part of the Malay Peninsula. The ports of Funan offered food and lodging to the merchants as they waited for the winds to shift to continue their voyages. Brahmin priests and Buddhist monks from India settled along with the traders, serving the Indian population and attracting local converts. Rulers often invited Indian priests and monks to serve under them.

Sixth-century Chinese sources report that the Funan king lived in a multistory palace and the common people lived in houses built on piles with roofs of bamboo leaves. The king rode around on an elephant, but narrow boats measuring up to ninety feet long were a more important means of transportation. The people enjoyed both cockfighting and pig fighting. Instead of drawing water from wells, as the Chinese did, they made pools, from which dozens of nearby families would draw water.

After the decline of Funan, maritime trade continued to grow, and petty kingdoms appeared in many places. Indian traders frequently established small settlements, generally located on the coast. Contact with the local populations led to intermarriage and the creation of hybrid cultures. Local rulers often adopted Indian customs and values, embraced Hinduism and Buddhism, and learned **Sanskrit**, India's classical literary language. Sanskrit gave different peoples a common mode of written expression, much as Chinese did in East Asia and Latin did in Europe.

Sanskrit India's classical literary language.

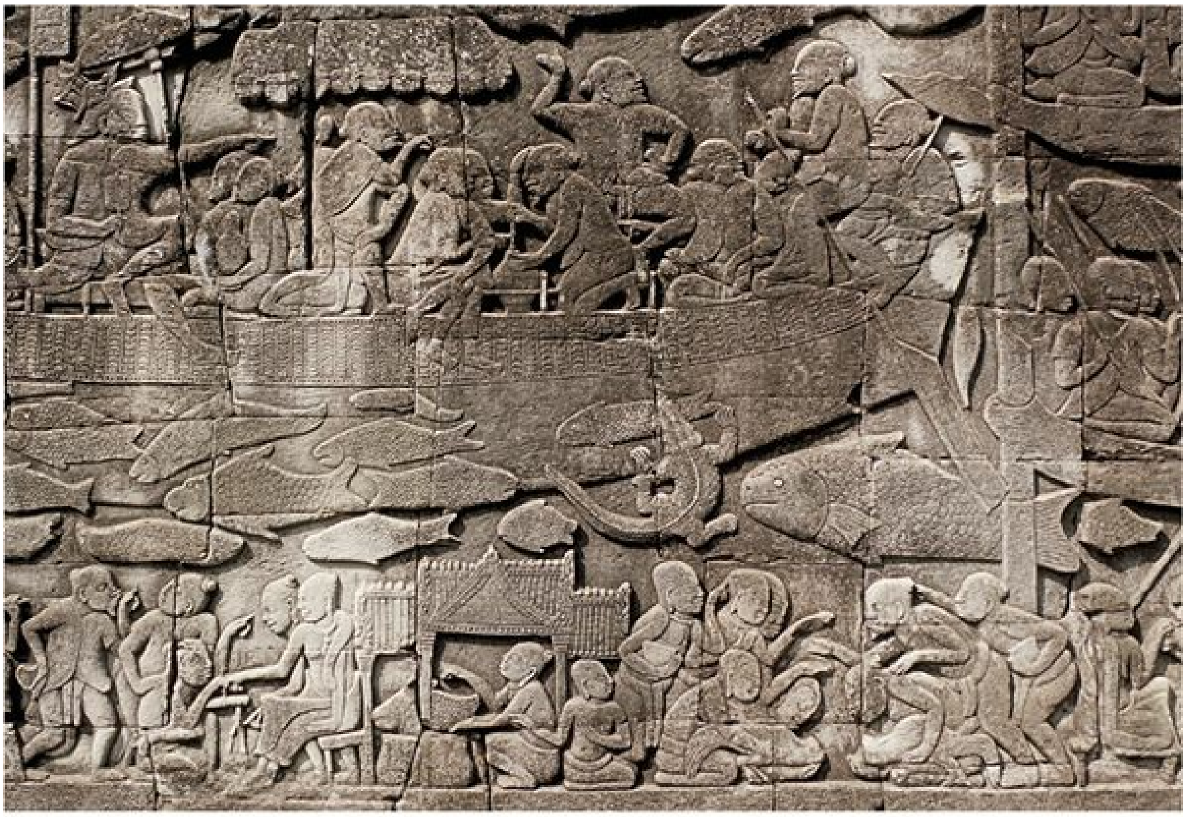
When Indian traders, migrants, and adventurers entered mainland Southeast Asia, they encountered both long-settled peoples and migrants moving southward from the frontiers of China. As in other extensive migrations, the newcomers fought one another as often as they fought the native populations. In 939 the north Vietnamese became independent of China and extended their power southward along the coast of present-day Vietnam. The Thais had long lived in what is today southwest China and north Myanmar. In the eighth century the Thai tribes united in a confederacy and expanded northward against Tang China. Like China, however, the Thai confederacy fell to the Mongols in 1253. Still farther west another tribal people, the Burmese, migrated to the area of modern Myanmar in the eighth century. They also established a state, which they ruled from their capital, Pagan, and came into contact with India and Sri Lanka.

The most important mainland state was the Khmer (kuh-MAIR) Empire of Cambodia (802–1432), which controlled the heart of the region. The Khmers were indigenous to the area. Their empire eventually extended south to the sea and the northeast Malay Peninsula. Indian influence was pervasive; the impressive temple complex at Angkor Wat built in the early twelfth century was dedicated to the Hindu god Vishnu. (See "Analyzing the Evidence: Bayon Relief at Angkor Thom," page 342.)

Social organization, however, was modeled not on the Indian caste system but on indigenous traditions of social hierarchy. A large part of the population was of slave status, many descended from non-Khmer mountain tribes defeated by the Khmers. Generally successful in a long series of wars with the Vietnamese, the Khmers reached the peak of their power in 1219 and then gradually declined.

ANALYZING THE EVIDENCE

Bayon Relief at Angkor Thom



Hervé Champollion/akg-images

The Khmer were master builders, devoting great resources to constructing stone temples and palaces and decorating them with stone statues and pictorial reliefs. Some forty sites can be visited today, spread out over an area of 70 square miles. The most famous is Angkor Wat, built in the early twelfth century by King Suryavarman II. It drew on Hindu religious traditions and was dedicated to the Hindu god Vishnu. Less than a century after its construction, another magnificent city was built about a mile north. This complex, Angkor Thom, was built as the official state temple of King Jayavarman VII, perhaps because he was a Mahayana Buddhist and wanted a Buddhist complex that would rival the magnificence of his predecessor's Hindu complex.

Angkor Thom is especially notable for the Bayon Relief, a series of bas-reliefs depicting mythology, historical events, and scenes from everyday life. These stone reliefs decorate a series of walls that surround the central mountain-shaped temple. Since there are no inscriptions identifying the scenes carved into the walls, scholars do not always agree on what they represent. Among the many subjects depicted are naval battles, land battles with soldiers armed with crossbows and catapults, and a marching army with musicians and officers mounted on elephants. Palace scenes depict princesses, servants, feasts, and people engaged in conversations. A scene of royal entertainment shows athletes, jugglers, and acrobats. Other images include ascetics sitting in a forest and a procession of animals. Equally interesting are depictions of ordinary life, with men weighing goods in markets, people cooking outdoors, women tending to children, people watching a cockfight, and fishermen fishing in their boats.

QUESTIONS FOR ANALYSIS

1. Find the boat. What do the people on it seem to be doing? What fish and animals do you see in the picture? Can you find the alligator eating a fish?
2. What do the boats and fish in the relief suggest about the significance of the sea to life in Southeast Asia?
3. Why would a ruler devote so many resources to decorating the walls of a temple? Why include scenes like this one?

The Srivijayan Maritime Trade Empire

Far different from these land-based states was the maritime empire of **Srivijaya** (SCHREE-vuh-jie-uh), based on the island of Sumatra in modern Indonesia. From about 500 on, it held the important Strait of Malacca, through which most of the sea traffic between China and India passed. This state, held together as much by alliances as by direct rule, was in many ways like the Gupta state of the same period in India, securing its prominence and binding its vassals and allies through its splendor and the promise of riches through trade.

Bronze Weaving Woman Found in the Indonesian island of Flores and probably dating to the sixth century, this 10-inch-tall bronze statue portrays a woman who is nursing an infant and at the same time weaving a length of cloth using a foot-braced, body-tension loom. Notice also her large earrings, necklace, and plaited hair.

Much as the Korean and Japanese rulers adopted Chinese models (see “The East Asian Cultural Sphere” in Chapter 7), the Srivijayan rulers drew on Indian traditions to justify their rule and organize their state. The Sanskrit writing system was used for government documents, and Indians were often employed as priests, scribes, and administrators. Indian mythology took hold, as did Indian architecture and sculpture. Kings and their courts, the first to embrace Indian culture, consciously spread it to their subjects.

After several centuries of prosperity, Srivijaya suffered a stunning blow in 1025. The Chola state in south India launched a large naval raid and captured the Srivijayan king and capital. Unable to hold their gains, the Indians retreated, but the Srivijayan Empire never regained its vigor.

During the era of the Srivijayan kingdom, other kingdoms flourished as well in island Southeast Asia. Borobudur, the magnificent Buddhist temple complex, was begun under patronage of Javan rulers around 780. This stone monument depicts the ten tiers of Buddhist cosmology. When pilgrims made the three-mile-long winding ascent, they passed numerous sculpted reliefs depicting the journey from ignorance to enlightenment.

Buddhism became progressively more dominant in Southeast Asia after 800. Mahayana Buddhism became important in Srivijaya and Vietnam, but Theravada Buddhism, closer to the original Buddhism of early India, became the dominant form in the rest of mainland Southeast Asia. Buddhist missionaries from India and Sri Lanka played a prominent role in these developments. Local converts continued the process by making pilgrimages to India and Sri Lanka to worship and to observe Indian life for themselves.

The Spread of Indian Culture in Comparative Perspective

The social, cultural, and political systems developed in India, China, and Rome all had enormous impact on neighboring peoples whose cultures were originally not as technologically advanced. Some of the mechanisms for cultural spread were similar in all three cases, but differences were important as well.

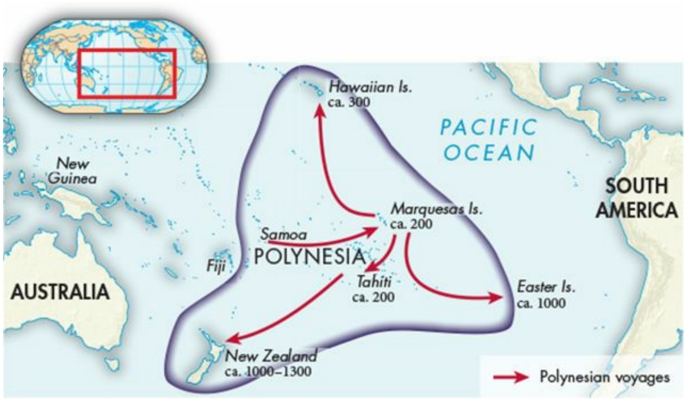
In the case of Rome and both Han and Tang China, strong states directly ruled outlying regions, bringing their civilizations with them.

India’s states, even its largest empires, such as the Mauryan and Gupta, did not have comparable bureaucratic reach. The expansion of Indian culture into Southeast Asia thus came not from conquest and the extension of direct political control but from the extension of trading networks, with missionaries following along. This made it closer to the way Japan adopted features of Chinese culture, often through the intermediary of Korea. In both cases, the cultural exchange was largely voluntary.

The Settlement of the Pacific Islands

Through most of Eurasia, societies became progressively less isolated over time. But in 1400 there still remained many isolated societies, especially in the islands east of modern Indonesia. As discussed in Chapter 1, *Homo sapiens* began settling the western Pacific Islands very early, reaching Australia by 50,000 years ago and New Guinea by 35,000 years ago. The process did not stop there, however. The ancient Austronesians (speakers of Austronesian languages) were skilled mariners who settled numerous islands of the Pacific in subsequent centuries, generally following the coasts. Their descendants, the Polynesians, learned how to sail into the open ocean with only the stars, currents, wind patterns, paths of birds, and perhaps paths of whales and dolphins to help them navigate. They reached Tahiti and the Marquesas Islands in the central Pacific by about 200 C.E.

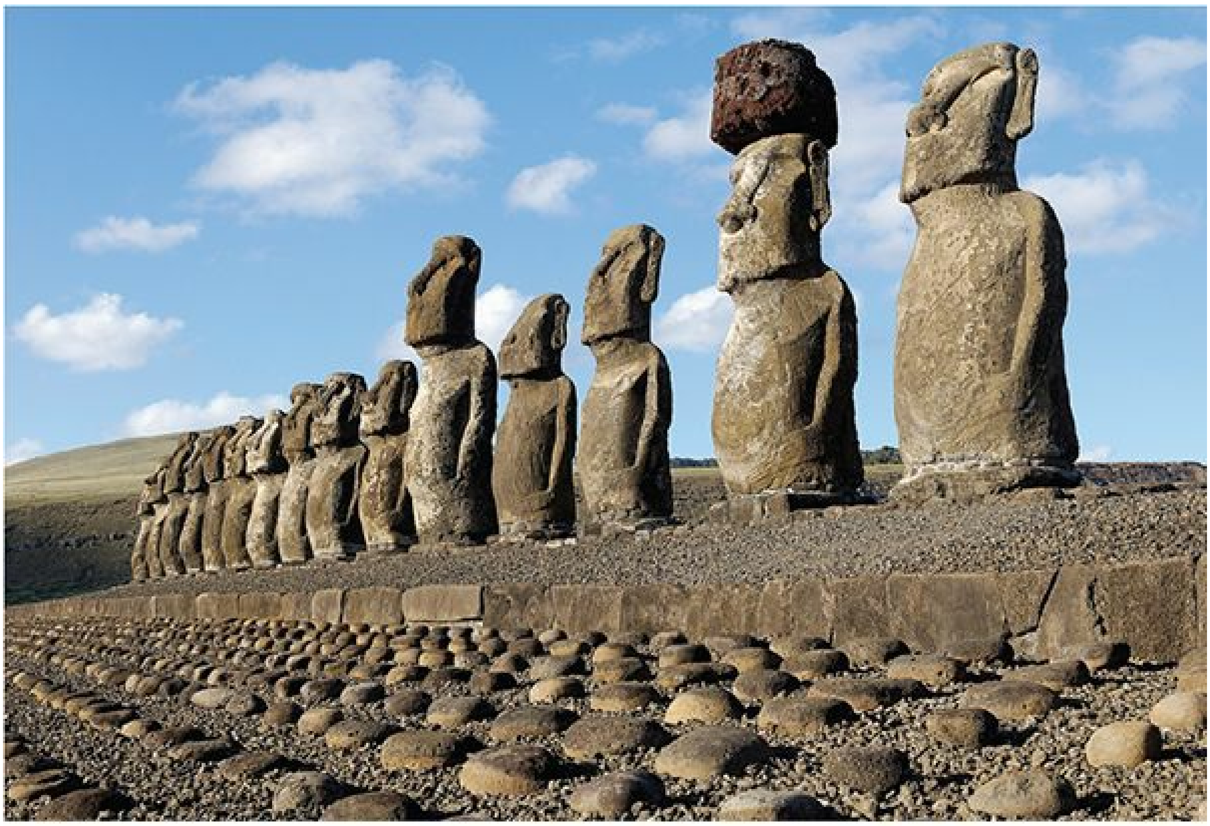
After reaching the central Pacific, Polynesians continued to fan out, in some cases traveling a thousand or more miles away. They reached the Hawaiian Islands in about 300 C.E., Easter Island in perhaps 1000, and New Zealand not until about 1000–1300. There even were groups who sailed west, eventually settling in Madagascar between 200 and 500.



Wiesner-Hanks et al., *A History of World Societies*, 11e, © 2018 Bedford/St. Martin’s

Settlement of the Pacific Islands

In the more remote islands, such as Hawai‘i, Easter Island, and New Zealand, the societies that developed were limited by the small range of domesticated plants and animals that the settlers brought with them and those that were indigenous to the place. Easter Island is perhaps the most extreme case. Only 15 miles wide at its widest point (only 63 square miles in total area), it is 1,300 miles from the nearest inhabited island (Pitcairn) and 2,240 miles from the coast of South America. At some point there was communication with South America, as sweet potatoes originally from there made their way to Easter Island. The community that developed on the island raised chickens and cultivated sweet potatoes, taro, and sugarcane. The population is thought to have reached about fifteen thousand at Easter Island's most prosperous period, which began about 1200 C.E. and lasted a couple of centuries. It was then that its people devoted remarkable efforts to fashioning and erecting the large stone statues that still dot the island.



Jean-Pierre De Mann/Robert Harding World Imagery

Easter Island Statues Archaeologists have excavated and restored many of Easter Island's huge statues, which display remarkable stylistic consistency, with the heads disproportionately large and the legs not visible.

What led the residents of such a small island to erect more than eight hundred statues, most weighing around ten tons and standing twenty to seventy feet tall? One common theory is that they were central to the islanders' religion and that rival clans competed with each other to erect the most impressive statues. The effort they had to expend to carve them with stone tools, move them to the chosen site, and erect them would have been formidable.

After its heyday, Easter Island suffered severe environmental stress with the decline of its forests. The islanders could not make boats to fish in the ocean, and bird colonies shrank as nesting areas decreased, also reducing the food supply. Scholars still disagree on how much weight to give the many different elements that contributed to the decline in the prosperity of Easter Island from the age when the statues were erected.

Certainly, early settlers of an island could have a drastic impact on its ecology. When Polynesians first reached New Zealand, they found large birds up to ten feet tall. They hunted them so eagerly that within a century the birds had all but disappeared. Hunting seals and sea lions also led to their rapid depletion. But the islands of New Zealand were much larger than Easter Island, and in time the Maori (the indigenous people of New Zealand) found more sustainable ways to feed themselves, depending more and more on agriculture.

Chapter Summary

The pastoral societies that stretched across Eurasia had the great military advantage of being able to raise horses in large numbers and support themselves from their flocks of sheep, goats, and other animals. Nomadic pastoralists generally were organized on the basis of clans and tribes that selected chiefs for their military talent. Much of the time these tribes fought with each other, but several times in history leaders formed larger confederations capable of coordinated attacks on cities and towns.

From the fifth to the twelfth centuries the most successful nomadic groups on the Eurasian steppes were Turks who gained ascendancy in many of the societies from the Middle East to northern India. In the early thirteenth century, through his charismatic leadership and military genius, the Mongol leader Chinggis Khan conquered much of Eurasia.

After Chinggis's death, the empire was divided into four khanates ruled by four of Chinggis's descendants. For a century the Mongol Empire fostered unprecedented East-West contact. The Mongols encouraged trade and often moved craftsmen and other specialists from one place to another. The Mongols were tolerant of other religions. As more Europeans made their way east, Chinese inventions such as printing and the compass made their way west. Europe especially benefited from the spread of technical and scientific ideas. Diseases also spread, including the Black Death.

India was invaded by the Mongols but not conquered. After the fall of the Gupta Empire in about 480, India was for the next millennium ruled by small kingdoms, which allowed regional cultures to flourish. For several centuries Muslim Turks ruled north India from Delhi. Over time Islam gained adherents throughout South Asia. Hinduism continued to flourish, but Buddhism declined.

Throughout the medieval period India continued to be the center of active seaborne trade, and this trade helped carry Indian ideas and practices to Southeast Asia. Local rulers used experts from India to establish strong states, such as the Khmer kingdom and the Srivijayan kingdom. Buddhism became the dominant religion throughout the region. The Pacific Islands east of Indonesia remained isolated culturally for centuries.

CONNECTIONS

The societies of Eurasia became progressively more connected to each other during the centuries discussed in this chapter. One element promoting connection was the military superiority of the nomadic warriors of the steppe: first the Turks, then the Mongols, who conquered many of the settled civilizations near them. Invading Turks brought Islam to India. Connection between societies also came from maritime trade across the Indian Ocean and East Asia. Maritime trade was a key element in the spread of Indian culture to both the mainland and insular Southeast Asia. Other elements connecting these societies included Sanskrit as a language of administration and missionaries who brought both Hinduism and Buddhism far beyond their homelands. Some societies did remain isolated, probably none more than the remote islands of the Pacific, such as Hawaiʻi, Easter Island, and New Zealand. East Asia was a key element in both the empires created by nomadic horsemen and the South Asian maritime trading networks. As discussed in Chapter 13, before East Asia had to cope with the rise of the Mongols, it experienced one of its most prosperous periods, during which China, Korea, and Japan became more distinct culturally. China's economy boomed during the Song Dynasty, and the scholar-official class, defined through the civil service examination system, came more and more to dominate culture. In Korea and Japan, by contrast, aristocrats and military men gained ascendancy. Although China, Korea, and Japan all drew on both Confucian and Buddhist teachings, they ended up with elites as distinct as the Chinese scholar-official, the Korean aristocrat, and the Japanese samurai.

Review the Main Ideas

Answer the focus questions from each section of the chapter.

1. What aspects of nomadic life gave the nomads of Central Asia military advantages over nearby settled civilizations? (p. 320)
2. How did Chinggis Khan and his successors conquer much of Eurasia, and how did the Mongol conquests change the regions affected? (p. 323)
3. How did the Mongol conquests facilitate the spread of ideas, religions, inventions, and diseases? (p. 329)
4. What was the result of India’s encounters with Turks, Mongols, and Islam? (p. 333)
5. How did states develop along the maritime trade routes of Southeast Asia and beyond? (p. 338)

Make Comparisons and Connections

Analyze the larger developments and continuities within and across chapters.

1. How do the states established by Arabs in the seventh and eighth centuries (Chapter 9) compare to those established by Turks in the tenth and eleventh centuries?
2. What similarities and differences are there in the military feats of Alexander the Great (Chapter 5) and Chinggis Khan?
3. How does the slow spread of Buddhism and Indian culture to Southeast Asia

compare to the slow spread of Christianity and Roman culture in Europe (Chapters 6 and 8)?

States and Cultures in East Asia

800–1400

Song Chancellor

Known for his stern demeanor, Sima Guang (1019–1086) was an eminent historian and a leading official.

During the six centuries between 800 and 1400, East Asia was the most advanced region of the world. For several centuries the Chinese economy had grown spectacularly, and China’s methods of production were highly advanced in fields as diverse as rice cultivation, the production of iron and steel, and the printing of books. Philosophy and the arts all flourished. China’s system of government was also advanced for its time. In the Song period, the principle that the government should be in the hands of highly educated scholar-officials, selected through competitive written civil service examinations, became well established. Song China’s great wealth and sophisticated government did not give it military advantage, however, and in this period China had to pay tribute to militarily more powerful northern neighbors, the Khitans (key-tuns), the Jurchens, and finally the Mongols, who conquered all of China in 1279.

During the previous millennium, basic elements of Chinese culture had spread beyond China’s borders, creating the East Asian cultural sphere based on the use of Chinese as the language of civilization. Beginning around 800, however, the pendulum shifted toward cultural differentiation as Japan, Korea, and China developed in distinctive ways. In both Korea and Japan, for several centuries court aristocrats were dominant both politically and culturally, and then aristocrats lost out to military men with power in the countryside. By 1200 Japan was dominated by warriors — known as samurai — whose ethos was quite unlike that of China’s educated elite. In both Korea and Japan, Buddhism retained a very strong hold, one of the ties that continued to link the countries of East Asia. In addition, China and Korea both had to deal with the same menacing neighbors to the north. Even Japan had to mobilize its resources to fend off two seaborne Mongol attacks.

The Medieval Chinese Economic Revolution, 800–1100

What made possible the expansion of the Chinese economy, and what were the outcomes of this economic growth?

Chinese historians traditionally viewed dynasties as following a standard cyclical pattern. Founders were vigorous men able to recruit capable followers to serve as officials and generals. Externally they would extend China’s borders; internally they would bring peace. Over time, however, emperors born in the palace would get used to luxury and lack the founders’ strength and wisdom. Families with wealth or political power would find ways to avoid taxes, forcing the government to impose heavier taxes on the poor. As a result, impoverished peasants would flee, the morale of those in the government and armies would decline, and the dynasty would find itself able neither to maintain internal peace nor to defend its borders.

Viewed in terms of this theory of the **dynastic cycle**, by 800 the Tang Dynasty was in decline (see “The Chinese Empire Re-created: Sui [581–618] and Tang [618–907]” in Chapter 7). It had ruled China for nearly two centuries, and its high point was in the past. A massive rebellion had wracked it in the mid-eighth century, and the Uighur Turks and Tibetans were menacing its borders. Many of the centralizing features of the government had been abandoned, with power falling more and more to regional military governors.

dynastic cycle The theory that Chinese dynasties go through a predictable cycle from early vigor and growth to subsequent decline as administrators become lax and the well-off find ways to avoid paying taxes, cutting state revenues.

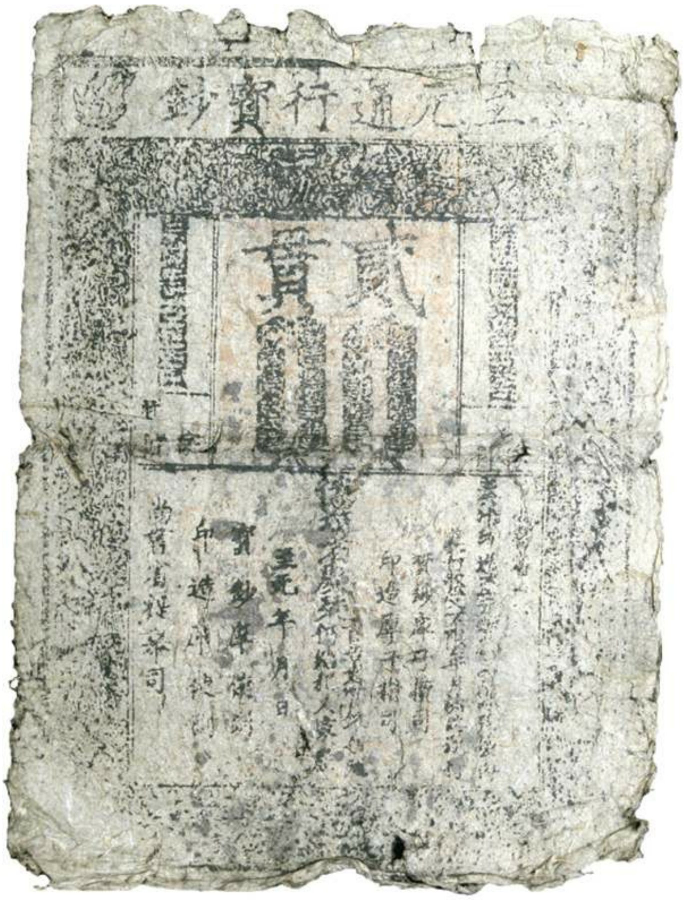
Historically, Chinese political theorists always assumed that a strong, centralized government was better than a weak one or than political division, but, if anything, the Tang toward the end of its dynastic cycle seems to have been both intellectually and economically more vibrant than the early Tang had been. Less control from the central government seems to have stimulated trade and economic growth.

A government census conducted in 742 shows that China’s population was still approximately 50 million, very close to what it had been in 2 C.E.

Over the next three centuries, with the expansion of wet-field rice cultivation in central and south China, the country’s food supply steadily increased, and so did its population, which had reached 100 million by 1100. China’s population probably already exceeded that of all the Islamic countries of the time or that of all the countries of Europe put together. Urbanization increased, and both literature and the arts thrived. (See “Global Viewpoints: Painters of Uncanny Skill in China and Rome,” at right.)

Agricultural prosperity and denser settlement patterns aided commercialization of the economy. Farmers in Song China no longer merely aimed at self-sufficiency. Instead, farmers sold their surpluses and used their profits to buy charcoal, tea, oil, and wine. In many places farmers specialized in commercial crops, such as sugar, oranges, cotton, silk, and tea. The need to transport the products of interregional trade stimulated the inland and coastal shipping industries.

As marketing increased, demand for money grew enormously, leading eventually to the creation of the world’s first paper money. To avoid the weight and bulk of coins for large transactions, local merchants in late Tang times started trading receipts from deposit shops where they had left money or goods. The early Song authorities awarded a small set of these shops a monopoly on the issuing of these certificates of deposit, and in the 1120s the government took over the system, producing the world’s first government-issued paper money.



National Museum of Chinese History, Beijing, China/Ancient Art & Architecture Collection, Ltd./Bridgeman Images

Chinese Paper Money Chinese paper currency indicated the unit of currency and the date and place of issue. The Mongols continued the use of paper money, as this note from the Mongol period attests.

With the intensification of trade, merchants became progressively more specialized and organized. They set up partnerships and joint stock companies, with a separation of owners (shareholders) and managers. In the large cities merchants were organized into guilds according to the type of product sold, and they arranged sales from wholesalers to shop owners and periodically set prices.

Foreign trade also flourished in the Song period. Chinese ships began to displace Indian and Arab merchants in the South Seas, and ship design was improved in several ways. Watertight bulkheads improved buoyancy and protected cargo. Stern-mounted rudders improved steering. Some of the ships were powered by both oars and sails and were large enough to hold several hundred men.

Also important to oceangoing travel was the perfection of the **compass**. The ability of a magnetic needle to point north had been known for some time, but in Song times the needle was reduced in size and attached to a fixed stem (rather than floated in water). In some instances it was put in a small protective case with a glass top, making it suitable for sea travel. The first reports of a compass used in this way date to 1119.

compass A tool for identifying north using a magnetic needle; it was made useful for sea navigation in Song times when placed in a protective case.

The Song also witnessed many advances in industrial techniques. Heavy industry, especially iron, grew astoundingly. With advances in metallurgy, iron production reached around 125,000 tons per year in 1078, a sixfold increase over the output in 800. Much of the iron was used for military purposes. Mass-production methods were used to make iron armor in small, medium, and large sizes. High-quality steel for swords was made through high-temperature metallurgy. The needs of the army also brought Chinese engineers to experiment with the use of gunpowder. In the twelfth-century wars against the Jurchens, those defending a besieged city used gunpowder to propel projectiles at the enemy.

Economic expansion fueled the growth of cities. Dozens of cities had 50,000 or more residents, and quite a few had more than 100,000, very large populations compared to other places in the world at the time. China’s two successive capitals, Kaifeng (kigh-fuhng) and Hangzhou (hahng-joh), each had an estimated 1 million residents. Marco Polo described Hangzhou as the finest and most splendid city in the world. He reported that it had ten marketplaces, each half a mile long, where 40,000 to 50,000 people would shop on any given day. There were also bathhouses; permanent shops selling items such as spices, drugs, and pearls; and innumerable courtesans, whom Marco Polo described as “adorned in much finery, highly perfumed, occupying well-furnished houses, and attended by many female domestics.”[1]

The medieval economic revolution shifted the economic center of China south to the Yangzi River drainage area. This area had many advantages over the north China plain. Rice, which grew in the south, provides more calories per unit of land and therefore allows denser settlement. The milder temperatures often allowed two crops to be grown on the same plot of land, first a summer crop of rice and then a winter crop of wheat or vegetables. The abundance of rivers and streams facilitated shipping, which reduced the cost of transportation and thus made regional specialization economically more feasible.

Ordinary people benefited from the Song economic revolution in many ways. There were more opportunities for the sons of farmers to leave agriculture and find work in cities. Those who stayed in agriculture had a better chance of improving their situations by taking up sideline production of wine, charcoal, paper, or textiles. Energetic farmers who grew cash crops such as sugar, tea, mulberry leaves (for silk), and cotton (recently introduced from India) could grow rich. Greater interregional trade led to the availability of more goods at the rural markets held every five or ten days.

Transplanting Rice To get the maximum yield per plot and to make it possible to grow two crops in the same field, Chinese farmers grew rice seedlings in a seedbed and then, when a field was free, transplanted the seedlings into the flooded field. Because the Song government wanted to promote up-to-date agricultural technology, in the twelfth century it commissioned a set of twelve illustrations of the steps to be followed. This painting comes from a later version of those illustrations.

Of course, not everyone grew rich. Poor farmers who fell into debt had to sell their land, and if they still owed money they could be forced to sell their daughters as maids, concubines, or prostitutes. The prosperity of the cities created a huge demand for women to serve the rich in these ways, and Song sources mention that criminals would kidnap girls and women to sell in distant cities at huge profits.

GLOBAL VIEWPOINTS

Painters of Uncanny Skill in China and Rome

Chinese art critics often expressed astonishment at the ability of exceptional painters to evoke an emotional reaction in viewers. A good example is the account of the eighth-century painter Wu Daozi, written by a ninth-century critic, Zhu Jingxuan, in his *Famous Painters of the Tang Dynasty*. It can be compared to remarks on painters by the Roman man of letters Pliny the Elder (23–79 C.E.).

Zhu Jingxuan on the Painter Wu Daozi

■ A poor orphan, Wu Daozi was so talented by nature that even before he was twenty he had mastered all the subtleties of painting. When he was in Luoyang, the emperor heard of his fame and summoned him to court….

The General Pei Min sent a gift of gold and silk to Wu Daozi and asked him to paint the walls of the Paradise Buddhist monastery. Wu Daozi returned the gold and silk with a note saying, “I have long heard of General Pei. If he would do a sword dance for me, that would be reward enough, and the sight of such vigor will inspire my brush.” So the general, even though in mourning, did the sword dance for Wu Daozi, and when the dance was finished Wu made his brush fly with such strength that the painting was done in no time, as though some god was helping him. Wu Daozi also did the laying on of the colors himself. One can still see the painting in the western corridor of the temple….

During the Tianbao period (742–755), the emperor Xuanzong suddenly longed for the Jialing River on the road to Sichuan. So he allowed Wu Daozi the use of post horses and ordered him to go there and make sketches of the scenery. On his return, in response to the emperor’s query, Wu said, “I have not brought back a single sketch, but everything is recorded in my mind.” He was commanded to depict it on the walls of Great Accord Hall. He painted a landscape of more than 300 *li*, finishing it all in a single day…. He also painted five dragons in the Inner Hall whose scales seemed to move. Whenever it was about to rain, mist would emanate from them….

I also heard from an old monk of Scenic Clouds Monastery that when Master Wu painted a Hell scene at the temple, butchers and fishmongers who saw it became so frightened by it that they decided to change their profession and turn to doing good works.

Pliny on the Painters Arellius and Lepidus

■ Not long before the time of the god Augustus, Arellius had earned distinction at Rome, save for the sacrilege by which he notoriously degraded his art. Always desirous of flattering some woman or other with whom he chanced to be in love, he painted goddesses in the person of his mistresses, of whom his paintings are a mere catalogue. The painter Famulus also lived not long ago; he was grave and severe in his person, while his painting was rich and vivid. He painted an Athena whose eyes are turned to the spectator from whatever side he may be looking….

While on the subject of painting I must not omit the well-known story of Lepidus. Once during his triumvirate he had been escorted by the magistrates of a certain town to a lodging in the middle of a wood, and on the next morning complained with threats that the singing of the birds prevented him from sleeping. They painted a snake on an immense strip of parchment and stretched it all round the grove. We are told that by this means they terrified the birds into silence and that this has ever since been a recognized device for quieting them.

QUESTIONS FOR ANALYSIS

1. What assumptions, if any, did the Chinese and Roman authors share about artistic creativity?
2. In what ways did painters gain fame in these two societies?

China During the Song and Yuan Dynasties, 960–1368

How did the civil service examinations and the scholar-official class shape Chinese society and culture, and what impact did the Mongol conquest have on them?

In the tenth century Tang China broke up into separate contending states, some of which had non-Chinese rulers. The two states that proved to be long lasting were the Song, which came to control almost all of China proper south of the Great Wall, and the Liao (leeow), whose ruling house was Khitan and which held the territory of modern Beijing and areas north (Map 13.1). Although the Song Dynasty had a much larger population, the Liao was militarily the stronger of the two. In the early twelfth century the Liao state was defeated by the Jurchens, another non-Chinese people, who founded the Jin Dynasty and went on to conquer most of north China in 1127, leaving Song to control only the south. After a century the Jurchens' Jin Dynasty was defeated by the Mongols, who extended their Yuan Dynasty to control all of China by 1276.

Mapping the Past

MAP 13.1 East Asia in 1000 and 1200 The Song empire did not extend as far as its predecessor, the Tang, and faced powerful rivals to the north — the Liao Dynasty of the

Khitans and the Xia Dynasty of the Tanguts. Koryŏ Korea maintained regular contact with Song China, but Japan, by the late Heian period, was no longer deeply involved with the mainland. By 1200 military families dominated both Korea and Japan, but the borders were little changed. On the mainland the Liao Dynasty had been overthrown by the Jurchens' Jin Dynasty, which also seized the northern third of the Song empire. Because the Song relocated its capital to Hangzhou in the south, this period is called the Southern Song period.

ANALYZING THE MAP What were the countries of East Asia in 1000? What were the major differences in 1200?

CONNECTIONS What connections do you see between the length of their northern borders and the histories of China, Korea, and Japan?

The Song Dynasty

The founder of the Song Dynasty, Taizu (r. 960–976), was a general whose troops elevated him to emperor (in an act somewhat reminiscent of Roman practice). To make sure that such an act could not happen in the future, Taizu retired or rotated his generals and assigned civil officials to supervise them. In time these civil bureaucrats came to dominate every aspect of Song government and society. The civil service examination system established during the Sui Dynasty (see "The Chinese Empire Re-created: Sui [581–618] and Tang [618–907]" in Chapter 7) was greatly expanded to provide the dynasty with a constant flow of men trained in the Confucian classics.

Curbing the generals' power ended warlordism but did not solve the military problem of defending against the nomadic Khitans' Liao Dynasty to the north. After several attempts to push the Liao back beyond the Great Wall, the Song concluded a peace treaty with them. The Song agreed to make huge annual payments of gold and silk to the Khitans, in a sense paying them not to invade. Even so, the Song rulers had to maintain a standing army of more than a million men. By the middle of the eleventh century military expenses consumed half the government's revenues. Song had the industrial base to produce swords, armor, and arrowheads in huge quantities, but had difficulty maintaining enough horses and well-trained horsemen. Even though China was the economic powerhouse of the region, with by far the largest population, the horse was a major weapon of war in this period, and it was not easy to convert wealth to military advantage.

In the early twelfth century the military situation rapidly worsened when the Khitan state was destroyed by another tribal confederation led by the Jurchens, who quickly realized how easy it would be to defeat the Song. After setting siege to the Song capital in 1126, they captured the emperor and former emperor and took them and the entire court into captivity. Song forces rallied around one of the emperor's sons who had escaped capture, and this prince re-established a Song court in the south at Hangzhou (see Map 13.1). This Southern Song Dynasty controlled only about two-thirds of the former Song territories, but the social, cultural, and intellectual life there remained vibrant until the Song fell to the Mongols in 1279.

The Scholar-Officials and Neo-Confucianism

The Song period saw the full flowering of one of the most distinctive features of Chinese civilization, the **scholar-official class** certified through highly competitive civil service examinations. This elite was both broader and better educated than the elites of earlier periods in Chinese history. Once the **examination system** was fully developed, aristocratic habits and prejudices largely disappeared.

scholar-official class Chinese educated elite that included both scholars and officials. The officials had usually gained office by passing the highly competitive civil service examination.

examination system A system of selecting officials in imperial China based on competitive written examinations.

To prepare for the examinations, men had to memorize the classics in order to be able to recognize even the most obscure passages. They also had to master specific forms of composition, including poetry, and be ready to discuss policy issues, citing appropriate historical examples. Those who became officials this way had usually tried the exams several times and were on average a little over thirty years of age when they succeeded.

The invention of printing should be given some credit for the trend toward a better-educated elite. Tang craftsmen developed the art of carving words and pictures into wooden blocks, inking the blocks, and pressing paper onto them. Each block held an entire page of text. Such whole-page blocks were used for printing as early as the middle of the ninth century, and in the eleventh century **movable type** (one piece of type for each character) was invented, but it was rarely used because whole-block printing was cheaper. In China, as in Europe a couple of centuries later, the introduction of printing dramatically lowered the price of books, thus aiding the spread of literacy.

movable type A system of printing in which one piece of type is used for each unique character.

Among the upper class the availability of cheaper books enabled scholars to amass their own libraries. Song publishers printed the classics of Chinese literature in huge editions. Works on philosophy, science, and medicine were also avidly consumed, as were Buddhist texts. Han and Tang poetry and historical works became the models for Song writers. One popular literary innovation was the encyclopedia, which first appeared in the Song period.

The life of the educated man involved more than study for the civil service examinations and service in office. Many took to refined pursuits such as collecting antiques or old books and practicing the arts — especially poetry writing, calligraphy, and painting. (See “Analyzing the Evidence: Ma Yuan’s Painting *On a Mountain Path in Spring*, at right.)

The new scholar-official elite produced some extraordinary men able to hold high court offices while pursuing diverse intellectual interests. (See “Individuals in Society: Shen Gua,” at right.) Ouyang Xiu spared time in his busy official career to write love songs, histories, and the first analytical catalogue of rubbings of ancient stone and bronze inscriptions. Sima Guang, besides serving as chancellor, wrote a narrative history of China from the Warring States Period (403–221 B.C.E.) to the founding of the Song Dynasty. Su Shi wrote more than twenty-seven hundred poems and eight hundred letters while active in opposition politics. He was also an esteemed painter, calligrapher, and theorist of the arts. Su Song, another high official, constructed an eighty-foot-tall mechanical clock that told not only the time of day but also the day of the month, the phase of the moon, and the position of certain stars and planets in the sky. As in Renaissance Europe a couple of centuries later (see Chapter 15), gifted men made advances in a wide range of fields.

Besides politics, scholars also debated issues in ethics and metaphysics. For several centuries Buddhism had been more vital than Confucianism. Beginning in the late Tang period, Confucian teachers began claiming that the teachings of the Confucian sages contained all the wisdom one needed and that a true Confucian would reject Buddhist teachings. During the eleventh century many Confucian teachers urged students to set their sights not on exam success but on the higher goals of attaining the wisdom of the sages. Metaphysical theories about the workings of the cosmos in terms of *li* (principle) and *qi* (vital energy) were developed in response to the challenge of the sophisticated metaphysics of

Buddhism.

Neo-Confucianism, as this movement is generally termed, was more fully developed in the twelfth century by the immensely learned Zhu Xi (joo shee) (1130–1200). Besides serving in office, he wrote, compiled, or edited almost a hundred books; corresponded with dozens of other scholars; and still regularly taught groups of disciples, many of whom stayed with him for years at a time. Although he was treated as a political threat during his lifetime, within decades of his death his writings came to be considered orthodox, and in subsequent centuries candidates for the examinations had to be familiar with his commentaries on the classics.

Neo-Confucianism The revival of Confucian thinking that began in the eleventh century, characterized by the goal of attaining the wisdom of the sages, not exam success.

ANALYZING THE EVIDENCE

Ma Yuan’s Painting *On a Mountain Path in Spring*

Because competition for the civil service examinations was so fierce, the great majority of those who devoted years to memorizing the classics and preparing for the exams never became officials. But they found many other agreeable ways to fill their time, such as writing poetry, practicing calligraphy, and viewing each other’s treasures such as old paintings or calligraphies. A large share of the social life of upper-class men was centered on these refined pastimes: they gathered to compose or criticize poetry, view each other’s art treasures, and patronize young talents. Still, they often imagined themselves as solitary figures, walking in the mountains and drawing inspiration from the beauty of the landscape. Paintings of scholars in landscapes became quite common.

It was in fact during the Song period that the art of landscape painting was perfected. In earlier periods, painters had added background to images of people, birds, and buildings, but in Song times they often made the landscape itself the central element in the composition, developing new ways to show depth. Some landscape paintings focused on a large central mountain, but more intimate scenes came to be preferred in the later half of the Song Dynasty (the Southern Song period). Birds and flowers were also a popular subject for paintings. Song painters also developed ways to depict a scene entirely in shades of ink, rather than add colors. In addition, the image was sometimes coupled with a poem, which could be provided by the painter or by someone else, such as the person who requested the painting. In the Southern Song period, painters at court frequently worked closely with members of the court, including empresses and other consorts, who supplied the calligraphy for paintings.

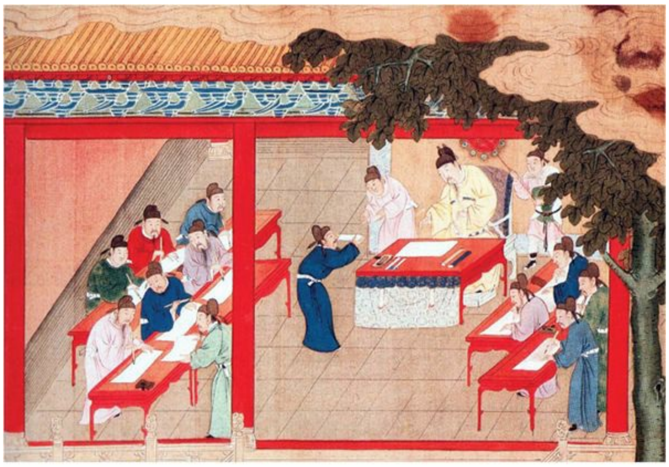
In this painting, the court painter Ma Yuan (ca. 1190–1225) depicts a scholar on an outing accompanied by his boy servant carrying a lute. The scholar gazes into the mist, his eyes attracted by a bird in flight. The poetic couplet was inscribed by Emperor Ningzong (r. 1194–1124), at whose court Ma Yuan served. It reads: “Brushed by his sleeves, wild flowers dance in the wind. / Fleeing from him, hidden birds cut short their songs.”

QUESTIONS FOR ANALYSIS

1. Find the key elements in this picture: the scholar, the servant boy, the bird, the willow tree. Are these elements skillfully conveyed? Are there other elements in the painting that you find hard to read?
2. What does the poetic couplet add to this painting? Do you view the painting differently knowing that the poem was supplied by the emperor rather than the painter?
3. If the painter had added more colors, how would this have changed the painting? Would it be better or worse?

INDIVIDUALS IN SOCIETY

Shen Gua



Pictures from History/Bridgeman Images

Depicted here are officials reading and discussing examination papers.

IN THE ELEVENTH CENTURY IT WAS NOT RARE FOR CHINESE men of letters to have broad interests, but few could compare to Shen Gua (1031–1095), a man who tried his hand at everything from mathematics, geography, economics, engineering, medicine, divination, and archaeology to military strategy and diplomacy.

Shen Gua's father was an official, and Shen Gua often accompanied him on his assignments. In 1063 he passed the civil service examinations, and in 1066 he received a post in the capital. He eventually held high astronomical, ritual, and financial posts and became involved in waterworks and the construction of defense walls. He was sent as an envoy to the Khitans in 1075 to try to settle a boundary dispute. When a military campaign that he advised failed in 1082, he was demoted, and he later retired to write.

It is from his book of miscellaneous notes that we know the breadth of his interests. In one note Shen describes how, on assignment to inspect the frontier, he made a relief map of wood and glue-soaked sawdust to show the mountains, roads, rivers, and passes. The emperor was so impressed when he saw it that he ordered all the border prefectures to make relief maps. Elsewhere Shen describes the use of petroleum and explains how to make movable type from clay. Shen Gua often applied a mathematical approach to issues that his contemporaries did not think of in those terms. He once computed the total number of possible situations on a Go board, and another time he calculated the longest possible military campaign given the limits of human carriers, who had to carry their own food as well as food for the soldiers.

Shen Gua is especially known for his scientific explanations. He explained the deflection of the compass from due south. He identified petrified bamboo and from its existence argued that the region where it was found must have been much warmer and more humid in ancient times. He argued against the theory that tides are caused by the rising and setting of the sun, demonstrating that they correlate with the cycles of the moon. He proposed switching from a lunar calendar to a solar one of 365 days, saying that even though his contemporaries would reject his idea, “surely in the future some will adopt my idea.” To convince his readers that the sun and the moon were spherical, not flat, he suggested that they cover a ball with fine powder on one side and then look at it obliquely. The powder was the part of the moon illuminated by the sun, and as the viewer looked at it obliquely, the white part would be crescent shaped, like a waxing moon. Shen Gua, however, did not realize that the sun and moon had entirely different orbits, and he explained why they did not collide by positing that both were composed of *qi* (vital energy) and had form but not substance.

Shen Gua also wrote on medicine and criticized his contemporaries for paying more attention to old treatises than to clinical experience. Yet he, too, was sometimes stronger on theory than on observation. In one note he argued that longevity pills could be made from cinnabar. He reasoned that if cinnabar could be transformed in one direction, it ought to be susceptible to transformation in the opposite direction as well. Therefore, since melted cinnabar causes death, solid cinnabar should prevent death.

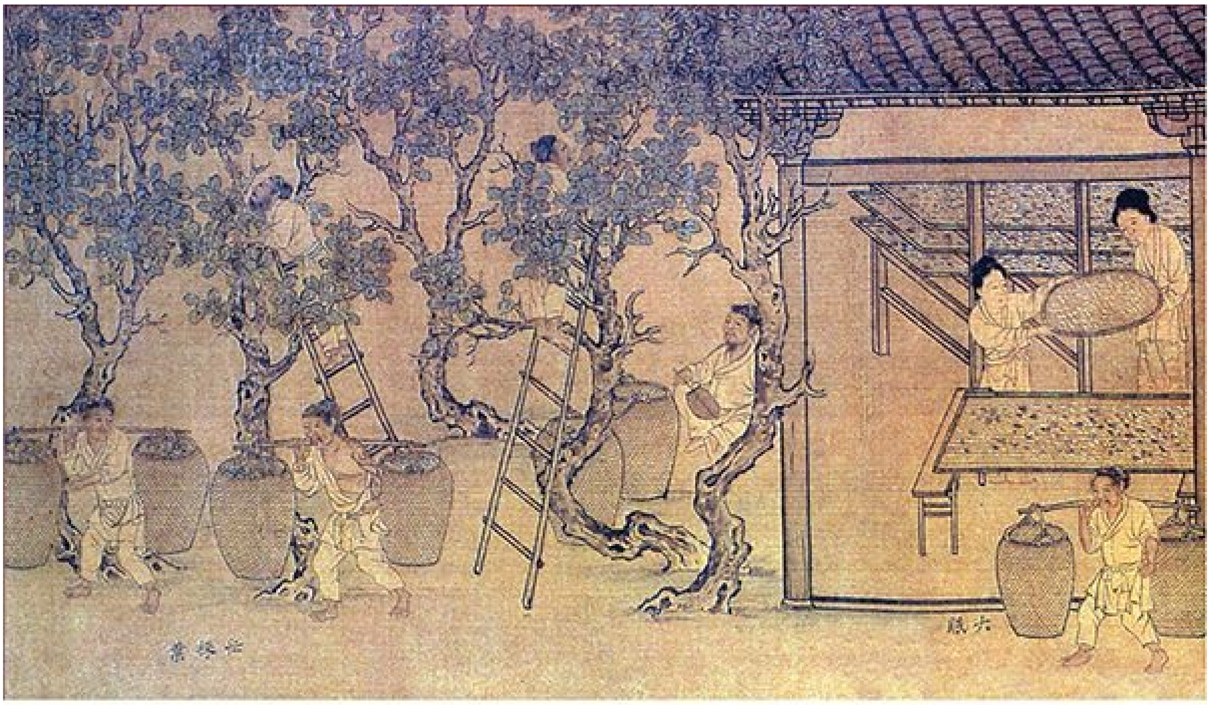
QUESTIONS FOR ANALYSIS

1. In what ways could Shen Gua have used his scientific interests in his work as a government official?
2. How does Shen Gua’s understanding of the natural world compare to that of the early Greeks? (See “The Flowering of Philosophy” in Chapter 5.)

Women’s Lives in Song Times

Thanks to the spread of printing, more books survive from the Song period than from earlier periods, giving us more glimpses of women’s lives. Stories, documents, and legal cases show us widows who ran inns, midwives who delivered babies, pious women who spent their days chanting Buddhist sutras, girls who learned to read with their brothers, farmers’ daughters who made money by weaving mats, childless widows who accused their nephews of stealing their property, and wives who were jealous of the concubines their husbands brought home.

Families who could afford it usually tried to keep their wives and daughters within the walls of the house, rather than let them work in the fields or in shops or inns. At home there was plenty for them to do. Not only was there the work of tending children and preparing meals, but spinning, weaving, and sewing were considered women’s work as well and took a great deal of time. Families that raised silkworms also needed women to do much of the work of coddling the worms and getting them to spin their cocoons. Within the home women generally had considerable say and took an active interest in issues such as the selection of marriage partners for their children.



Pictures from History/Bridgeman Images

Picking Mulberry Leaves and Feeding Silkworms This is one scene in a long scroll depicting the work required for the creation of silk textiles. Here we see men climbing ladders to pick mulberry leaves and women feeding the leaves to the silkworms, so that they will spin cocoons from which strands can be separated and twisted into threads.

Women tended to marry between the ages of sixteen and twenty. Their husbands were, on average, a couple of years older than they were. Marriages were arranged by their parents, who would have either called on a professional matchmaker or turned to a friend or relative for suggestions. Before a wedding took place, written agreements were exchanged, listing the prospective bride's and groom's birth dates, parents, and grandparents; the gifts that would be exchanged; and the dowry the bride would bring.

The young bride's first priority was to try to win over her mother-in-law. One way to do this was to quickly bear a son for the family. Within the patrilineal system, a woman fully secured her position in the family by becoming the mother of one of the men. Every community had older women skilled in midwifery who were called to help when a woman went into labor. If the family was well-to-do, arrangements might be made for a wet nurse to help her take care of the newborn.

Women frequently had four, five, or six children, but likely one or more would die in infancy. If a son reached adulthood and married before the woman herself was widowed, she would be considered fortunate, for she would have always had an adult man who could take care of business for her — first her husband, then her grown son.

A woman with a healthy and prosperous husband faced another challenge in middle age: her husband could bring home a **concubine**. Wives outranked concubines and could give them orders in the house, but a concubine had her own ways of getting back through her hold on the husband. The children born to a concubine were considered just as much children of the family as the wife's children, and if the wife had had only daughters and the concubine had a son, the wife would find herself dependent on the concubine's son in her old age. Moralists insisted that it was wrong for a wife to be jealous of her husband's concubines, but contemporary documents suggest that jealousy was very common.

concubine A woman contracted to a man as a secondary spouse; although subordinate to the wife, her sons were considered legitimate heirs.

Woman Attendant The Song emperors were patrons of a still-extant temple in northern China that enshrined a statue of the “holy mother,” the mother of the founder of the ancient Zhou Dynasty. The forty-two maids who attend her, one of whom is shown here, seem to have been modeled on the palace ladies who attended Song emperors.

Neo-Confucianism is sometimes blamed for a decline in the status of women in Song times, largely because one of the best known of the Neo-Confucian teachers, Cheng Yi, once told a follower that it would be better for a widow to die of starvation than to lose her virtue by remarrying. In later centuries this saying was often quoted to justify pressuring widows, even very young ones, to stay with their husbands' families and not remarry. In Song times, however, widows frequently remarried.

It is true that **foot binding** began during the Song Dynasty, but it was not recommended by Neo-Confucian teachers; rather it was associated with the pleasure quarters and with women's efforts to beautify themselves. In this practice, the feet of girls were bound with long strips of cloth to keep them from growing large and to make the feet narrow and arched. (See "Thinking Like a Historian: When and Why Did Foot Binding Begin?" page 360.)

THINKING LIKE A HISTORIAN

When and Why Did Foot Binding Begin?

Both archaeological and textual evidence indicate that by the end of the Song Dynasty some girls in China were having their feet bound to keep them small. Striking archaeological evidence comes from the grave of Huang Sheng, buried in 1243 at age sixteen. Her feet were bound with a long strip of cloth, and her coffin included shoes measuring from 5 to 5½ inches long, for bound feet. In Song period sources, historians have found casual mentions of foot binding and a couple of discussions of the practice's origins and purpose. Foreign visitors to China began to refer to foot binding in the early 1300s.

1 **Su Shi, poem, ca. 1060–1100.** About twenty-seven hundred poems by the renowned poet Su Shi (1036–1101) survive. One of these seems to refer to the small bound foot of a dancer.

■ Anointed with fragrance, she takes lotus steps;
Though often sad, she steps with swift lightness.
She dances like the wind, leaving no physical trace.
Another stealthily but happily tries on the palace style,
But feels such distress when she tries to walk!
Look at them in the palms of your hands,
So wondrously small that they defy description.

2 **Chen Liang, letter to Zhu Xi, ca. 1180.** Chen Liang (1143–1194) wrote this letter in response to a letter he had received from Zhu Xi (1130–1200). In it Chen Liang's reference to foot binding is metaphorical.

■ My whole life I have been obsessed with predicting what is going on among leading people but now I know that it is impossible. I must not stumble about like a blind person who cannot find his cane.… I am so obstinate that I write letters every day to my juniors. It is just like an ugly woman of thirty or forty who decides to chinch her waist and bind her feet — not only is it laughable, but it is also very painful.

3 **Che Ruoshui, *Jiaoqi ji*, 1274.** Che Ruoshui questioned the morality of binding girls' feet in this short note.

■ No one knows when foot binding began. Little girls not yet four or five years old, who have done nothing wrong, nevertheless are made to suffer unlimited pain to bind [their feet] small. I do not know what purpose this serves.

Zhou Mi, *Elegant Conversations from the Impetuous Hall*, late thirteenth century. Zhou Mi (1232–1298) gave thought to the origins of foot binding and concluded that it

4 began with a dancer at the court of a highly cultivated ruler of the tenth century, prior to the Song Dynasty.

■ Slender and beautiful, Yaoniang was skilled in dancing. The ruler made a six-foot-tall golden lotus festooned with jewels, ribbons, and garlands of pearls and gems. Inside the lotus he piled five-colored auspicious clouds. He had Yaoniang wrap her feet with silk; he had them rendered slender and small, curving upward like the new moon. In plain socks she danced to the music “In the Clouds,” her posture was as though she was soaring into the clouds…. Later people imitated her, finding arched and slender feet wonderful. Thus is the origin of foot binding.

5 **Friar Odoric of Pordenone, *Travels of Friar Odoric*, ca. 1350.** Odoric, a friar from Pordenone, in Italy, visited north China in the 1320s and briefly mentioned foot binding in an account he dictated on his return.

■ And with the women the great beauty is to have little feet; and for this reason, mothers are accustomed, as soon as girls are born to them, to swathe their feet tightly so that they can never grow in the least.

6 **Photographic evidence of later practice, early twentieth century.** Western visitors to China in the nineteenth and early twentieth centuries found the practice of binding women’s feet strange and took photographs of women whose tiny pointed shoes could be seen, as well as women who were willing to pose with their feet uncovered, probably for pay. These two photographs were taken in the early twentieth century, shortly before an anti-foot-binding movement led most people to give up the practice.

ANALYZING THE EVIDENCE

1. Few men mentioned foot binding in their poetry, letters, or essays. Can we infer from this fact that foot binding was not widely practiced? Based on Sources 1–5, what other reasons could there have been for men not to mention it?
2. Which of the written sources (Sources 1–5) is most relevant in judging how common foot binding was? Explain your answer. Do you find in the evidence here any clues to why foot binding spread?
3. Do you think Odoric, the author of Source 5, saw women with bound feet or just heard about them? What is your evidence?
4. How would you compare the comments of the Italian visitor in Source 5 to those of the Chinese authors in Sources 1–4?
5. Is it useful to use much later photographic evidence, such as the images in Source 6, when trying to understand foot binding in Song and Yuan times? Is there any information that you cannot obtain any other way? What might have changed over the centuries in the ways feet were bound?

PUTTING IT ALL TOGETHER

Using the sources above, along with what you have learned in class and in this chapter, write a short essay that analyzes the early stage of the spread of foot binding in China.

China Under Mongol Rule

As discussed in Chapter 12, the Mongols conquered China in stages, gaining much of north China by 1215 and all of it by 1234, but not taking the south till the 1270s. The north suffered the most devastation. The non-Chinese rulers in the north, the Jin Dynasty of the Jurchen, thought they had the strongest army known to history. Yet Mongol tactics frustrated them. The Mongols would take a city, plunder it, and then withdraw, letting the Jin take it back and deal with the resulting food shortages and destruction. Under these circumstances, Jurchen power rapidly collapsed.

Not until Khubilai was Great Khan was the Song Dynasty defeated and south China brought under the control of the Mongols' Yuan Dynasty. Non-Chinese rulers had gained control of north China several times in Chinese history, but none of them had been able to secure control of the region south of the Yangzi River, which required a navy. By the 1260s Khubilai had put Chinese shipbuilders to work building a fleet, crucial to his victory over the Song (see "Chinggis's Successors" in Chapter 12).

Life in China under the Mongols was much like life in China under earlier alien rulers. Once order was restored, people did their best to get on with their lives. Some were deprived of their land, business, or freedom and suffered real hardship. Yet people still spoke Chinese, followed Chinese customary practices in dividing their family property, made offerings at local temples, and celebrated the new year and other customary festivals. Teachers still taught students the classics, scholars continued to write books, and books continued to be printed.

The Mongols, like other foreign rulers before them, did not see anything particularly desirable in the social mobility of Chinese society. Preferring stability, they assigned people hereditary occupations such as farmer, Confucian scholar, physician, astrologer, soldier, artisan, salt producer, miner, and Buddhist monk; the occupations came with obligations to the state. Besides these occupational categories, the Mongols classified the population into four grades, with the Mongols occupying the top grade. Next came various non-Chinese, such as the Uighurs and Persians. Below them were Chinese former subjects of the Jurchen, called the Han. At the bottom were the former subjects of the Song, called southerners.

Horse and Groom This painting by the Chinese artist Zhao Yong (1291–1361) would likely have appealed to the Mongol rulers, whose way of life was tied closely to their horses.

The reason for codifying ethnic differences this way was to preserve the Mongols’ privileges as conquerors. Chinese were not allowed to take Mongol names, and great efforts were made to keep them from passing as Mongols or marrying Mongols. To keep Chinese from rebelling, they were forbidden to own weapons or congregate in public.

As the Mongols captured Chinese territory, they recruited Chinese into their armies and government. Although some refused to serve the Mongols, others argued that the Chinese would fare better if Chinese were the administrators and could shield Chinese society from the most brutal effects of Mongol rule.

Nevertheless, government service, which had long been central to the identity and income of the educated elite in China, was not as widely available under the Mongols. The Mongols reinstituted the civil service examinations in 1315, but filled only about 2 percent of the positions in the bureaucracy through them and reserved half of those places for Mongols.

The scholar-official elite without government employment turned to alternative ways to support themselves. Those who did not have land to live off of found work as physicians, fortune-tellers, children’s teachers, Daoist priests, publishers, booksellers, or playwrights. Many took leadership roles at the local level, such as founding academies for Confucian learning or promoting local charitable ventures. Through such activities, scholars without government offices could assert the importance of civil over military values and see themselves as trustees of the Confucian tradition.

Since the Mongols wanted to extract wealth from China, they had every incentive to develop the economy. They encouraged trade both within China and beyond its borders and tried to keep paper money in circulation. (See “Global Viewpoints: Explaining the Workings of Paper Money in China, Persia, and Europe” in Chapter 12.) They repaired the Grand Canal, which had been ruined during their initial conquest of north China. Chinese industries with strong foreign markets, such as porcelain, thrived. Nevertheless, the economic expansion of late Tang and Song times did not continue under the alien rule of the Jurchens and Mongols.

The Mongols’ Yuan Dynasty began a rapid decline in the 1330s as disease, rebellions, and poor leadership led to disorder throughout the country. When a Chinese strongman succeeded in consolidating the south, the Mongol rulers retreated to Mongolia before he could take Beijing. By 1368 the Yuan Dynasty had given way to a new Chinese-led dynasty: the Ming.

Korea Under the Koryŏ Dynasty, 935–1392

How did Korean society and culture develop in an age when its northern neighbors were Khitans, Jurchens, and Mongols?

During the Silla period, Korea was strongly tied to Tang China and avidly copied China's model (see "Korea" in Chapter 7). This changed along with much else in North Asia between 800 and 1400. In this period Korea lived more in the shadows of the powerful states of the Khitans, Jurchens, and Mongols than in those of the Chinese.

The Silla Dynasty began to decline after the king was killed in a revolt in 780. For the next 155 years, rebellions and coups d'état followed one after the other, as different groups of nobles placed their candidates on the throne and killed as many of their opponents as they could.

The dynasty that emerged from this confusion was called Koryŏ (935–1392). (The English word *Korea* derives from the name of this dynasty.) During this time Korea developed more independently of the China model than it had in Silla times. This was not because the Chinese model was rejected; the Koryŏ (KAWR-yoh) capital was laid out on the Chinese model, and the government was closely patterned on the Tang system. But despite Chinese influence, Korean society remained deeply aristocratic.

The Koryŏ Dynasty, 935–1392

The founder of the dynasty, Wang Kon (877–943), was a man of relatively obscure maritime background, and he needed the support of the old aristocracy to maintain control. His successors introduced civil service examinations on the Chinese model, as well as examinations for Buddhist clergy, but because the aristocrats were the best educated and the government schools admitted only the sons of aristocrats, this system served primarily to solidify their control.

At the other end of the social scale, the number of people in the serf-slave stratum seems to have increased. This lowborn stratum included not only privately held slaves but also large numbers of government slaves as well as government workers in mines, porcelain factories, and other government industries. Sometimes entire villages or groups of villages were considered lowborn. There were occasional slave revolts, and some freed slaves did rise in status, but prejudice against anyone with slave ancestors was so strong that the law provided that "only if there is no evidence of lowborn status for eight generations in one's official household registration may one receive a position in the government."[2] In China and Japan, by contrast, slavery was a much more minor element in the social landscape.

The commercial economy declined in Korea during this period. Except for the capital, there were no cities of commercial importance, and in the countryside the use of money declined. One industry that did flourish was ceramics.

Buddhism remained strong throughout Korea, and monasteries became major centers of art and learning. As in Song China and Kamakura Japan, Chan (Zen) and Tiantai (Tendai) were the leading Buddhist teachings. The founder of the Koryŏ Dynasty attributed the dynasty's success to the Buddha's protection, and he and his successors were ardent patrons of the church. The entire Buddhist canon was printed in the eleventh century and again in the thirteenth. As in medieval Europe, aristocrats who entered the church occupied the major abbacies. As in Japan (but not China), some monasteries accumulated military power.

The Koryŏ Dynasty was preserved in name long after the ruling family had lost most of its power. In 1170 the palace guards massacred the civil officials at court and placed a new king on the throne. After incessant infighting among the generals and a series of coups, in 1196 the general Ch'oe Ch'ung-hon took control. The domination of Korea by the Ch'oe family was much like the contemporaneous situation in Japan, where warrior bands were seizing power. Moreover, because the Ch’oes were content to dominate the government while leaving the Koryŏ king on the throne, they had much in common with the Japanese shoguns, who followed a similar strategy.

Wooden Blocks for Printing The Heainsa Buddhist Temple in Korea has preserved the more than eighty thousand woodblocks used to print the huge Buddhist canon in the thirteenth century. The monk shown here is replacing a block. All the blocks are carved on both sides and stabilized by wooden frames that have kept them from warping.

Korea, from early times, recognized China as being in many ways senior to it, but when strong non-Chinese states emerged to its north in Manchuria, Korea was ready to accommodate them as well. Koryŏ ’s first neighbor to the north was the Khitan state of Liao, which in 1010 invaded and sacked the capital. To avoid destruction, Koryŏ acceded to vassal status, but Liao invaded again in 1018. This time Koryŏ was able to repel the nomadic Khitans. Afterward a defensive wall was built across the Korean peninsula south of the Yalu River. When the Jurchens and their Jin Dynasty supplanted the Khitans’ Liao Dynasty, Koryŏ agreed to send them tribute as well.

As mentioned in Chapter 12, Korea was conquered by the Mongols, and the figurehead Koryŏ kings were moved to Beijing, where they married Mongol princesses, their descendants becoming more Mongol than Korean. This was a time of hardship for the Korean people. In the year 1254 alone, the Mongols enslaved two hundred thousand Koreans and took them away. Ordinary people in Korea suffered grievously when their land was used as a launching pad for the huge Mongol invasions of Japan. In this period Korea also suffered from frequent attacks by Japanese pirates, somewhat like the depredations of the Vikings in Europe a little earlier (see "Invasions and Migrations" in Chapter 14).

When Mongol rule in China fell apart in the mid-fourteenth century, it declined in Korea as well. Chinese rebels opposing the Mongols entered Korea and even briefly captured the capital in 1361. When the Ming Dynasty was established in China in 1368, the Koryŏ court was unsure how to respond. In 1388 a general, Yi Song-gye, was sent to oppose a Ming army at the northwest frontier. When he saw the strength of the Ming, he concluded that making an alliance was more sensible than fighting, and he led his troops back to the capital, where in 1392 he usurped the throne, founding the Chosŏn Dynasty.

Japan’s Heian Period, 794–1185

How did the Heian form of government contribute to the cultural flowering of Japan in this period?

As described in Chapter 7, during the seventh and eighth centuries the Japanese ruling house pursued a vigorous policy of adopting useful ideas, techniques, and policies from the more advanced civilization of China. The rulers built a splendid capital along Chinese lines in Nara and fostered the growth of Buddhism. Monasteries grew so powerful in Nara, however, that in less than a century the court decided to move away from them and encourage other sects of Buddhism.

The new capital was built about twenty-five miles away at Heian (HAY-ahn) (modern Kyoto). Like Nara, Heian was modeled on the Tang capital of Chang’an. For the first century at Heian the government continued to follow Chinese models, but it turned away from them with the decline of the Tang Dynasty in the late ninth century. During the Heian period (794–1185), Japan witnessed a literary and cultural flowering under the rule of the Fujiwara family.

Fujiwara Rule

Only the first two Heian emperors were much involved in governing. By 860 political management had been taken over by a series of regents from the Fujiwara family, who supplied most of the empresses in this period. The emperors continued to be honored, but the Fujiwaras ruled. Fujiwara dominance represented the privatization of political power and a return to clan politics. Political history thus took a very different course in Japan than in China, where, when a dynasty weakened, military strongmen would compete to depose the emperor and found their own dynasties. In Japan for the next thousand years, political contenders sought to manipulate the emperors rather than supplant them.

The Fujiwaras reached the apogee of their glory under Fujiwara Michinaga (r. 995–1027). Like many aristocrats of the period, he was learned in Buddhism, music, poetry, and Chinese literature and history. He dominated the court for more than thirty years as the father of four empresses, the uncle of two emperors, and the grandfather of three emperors. He acquired great landholdings and built fine palaces for himself and his family. After ensuring that his sons could continue to rule, he retired to a Buddhist monastery, all the while continuing to maintain control.

By the end of the eleventh century several emperors who did not have Fujiwara mothers had found a device to counter Fujiwara control: they abdicated but continued to exercise power by controlling their young sons on the throne. This system of rule has been called **cloistered government** because the retired emperors took Buddhist orders, while maintaining control of the government from behind the scenes.

cloistered government A system in which an emperor retired to a Buddhist monastery but continued to exercise power by controlling his young son on the throne.

Aristocratic Culture

A brilliant aristocratic culture developed in the Heian period. In the capital at Heian, nobles, palace ladies, and imperial family members lived a highly refined and leisured life. In their society, niceties of birth, rank, and breeding counted for everything. The elegance of one's calligraphy and the allusions in one's poems were matters of intense concern to both men and women at court, as was their dress. Courtiers did not like to leave the capital, and some like the court lady Sei Shonagon shuddered at the sight of ordinary working people. In her *Pillow Book*, she wrote of encountering a group of commoners on a pilgrimage: "They looked like so many basket-worms as they crowded together in their hideous clothes, leaving hardly an inch of space between themselves and me. I really felt like pushing them all over sideways."[3] (See "Analyzing the Evidence: *The Pillow Book* of Sei Shonagon," page 366.)

The Tale of Genji In this scene from a twelfth-century painting illustrating *The Tale of Genji*, Genji has his inkstone and brushes ready to respond to the letter he is reading.

In this period a new script was developed for writing Japanese phonetically. Each symbol was based on a simplified Chinese character and represented one of the syllables used in Japanese (such as *ka*, *ki*, *ku*, *ke*, *ko*). Although “serious” essays, histories, and government documents continued to be written in Chinese, less formal works such as poetry and memoirs were written in Japanese. Mastering the new writing system took much less time than mastering writing in Chinese and this aided the spread of literacy, especially among women in court society.

In the Heian period, women played important roles at all levels of society. Women educated in the arts and letters could advance at court as attendants to the ruler’s empress and other consorts. Women could inherit property from their parents, and they would compete with their brothers for shares of the family property. In political life, marrying a daughter to an emperor or shogun was one of the best ways to gain power, and women often became major players in power struggles.

The literary masterpiece of this period is **The Tale of Genji**, written in Japanese by Lady Murasaki over several years (ca. 1000–1010). This long narrative depicts a cast of characters enmeshed in court life, with close attention to dialogue and personality. Murasaki also wrote a diary that is similarly revealing of aristocratic culture.

The Tale of Genji A Japanese literary masterpiece about court life written by Lady Murasaki.

Murasaki was one of many women writers in this period. The wife of a high-ranking court official wrote a poetic memoir of her unhappy twenty-year marriage to him and his rare visits. A woman wrote both an autobiography that related her father's efforts to find favor at court and a love story of a hero who travels to China. Another woman even wrote a history that concludes with a triumphal biography of Fujiwara Michinaga.

Buddhism remained very strong throughout the Heian period. A mission sent to China in 804 included two monks in search of new texts. One of the monks, Saichō, spent time at the monasteries on Mount Tiantai and brought back the Buddhist teachings associated with that mountain (called Tendai in Japanese). Tendai's basic message is that all living beings share the Buddha nature and can be brought to salvation. Once back in Japan, Saichō established a monastery on Mount Hiei outside Kyoto, which grew to be one of the most important monasteries in Japan. By the twelfth century this monastery and its many branch temples had vast lands and a powerful army of monk-soldiers to protect its interests.

Kūkai, the other monk on the 804 mission to China, came back with texts from another school of Buddhism — Shingon, or "True Word," a form of **Esoteric Buddhism**. Esoteric Buddhism is based on the idea that teachings containing the secrets of enlightenment had been secretly transmitted from the Buddha. People can gain access to these mysteries through initiation into the mandalas (cosmic diagrams), mudras (gestures), and mantras (verbal formulas). On his return to Japan, Kūkai attracted many followers and was allowed to establish a monastery at Mount Kōya, south of Osaka. The popularity of Esoteric Buddhism was a great stimulus to Buddhist art.

Esoteric Buddhism A sect of Buddhism that maintains that the secrets of enlightenment have been secretly transmitted from the Buddha and can be accessed through initiation into the mandalas, mudras, and mantras.

ANALYZING THE EVIDENCE

The Pillow Book of Sei Shonagon

Beginning in the late tenth century Japan produced a series of great women writers. At the time women were much freer than men to write in vernacular Japanese, giving them a large advantage. Lady Murasaki, author of the novel The Tale of Genji, is the most famous of the women writers of the period, but her contemporary Sei Shonagon is equally noteworthy. Sei Shonagon served as a lady in waiting to Empress Sadako during the last decade of the tenth century (990–1000). Her only known work is The Pillow Book, a collection of notes, character sketches, anecdotes, descriptions of nature, and eccentric lists such as boring things, awkward things, hateful things, and things that have lost their power.

The Pillow Book portrays the lovemaking/marriage system among the aristocracy more or less as it is depicted in The Tale of Genji. Marriages were arranged for family interests, and a man could have more than one wife. Wives and their children commonly stayed in their own homes, where their husbands and fathers would visit them. But once a man had an heir by his wife, there was nothing to prevent him from establishing relations with other women. Some relationships were long-term, but many were brief, and men often had several lovers at the same time. Some women became known as lovers with many conquests, others as abandoned women whose husbands ignored them. The following passage from The Pillow Book looks on this lovemaking system with amused detachment.

It is so stiflingly hot in the Seventh Month that even at night one keeps all the doors and lattices open. At such times it is delightful to wake up when the moon is shining and to look outside. I enjoy it even when there is no moon. But to wake up at dawn and see a pale sliver of a moon in the sky — well, I need hardly say how perfect that is.

I like to see a bright new straw mat that has just been spread out on a well-polished floor. The best place for one’s three-foot curtain of state is in the front of the room near the veranda. It is pointless to put it in the rear of the room, as it is most unlikely that anyone will peer in from that direction.

It is dawn and a woman is lying in bed after her lover has taken his leave. She is covered up to her head with a light mauve robe that has a lining of dark violet; the colour of both the outside and the lining is fresh and glossy. The woman, who appears to be asleep, wears an unlined orange robe and a dark crimson skirt of stiff silk whose cords hang loosely by her side, as if they have been left untied. Her thick tresses tumble over each other in cascades, and one can imagine how long her hair must be when it falls freely down her back.

Nearby another woman’s lover is making his way home in the misty dawn. He is wearing loose violet trousers, an orange hunting costume, so lightly coloured that one can hardly tell whether it has been dyed or not, a white robe of still silk, and a scarlet robe of glossy, beaten silk. His clothes, which are damp from the mist, hang loosely about him. From the dishevelment of his side locks one can tell how negligently he must have tucked his hair into the black lacquered headdress when he got up. He wants to return and write his next-morning letter before the dew on the morning glories has had time to vanish; but the path seems endless, and to divert himself he hums “the sprouts in the flax fields.”

As he walks along, he passes a house with an open lattice. He is on his way to report for official duty, but cannot help stopping to lift up the blind and peep into the room. It amuses him to think that a man has probably been spending the night here and has only recently got up to leave, just as happened to himself. Perhaps that man too had felt the charm of the dew.

Looking around the room, he notices near the woman’s pillow an open fan with a magnolia frame and purple paper; and at the foot of her curtain of state he sees some narrow strips of Michinoku paper and also some other paper of a faded colour, either orange-red or maple.

The woman senses that someone is watching her and, looking up from under her bedclothes, sees a gentleman leaning against the wall by the threshold, a smile on his face. She can tell at once that he is the sort of man with whom she need feel no reserve. All the same, she does not want to enter into any familiar relations with him, and she is annoyed that he should have seen her asleep.

“Well, well, Madam,” says the man, leaning forward so that the upper part of his body comes behind her curtains, “what a long nap you’re having after your morning adieu! You really are a lie-abed!”

“You call me that, Sir,” she replied, “only because you’re annoyed at having had to get up before the dew had time to settle.”

Their conversation may be commonplace, yet I find there is something delightful about the scene.

Now the gentleman leans further forward and, using his own fan, tries to get hold of the fan by the woman’s pillow. Fearing his closeness, she moves further back into her curtain enclosure, her heart pounding. The gentleman picks up the magnolia fan and, while examining it, says in a slightly bitter tone, “How standoffish you are!”

But now it is growing light; there is a sound of people’s voices, and it looks as if the sun will soon be up. Only a short while ago this same man was hurrying home to write his next-morning letter before the mists had time to clear. Alas, how easily his intentions have been forgotten!

While all this is afoot, the woman’s original lover has been busy with his own next-morning letter, and now, quite unexpectedly, the messenger arrives at her house. The letter is attached to a spray of bush-clover, still damp with dew, and the paper gives off a delicious aroma of incense. Because of the new visitor, however, the woman’s servants cannot deliver it to her.

Finally it becomes unseemly for the gentleman to stay any longer. As he goes, he is amused to think that a similar scene may be taking place in the house he left earlier that morning.

QUESTIONS FOR ANALYSIS

1. What sorts of images does Sei Shonagon evoke to convey an impression of a scene?
2. What can you learn from this passage about the material culture of Japan in this period?
3. Why do you think Sei Shonagon was highly esteemed as a writer?

The Samurai and the Kamakura Shogunate, 1185–1333

What were the causes and consequences of military rule in Japan?

The gradual rise of a warrior elite over the course of the Heian period finally brought an end to the domination of the Fujiwaras and other Heian aristocratic families. In 1156 civil war broke out between the Taira and Minamoto warrior clans based in western and eastern Japan, respectively. Both clans relied on skilled warriors, later called samurai, who were rapidly becoming a new social class. A samurai and his lord had a double bond: in return for the samurai's loyalty and service, the lord granted him land or income. From 1159 to 1181 a Taira named Kiyomori dominated the court, taking the position of prime minister and marrying his daughter to the emperor. His relatives became governors of more than thirty provinces. Still, the Minamoto clan managed to defeat the Taira, and the Minamoto leader, Yoritomo, became **shogun**, or general-in-chief. With him began the Kamakura Shogunate (1185–1333). This period is often referred to as Japan's feudal period because it was dominated by a military class whose members were tied to their superiors by bonds of loyalty and supported by landed estates rather than salaries.

Military Rule

The similarities between military rule in Japan and feudalism in medieval Europe during roughly the same period have fascinated scholars, as have the very significant differences. In Europe feudalism emerged out of the fusion of Germanic and Roman social institutions and flowered under the impact of Muslim and Viking invasions. In Japan military rule evolved from a combination of the native warrior tradition and Confucian ethical principles of duty to superiors.

The emergence of the samurai was made possible by the development of private landholding. The government land allotment system, copied from Tang China, began breaking down in the eighth century (much as it did in China). By the ninth century local lords had begun escaping imperial taxes and control by commending (formally giving) their land to tax-exempt entities such as monasteries, the imperial family, and high-ranking officials. The local lord then received his land back as a tenant and paid his protector a small rent. The monastery or privileged individual received a steady income from the land, and the local lord escaped imperial taxes and control. By the end of the thirteenth century most land seems to have been taken off the tax rolls this way. Unlike peasants in medieval Europe, where similar practices of commendation occurred, those working the land in Japan never became serfs. Moreover, Japanese lords rarely lived on the lands they had rights in, unlike English or French lords, who lived on their manors.

Samurai (SAM-moo-righ) resembled European knights in several ways. Both were armed with expensive weapons, and both fought on horseback. Just as the knight was supposed to live according to the chivalric code, so Japanese samurai were expected to live according to **Bushido** (boo-she-doh), or "way of the warrior." Physical hardship was accepted as routine, and soft living was despised as weak and unworthy. Disloyalty brought social disgrace, which the samurai could avoid only through *seppuku*, ritual suicide by slashing his belly.

Bushido Literally, the "way of the warrior"; the code of conduct by which samurai were expected to live.

The Kamakura Shogunate derives its name from Kamakura, a city near modern Tokyo that was the seat of the Minamoto clan. The founder, Yoritomo, ruled the country much the way he ran his own estates, appointing his retainers to newly created offices. To cope with the emergence of hard-to-tax estates, he put military land stewards in charge of seeing to the estates’ proper operation. To bring order to the lawless countryside, he appointed military governors to oversee the military and enforce the law in the provinces. They supervised the conduct of the land stewards in peacetime and commanded the provincial samurai in war.

Yoritomo’s wife, Masako, protected the interests of her own family, the Hōjōs, especially after Yoritomo died. She went so far as to force her first son to abdicate when he showed signs of preferring the family of his wife to the family of his mother. She later helped her brother take power away from her father. Thus the process of reducing power holders to figureheads went one step further in 1219 when the Hōjō family reduced the shogun to a figurehead. The Hōjō family held the reins of power for more than a century until 1333.

The Mongols’ two massive seaborne invasions in 1274 and 1281 were a huge shock to the shogunate. Although the Hōjō regents, with the help of a “divine wind” (kamikaze), repelled the Mongols, they were unable to reward their vassals in the traditional way because little booty was found among the wreckage of the Mongol fleets. Discontent grew among the samurai, and by the fourteenth century the entire political system was breaking down. Both the imperial and the shogunate families were fighting among themselves. As land grants were divided, samurai became impoverished.

Kamakura Shogunate, 1185–1333

The factional disputes among Japan's leading families remained explosive until 1331, when the emperor Go-Daigo tried to recapture real power. Go-Daigo destroyed the Kamakura Shogunate in 1333 but soon lost the loyalty of his followers. By 1336 one of his most important military supporters, Ashikaga Takauji, had turned on him and established the Ashikaga Shogunate, which lasted until 1573. Takauji's victory was also a victory for the samurai, who took over civil authority throughout Japan.

Night Attack on the Sanjo Palace The twelfth-century civil wars in Japan became the subject of long novels and pictorial handscrolls. This scene from a mid-thirteenth-century painting shows the quick, violent attack on the palace where the retired emperor lived.

Cultural Trends

The cultural distance between the elites and the commoners narrowed a little during the Kamakura period. Buddhism was spread to ordinary Japanese by energetic preachers. Honen (1133–1212) propagated the Pure Land teaching, preaching that paradise could be reached through simple faith in the Buddha and repeating the name of the Buddha Amitabha (ah-mee-tah-bah). His follower Shinran (1173–1263) taught that monks should not shut themselves off in monasteries but should marry and have children. A different path was promoted by Nichiren (1222–1282), a fiery and intolerant preacher who proclaimed that to be saved, people had only to invoke sincerely the Lotus Sutra, one of the most important of the Buddhist sutras. These lay versions of Buddhism found a receptive audience among ordinary people in the countryside.

It was also during the Kamakura period that **Zen** came to flourish in Japan. Zen teachings originated in Tang China, where they were known as Chan (see “Tang Culture” in Chapter 7). Rejecting the authority of the sutras, Zen teachers claimed the superiority of mind-to-mind transmission of Buddhist truth. This teaching found eager patrons among the samurai, who were attracted to its discipline and strong master-disciple bonds.

Zen A school of Buddhism that emphasized meditation and truths that could not be conveyed in words.

During the Kamakura period, war tales continued the tradition of long narrative prose works. *The Tale of the Heike* tells the story of the fall of the Taira family and the rise of the Minamoto clan. The tale reached a large and mostly illiterate audience because blind minstrels would chant sections to the accompaniment of a lute. The story is suffused with the Buddhist idea of the transience of life and the illusory nature of glory. Yet it also celebrates strength, courage, loyalty, and pride.

After stagnating in the Heian period, agricultural productivity began to improve in the Kamakura period, and the population grew, reaching perhaps 8.2 million by 1333. Much like farmers in contemporary Song China, Japanese farmers adopted new strains of rice, often double-cropped in warmer regions, made increased use of fertilizers, and improved irrigation for paddy rice. Besides farming, ordinary people made their livings as artisans, traders, fishermen, and entertainers. A vague category of outcasts occupied the fringes of society, in a manner reminiscent of India. Buddhist strictures against killing and Shinto ideas of pollution probably account for the exclusion of butchers, leatherworkers, morticians, and lepers, but other groups, such as bamboo whisk makers, were also traditionally excluded for no obvious reason.

Chapter Summary

The countries of East Asia — China, Japan, and Korea — all underwent major changes in the six centuries from 800 to 1400. In China the loosening of the central government's control of the economy stimulated trade and economic growth. Between 800 and 1100 China's population doubled to 100 million. The economic center of China shifted from the north China plain to the south, the milder region drained by the Yangzi River.

In the Song period, the booming economy and the invention of printing allowed for expansion of the scholar-official class, which came to dominate government and society. Repeatedly, the Song government chose to pay tribute to its militarily powerful neighbors — first the Khitans, then the Jurchens, then the Mongols — to keep the peace. Eventually, however, Song fell to the Mongols.

During the Koryŏ Dynasty, Korea evolved more independently of China than it had previously, in part because it had to placate powerful non-Chinese neighbors. The commercial economy declined, and an increasing portion of the population was unfree, working as slaves for aristocrats or the government. Military strongmen dominated the government, but their armies were no match for the much larger empires to their north. The period of Mongol domination was particularly difficult.

In Heian Japan, a tiny aristocracy dominated government and society. A series of regents, most of them from the Fujiwara family and fathers-in-law of the emperors, controlled political life. The aristocratic court society put great emphasis on taste and refinement. Women were influential at the court and wrote much of the best literature of the period. The Heian aristocrats had little interest in life in the provinces, which gradually came under the control of military clans.

After a civil war between the two leading military clans, a military government, called the shogunate, was established. Two invasions by the Mongols caused major crises in military control. Although both times the invaders were repelled, defense costs were high. During this period culture was less centered on the capital, and Buddhism spread to ordinary people.

CONNECTIONS

East Asia faced many internal and external challenges between 800 and 1400, and the ways societies responded to them shaped their subsequent histories. In China the first four centuries of this period saw economic growth, urbanization, the spread of printing, and the expansion of the educated class. In Korea and Japan aristocratic dominance and military rule were more typical of the era. All three areas, but especially China and Korea, faced an unprecedented challenge from the Mongols, with Japan less vulnerable because it did not share a land border. The challenges of the period did not hinder creativity in the literary and visual arts; among the greatest achievements of this era are the women's writings of Heian Japan, such as *The Tale of Genji*, and landscape painting of both Song and Yuan China.

Europe during these six centuries, the subject of the next chapter, also faced invasions from outside; in its case, the pagan Vikings were especially dreaded. Europe had a social structure more like that of Korea and Japan than of China, with less centralization and a more dominant place in society for military men. The centralized church in Europe, however, was unlike anything known in East Asian history. These centuries in Europe saw a major expansion of Christendom, especially to Scandinavia and eastern Europe, through both conversion and migration. Although there were scares that the Mongols would penetrate deeper into Europe, the greatest challenge in Europe was the Black Death and the huge loss of life that it caused.

Hedwig of Silesia

Noblewomen in medieval Europe played a wide variety of roles. Hedwig of Silesia (a territory now located mostly in Poland) conducted diplomatic

negotiations, ruled her husband's territory when he was away, founded monasteries, and worked to expand Christianity in eastern Europe.

By the fifteenth century scholars in the growing cities of northern Italy had begun to think that they were living in a new era, one in which the glories of ancient Greece and Rome were being reborn. What separated their time from classical antiquity, in their opinion, was a long period of darkness and barbarism, to which a seventeenth-century professor gave the name "Middle Ages." In this conceptualization, the history of Europe was divided into three periods — ancient, medieval, and modern — an organization that is still in use today. Later, the history of other parts of the world was sometimes fit into this three-period schema as well, with discussions of the "classical" period in Maya history, of "medieval" India and China, and of "modern" everywhere.

Today historians often question whether labels of past time periods for one culture work on a global scale, and some scholars are uncertain about whether "Middle Ages" is a just term even for European history. They assert that the Middle Ages was not simply a period of stagnation between two high points but rather a time of enormous intellectual energy and creative vitality. While agrarian life continued to dominate Europe, political structures that would influence later European history began to form, and Christianity continued to spread. People at the time did not know that they were living in an era that would later be labeled "middle" or sometimes even "dark," and we can wonder whether they would have shared this negative view of their own times.

Political Developments

How did medieval rulers restore order and centralize political power?

In 800 Charlemagne, the most powerful of the Carolingians, was crowned Holy Roman emperor. After his death his empire was divided among his grandsons, and their kingdoms were weakened by nobles vying for power. In addition, beginning around 800 western Europe was invaded by several different groups. Local nobles were the strongest power, and common people turned to them for protection. By the eleventh century, however, rulers in some parts of Europe had reasserted authority and were slowly building centralized states.

Invasions and Migrations

The Vikings were pagan Germanic peoples from Norway, Sweden, and Denmark. They began to make overseas expeditions, which they themselves called *vikings*, and the word came to be used for people who went on such voyages as well. Viking voyages and attacks began around 800, and by the mid-tenth century the Vikings had brought large sections of continental Europe and Britain under their sway. In the east they sailed the rivers of Russia as far as the Black Sea. In the west they established permanent settlements in Iceland and short-lived ones in Greenland and Newfoundland in Canada (Map 14.1).

Mapping the Past

MAP 14.1 Invasions and Migrations of the Ninth and Tenth Centuries This map shows the Viking, Magyar, and Muslim invasions and migrations in the ninth and tenth centuries. Compare it with Map 8.2 on the barbarian migrations of late antiquity to answer the following questions.

ANALYZING THE MAP What similarities do you see in the patterns of migration in these two periods? What significant differences?

CONNECTIONS How did the Vikings' expertise in shipbuilding and sailing make their migrations different from those of earlier Germanic tribes? How did this set them apart from the Magyar and Muslim invaders of the ninth century?

Against Viking ships navigated by experienced and fearless sailors, the Carolingian Empire, with no navy, was helpless. At first the Vikings attacked and sailed off laden with booty. Later, on returning, they settled down and colonized the areas they had conquered, often marrying local women and adopting the local languages and some of the customs.

Along with the Vikings, groups of central European steppe peoples known as Magyars (MAG-yahrz) also raided villages in the late ninth century. Moving westward, small bands of Magyars on horseback reached far into Europe. They subdued northern Italy, compelled Bavaria and Saxony to pay tribute, and penetrated into the Rhineland and Burgundy. Western Europeans thought of them as returning Huns, so the Magyars came to be known as Hungarians.

From North Africa, the Muslims also began new encroachments in the ninth century. They already ruled most of Spain and now conquered Sicily, driving northward into central Italy and the south coast of France.

From the perspective of those living in what had been Charlemagne's empire, Viking, Magyar, and Muslim attacks contributed to increasing disorder and violence. Italian, French, and English sources often describe this period as one of terror and chaos. People in other parts of Europe might have had a different opinion. In Muslim Spain and Sicily scholars worked in thriving cities, and new crops such as cotton and sugar enhanced ordinary people's lives. In eastern Europe the Magyars settled in an area that is now Hungary, becoming a strong kingdom. A Viking point of view might be the most positive, for by 1100 descendants of the Vikings not only ruled their homelands in Norway, Sweden, and Denmark but also ruled northern France (a province known as Normandy, or land of the Northmen), England, Sicily, Iceland, and Russia, with an outpost in Greenland and occasional voyages to North America.

"Feudalism" and Manorialism

The large-scale division of Charlemagne's empire into three parts in the ninth century led to a decentralization of power at the local level in western and central Europe. Civil wars weakened the power and prestige of kings, who could do little about regional violence. Likewise, the invasions of the ninth century, especially those of the Vikings, weakened royal authority. The Frankish kings were unable to halt the invaders, and the local aristocracy had to assume responsibility for defense. Thus, in the ninth and tenth centuries, aristocratic families increased their authority in their local territories, and distant and weak kings could not interfere. Common people turned for protection to the strongest power, the local nobles.

The most powerful nobles were those who gained warriors' allegiance, often symbolized in an oath-swearing ceremony of homage and fealty that grew out of earlier Germanic oaths of loyalty. In this ceremony a warrior (knight) swore his loyalty as a **vassal** to the more powerful individual, who became his lord. In return for the vassal's loyalty, aid, and military assistance, the lord promised him protection and material support. This support might be a place in the lord's household but was more likely land of the vassal's own, called a **fief** (*feudum* in Latin). The fief, which might contain forests, churches, and towns, technically still belonged to the lord, and the vassal had only the use of it. Earlier legal scholars and historians identified these personal ties of loyalty cemented by grants of land as a political and social system they termed **feudalism**. More recently, increasing numbers of medieval historians have found the idea of "feudalism" problematic, because the word was a later invention and the system was so varied and changed over time. They still point to the personal relationship between lords and vassals as the key way that political authority was organized and note that the church also received and granted land. In the Byzantine Empire as well, nobles, monasteries, and church officials held the most land.

vassal A knight who has sworn loyalty to a particular lord.

fief A portion of land, the use of which was given by a lord to a vassal in exchange for the latter's oath of loyalty.

feudalism A medieval European political system that defines the military obligations and relations between a lord and his vassals and involves the granting of fiefs.

Peasants living on a fief produced the food and other goods necessary to maintain the nobles and churchmen, under a system of **manorialism**, in which they exchanged their work for the lord's protection. They received land to farm, but were tied to the land by various payments and services. Most significantly, a peasant lost his or her freedom and became a **serf**, part of the lord's permanent labor force. Unlike slaves, serfs were personally free, but they were bound to the land and unable to leave it without the lord's permission.

manorialism The economic system that governed rural life in medieval Europe, in which the landed estates of a lord were worked by the peasants under the lord's jurisdiction in exchange for his protection.

serf A peasant who lost his or her freedom and became permanently bound to the landed estate of a lord.

Noblewomen sometimes inherited fiefs from their fathers if there were no sons, and were required to swear loyalty and provide troops.

By around 1000 the majority of western Europeans were serfs. In eastern Europe the transition was slower but longer lasting. Western European peasants began to escape from serfdom in the later Middle Ages, at the very point that serfs were more firmly tied to the land in eastern Europe, especially in eastern Germany, Poland, and Russia.

The Restoration of Order

The eleventh century witnessed the beginnings of political stability in much of Europe. Foreign invasions gradually declined, and in some parts of Europe lords in control of large territories built up their power even further, becoming kings over growing and slowly centralizing states. In a process similar to that occurring at the same time in the West African kingdom of Ghana (see “African Kingdoms and Empires” in Chapter 10), rulers expanded their territories and extended their authority by developing larger bureaucracies, armies, judicial systems, and other institutions to maintain control, as well as taxation systems to pay for them. These new institutions and practices laid the foundations for modern national states. Political developments in England, France, Germany, and Hungary provide good examples of the beginnings of the national state in the central Middle Ages.

The Viking Canute (kah-NOOT) (r. 1016–1035) made England the center of his empire, while promoting a policy of assimilation and reconciliation between Anglo-Saxons and Vikings. At the same time, England was divided into local shires, or counties, each under the jurisdiction of a sheriff appointed by the king. When Canute’s heir Edward died childless, there were three claimants to the throne. One of these, Duke William of Normandy, crossed the channel and won the English throne by defeating and killing his Anglo-Saxon rival, Harold II, at the Battle of Hastings in 1066. Later dubbed “the Conqueror,” William (r. 1066–1087) limited the power of the nobles and church officials and built a unified monarchy. He retained the Anglo-Saxon institution of sheriff, but named Normans to the posts.

The Norman Conquest, 1066

In 1128 William’s granddaughter Matilda married a powerful French noble, Geoffrey of Anjou. Their son, who became Henry II of England, inherited provinces in northwestern France from his father. When Henry married the great heiress Eleanor of Aquitaine in 1152, he claimed lordship over Aquitaine and other provinces in southwestern France as well. The histories of England and France were thus closely intertwined in the Middle Ages.

In the early twelfth century France consisted of a number of nearly independent provinces, each governed by its local ruler. The work of unifying and enlarging France began under Philip II (r. 1180–1223), also known as Philip Augustus. By the end of his reign Philip was effectively master of northern France, and by 1300 most of the provinces of modern France had been added to the royal domain.

In central Europe the German king Otto I (r. 936–973) defeated many other lords to build up his power, based on an alliance with and control of the church. Under Otto I and his successors, a loose confederation stretching from the North Sea to the Mediterranean developed. In this confederation, later called the Holy Roman Empire, the emperor shared power with princes, dukes, counts, city officials, archbishops, and bishops. Frederick Barbarossa (r. 1152–1190) of the house of Hohenstaufen (HOH-en-shtow-fen) tried valiantly to make the Holy Roman Empire a united state. When he tried to enforce his authority over the cities of northern Italy, however, they formed a league against him in alliance with the pope and defeated him. Germany did not become a unified state.

In eastern Europe, the Hungarians formed a tribal federation and then under Stephen I (r. 1000–1038) created a more centralized kingdom. Stephen became a devout Christian, defeated pagan rivals militarily, and received his crown from the pope as a symbol of their alliance. He further consolidated his power through war, diplomacy, and strategic marriages, and set up an administrative system based on counties. In the middle of the thirteenth century Hungary was invaded by the Mongols (see “Chinggis Khan and the Mongol Empire” in Chapter 12), which led the kings to construct stone castles to defend against further attacks and develop new military tactics.

Law and Justice

Throughout Europe in the twelfth and thirteenth centuries, the law was a hodgepodge of customs, feudal rights, and provincial practices. Rulers wanted to blend these elements into a uniform system of rules acceptable and applicable to all their peoples, though their success in doing so varied.

The French king Louis IX (r. 1226–1270) was famous for his concern for justice. Each French province, even after being made part of the kingdom of France, retained its unique laws and procedures. But Louis IX created a royal judicial system, establishing the Parlement of Paris, a kind of supreme court that heard appeals from lower courts.

Under Henry II (r. 1154–1189), England developed and extended a common law — a law common to and accepted by the entire country — which was unique in medieval Europe. Henry's son John (r. 1199–1216), however, met with serious disappointment after taking the throne. A combination of royal debt, increased taxation, and military failures fed popular discontent. A rebellion begun by northern barons grew, and in 1215 the barons forced him to attach his seal to the Magna Carta — the "Great Charter," which became the cornerstone of English justice and law. The Magna Carta was simply meant to assert traditional rights enjoyed by nobles, but in time it came to signify the broader principle that everyone, including the king and the government, must obey the law. In 1222 King Andrew II of Hungary was similarly forced by his nobles to agree to the "Golden Bull," affirming their freedom from taxation and right to disobey him if they thought he was acting against the law.

Statements of legal principles such as the Magna Carta or the Golden Bull were not how most people experienced the law in medieval Europe. Instead they were involved in actual cases. Judges determined guilt or innocence in a number of ways. In some cases, they ordered a trial by ordeal, in which the accused might be tied hand and foot and dropped in a lake or river. People believed that water was a pure substance and would reject anything foul or unclean. Thus a person who sank was considered innocent, while a person who floated was found guilty. Trials by ordeal were relatively rare, and courts increasingly favored more rational procedures, in which judges heard testimony, sought witnesses, and read written evidence if it was available. Violent crimes were often punished by public execution. Executioners were feared figures, but they were also well-paid public officials and were a necessary part of the legal structure.

The Christian Church

How did the Christian Church enhance its power and create new institutions and religious practices?

Kings and emperors were not the only rulers consolidating their power in the eleventh and twelfth centuries; the papacy did as well, although the popes' efforts were sometimes challenged by medieval kings and emperors. Despite such challenges, monasteries continued to be important places for learning and devotion, and new religious orders were founded. Christianity expanded into Europe's northern and eastern regions, and Christian rulers expanded their holdings in Muslim Spain.

Córdoba Mosque and Cathedral The huge arches of the Great Mosque at Córdoba dwarf the cathedral built in its center after the city was conquered by Christian armies in 1236. During the reconquista (see "The Expansion of Western and Eastern Christianity"), Christian kings often transformed mosques into churches, often by simply adding Christian elements such as crosses and altars to existing structures.

Papal Reforms

During the ninth and tenth centuries the Western Christian (Roman) Church came under the control of kings and feudal lords, who chose church officials in their territories, granting them fiefs that provided an income and expecting loyalty and service in return. Church offices were sometimes sold outright — a practice called *simony* (SIGH-moh-nee). Although the Western Church encouraged clerical celibacy, many priests were married or living with women. Wealthy families from the city of Rome often chose popes from among their members; thus popes paid more attention to their families' political fortunes or their own pleasures than to the church's institutional or spiritual health. Not surprisingly, clergy at all levels who had bought their positions or had been granted them for political reasons provided little spiritual guidance and were rarely models of high moral standards.

Beginning in the eleventh century a series of popes began to assert their power and also reformed the church. In 1054 the pope sent a delegation to the patriarch of Constantinople demanding that he recognize the pope as the head of the entire Christian Church. The patriarch refused, each side declared the other heretics, and the outcome was a schism between the Roman Catholic and the Orthodox Churches that deepened over the centuries and continues today.

Many popes believed that secular or lay control over the church was largely responsible for the lack of moral leadership, so they proclaimed the church independent from secular rulers. The Lateran Council of 1059 decreed that the authority and power to elect the pope rested solely in the college of cardinals, a special group of priests from the major churches in and around Rome.

Pope Gregory VII (pontificate 1073–1085) vigorously championed reform and the expansion of papal power. He ordered all priests to give up their wives and children or face dismissal, invalidated the ordination of church officials who had purchased their offices, and placed nuns under firmer control of male authorities. He believed that the pope was the vicar of God on earth and that papal orders were the orders of God. He emphasized the political authority of the papacy, ordering that any church official selected or appointed by a layperson should be deposed, and any layperson who appointed a church official should be excommunicated — cut off from the sacraments and the Christian community. European rulers protested this restriction of their power, and the strongest reaction came from Henry IV, the ruler of Germany who later became the Holy Roman emperor. The pope and the emperor used threats and diplomacy against each other, and neither was the clear victor.

Monastic Life

Although they were in theory cut off from the world (see "Christian

Monasticism" in Chapter 8), monasteries and convents were deeply affected by issues of money, rank, and power. During the ninth and tenth centuries many monasteries fell under the control and domination of local feudal lords. Powerful laymen appointed themselves or their relatives as abbots, took the lands and goods of monasteries, and spent monastic revenues.

Medieval monasteries also provided noble boys with education and opportunities for ecclesiastical careers. Although a few men who rose in the ranks of church officials were of humble origins, most were from high-status families. Social class also defined the kinds of religious life open to women. Kings and nobles usually established convents for their female relatives and other elite women, and the position of abbess, or head of a convent, became the most powerful position a woman could hold in medieval society. (See "Individuals in Society: Hildegard of Bingen," page 383.)

Routines within individual monasteries varied widely from house to house and from region to region. In every monastery, however, daily life centered on the liturgy or Divine Office, psalms, and other prayers, which monks and nuns said seven times a day and once during the night. Praying was looked on as a vital service. Prayers were said for peace, rain, good harvests, the civil authorities, the monks' and nuns' families, and their benefactors. Monastic patrons in turn lavished gifts on the monasteries, which often became very wealthy, controlling large tracts of land and the peasants who farmed them. The combination of lay control and wealth created problems for monasteries as monks and nuns concentrated on worldly issues and spiritual observance and intellectual activity declined.

In the thirteenth century the growth of cities provided a new challenge for the church. Many urban people thought that the church did not meet their spiritual needs. They turned instead to **heresy** — that is, to an idea, belief, or action that ran counter to doctrines that church leaders defined as correct. Various beliefs judged to be heresies had emerged in Christianity since its earliest centuries, and heretics were subject to punishment. In this period, heresies often called on the church to give up its wealth and power. Combating heresy became a principal task of new religious orders, most prominently the Dominicans and Franciscans, who preached and ministered to city dwellers; the Dominicans also staffed the papal Inquisition, a special court designed to root out heresy.

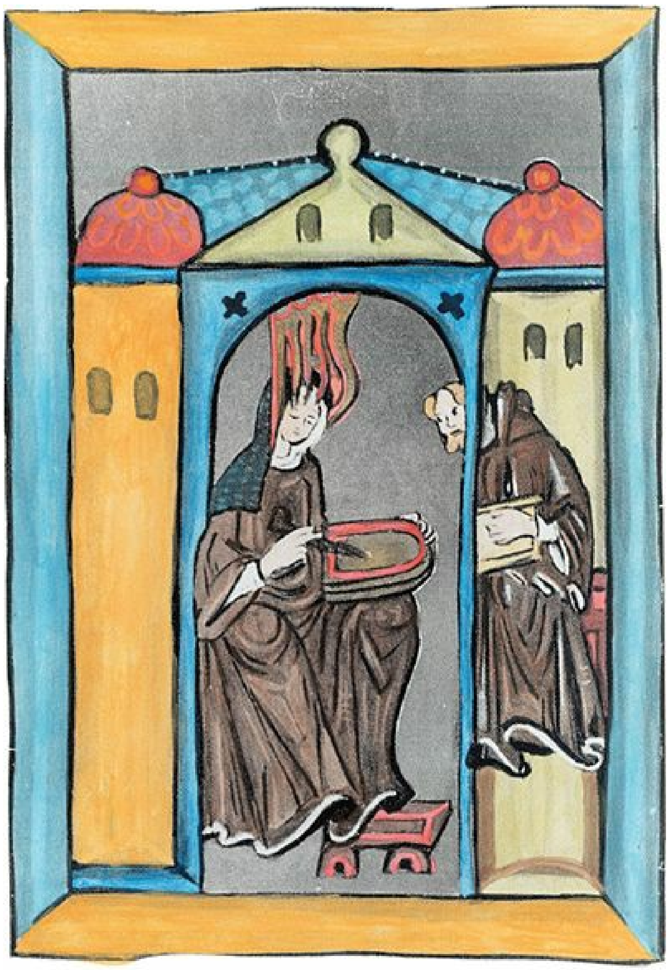
INDIVIDUALS IN SOCIETY

Hildegard of Bingen



Private Collection/Bridgeman Images

Inspired by heavenly fire, Hildegard begins to dictate her visions to her scribe. The original of this elaborately illustrated copy of *Scivias* disappeared from Hildegard's convent during World War II, but fortunately a facsimile had already been made.

THE TENTH CHILD OF A LESSER NOBLE FAMILY, HILDEGARD (1098–1179) was turned over to the care of an abbey in the Rhineland when she was eight years old. There she learned Latin and received a good education. She spent most of her life in various women's religious communities, two of which she founded herself. When she was a child, she began having mystical visions, often of light in the sky, but told few people about them. In middle age, however, her visions became more dramatic: "And it came to pass … when I was 42 years and 7 months old, that the heavens were opened and a blinding light of exceptional brilliance flowed through my entire brain. And so it kindled my whole heart and breast like a flame, not burning but warming … and suddenly I understood of the meaning of expositions of the books."* She wanted the church to approve of her visions and wrote first to Saint Bernard of Clairvaux, who answered her briefly and dismissively, and then to Pope Eugenius, who encouraged her to write them down. Her first work was *Scivias* (Know the Ways of the Lord), a record of her mystical visions that incorporates extensive theological learning.

Obviously possessed of leadership and administrative talents, Hildegard left her abbey in 1147 to found the convent of Rupertsberg near Bingen. There she produced *Physica* (On the Physical Elements) and *Causa et Curae* (Causes and Cures), scientific works on the curative properties of natural elements; poems; a religious play; and several more works of mysticism. She carried on a huge correspondence with scholars, prelates, and ordinary people. When she was over fifty, she left her community to preach to audiences of clergy and laity, and she was the only woman of her time whose opinions on religious matters were considered authoritative by the church.

Hildegard's visions have been explored by theologians and also by neurologists, who judge that they may have originated in migraine headaches, as she reports many of the same phenomena that migraine sufferers do: auras of light around objects, areas of blindness, feelings of intense doubt and intense euphoria. The interpretations that she develops come from her theological insight and learning, however, not from her illness. That same insight also emerges in her music, which is what she is best known for today. Eighty of her compositions survive — a huge number for a medieval composer — most of them written to be sung by the nuns in her convent, so they have strong lines for female voices. Many of her songs and chants have been recorded recently by various artists and are available on compact disk, as downloads, and on several websites.

QUESTIONS FOR ANALYSIS

1. Why do you think Hildegard might have kept her visions secret at first? Why do you think she eventually sought church approval for them?
2. In what ways were Hildegard's accomplishments extraordinary given women's general status in the Middle Ages?

Popular Religion

Religious practices varied widely from country to country and even from province to province. But everywhere, religion permeated everyday life.

For Christians, the village church was the center of community life, with the parish priest in charge of a host of activities. People gathered at the church for services on Sundays and holy days, breaking the painful routine of work. The feasts that accompanied celebrations were commonly held in the churchyard. In everyday life people engaged in rituals and used language heavy with religious symbolism. Everyone participated in village processions to honor the saints and ask their protection. The entire calendar was designed with reference to Christmas, Easter, and Pentecost, events in the life of Jesus and his disciples.

The Christian calendar was also filled with saints' days. Veneration of the saints had been an important tool of Christian conversion since late antiquity (see "Christian Missionaries and Conversion" in Chapter 8), and the cult of the saints was a central feature of popular culture in the Middle Ages. People believed that the saints possessed supernatural powers that enabled them to perform miracles, and each saint became the special property of the locality in which his or her relics — remains or possessions — rested. In return for the saint's healing powers and support, peasants would offer prayers, loyalty, and gifts. The Virgin Mary, Christ's mother, became the most important saint, with churches built and special hymns, prayers, and ceremonies created in her honor.

Statue of Saint Anne, the Virgin Mary, and the Christ Child Nearly every church had at least one image of the Virgin Mary, the most important figure of Christian devotion in medieval Europe. In this thirteenth-century wooden sculpture, she is shown holding the infant Jesus and is herself sitting on the lap of her mother, Anne. Statues such as this reinforced people's sense that the heavenly family was much like theirs, with grandparents who sometimes played important roles.

Most people in medieval Europe were Christian, but there were small Jewish communities scattered through many parts of Europe, as well as Muslims in the Iberian Peninsula, Sicily, other Mediterranean islands, and southeastern Europe. Increasing suspicion and hostility marked relations among believers in different religions throughout the Middle Ages, but there were also important similarities in the ways that each group understood and experienced their faiths. In all three traditions, every major life transition was marked by a ceremony that involved religious officials or spiritual elements. In all three faiths, death was marked by religious rituals, and the living had obligations to the dead, including prayers and special mourning periods.

The Expansion of Western and Eastern Christianity

The eleventh and twelfth centuries saw an expansion of Christianity into Scandinavia, the Baltic lands, eastern Europe, and Spain through wars, the establishment of new bishoprics, and the migration of Christian colonists. More and more Europeans began to think of themselves as belonging to a realm of Christianity that was political as well as religious, a realm they called Christendom.

Christian influences entered Scandinavia and the Baltic lands primarily through the creation of dioceses (church districts headed by bishops). This took place in Denmark and Norway in the tenth and eleventh centuries, and then in Sweden and Finland. In all of these areas, Christian missionaries preached, baptized, and built churches. Royal power advanced institutional Christianity, and traditional Norse religions practiced by the Vikings were outlawed. In central and eastern Europe the German emperor Otto I (see “The Restoration of Order”) planted a string of dioceses along his northern and eastern frontiers, hoping to pacify the newly conquered Slavs. German nobles built castles, ruthlessly crushed revolts by Slavic peoples, and encouraged German-speaking settlers to move east.

The expansion of Christianity in much of eastern Europe was organized by the Eastern Orthodox Church. King Rastislav of Moravia (r. 846–870) — now part of the Czech Republic — first sent envoys to Rome, but when the pope refused to send missionaries, he turned to the Byzantine emperor Michael III (r. 842–867), who sent the brothers Cyril (826–869) and Methodius (815–885). They invented a Slavic alphabet using Greek characters, later called the Cyrillic alphabet, and translated the Bible into Old Church Slavonic, the first Slavic literary language. Slightly later the rulers of Bulgaria weighed the benefits of Roman and Eastern Christianity, and decided for Eastern Christianity when the Byzantine patriarch agreed the Bulgarian Church could be independent and use Bulgarian as its official language.

In the tenth century other missionaries spread Christianity, the Cyrillic alphabet, and Byzantine art and architecture to what is now Russia. Vladimir I (r. 980–1015), the ruler of the largest state in the area, Kievan Rus, converted to Orthodox Christianity, in part to marry the daughter of the Byzantine emperor. He ordered a mass baptism for the residents of

Kiev in a local river, just as western European kings had for their subjects several centuries earlier (see “Christian Missionaries and Conversion” in Chapter 8).

The Iberian Peninsula was another area of Christian expansion. In about 950 Caliph Abd al-Rahman III (912–961) of the Umayyad Dynasty of Córdoba ruled most of the peninsula. Christian Spain consisted of a number of small kingdoms. In the eleventh century divisions and civil wars in the caliphate of Córdoba allowed Christian armies to conquer an increasingly large part of the Iberian Peninsula. By 1248 Christians held all of the peninsula save for the small state of Granada in the south.

Fourteenth-century clerical writers would call the movement to expel the Muslims the **reconquista** (ray-kon-KEES-tah) (reconquest) — a sacred and patriotic crusade to wrest the country from “alien” Muslim hands. This religious idea became part of Spanish political culture and of the national psychology. Rulers of the Christian kingdoms of Spain increasingly passed legislation discriminating against Muslims and Jews living under Christian rule, and they attempted to exclude anyone from the nobility who could not prove “purity of blood” — that is, that they had no Muslim or Jewish ancestors.

reconquista A fourteenth-century term used to describe the long Christian crusade to wrest Spain back from the Muslims; clerics believed it was a sacred and patriotic mission.

Spain was not the only place in Europe where “blood” became a way of understanding differences among people and a basis for discriminatory laws. When Germans moved into eastern Europe and English forces took over much of Ireland, they increasingly barred local people from access to legal courts and denied them positions in monasteries or craft guilds. They banned intermarriage between ethnic groups in an attempt to maintain ethnic purity, even though everyone was Christian.

The Crusades

What were the causes, course, and consequences of the Crusades?

The expansion of Christianity in the Middle Ages was not limited to Europe but extended to the eastern Mediterranean in what were later termed the **Crusades**. Occurring from the late eleventh to the late thirteenth century, the Crusades were wars sponsored by the papacy to recover the holy city of Jerusalem from the Muslims.

Crusades Holy wars sponsored by the papacy for the recovery of the holy city of Jerusalem from the Muslims.

Background and Motives

In the eleventh century the papacy had strong reasons for wanting to launch an expedition against Muslims in the East. Such an expedition would strengthen the pope's claim to be the leader of Christian society in the West and would bolster his claims to superiority over the patriarch of the Eastern Orthodox Church (see "The Western Church and the Eastern Church" in Chapter 8).

Popes and other church officials gained support for war in defense of Christianity by promising spiritual benefits to those who joined a campaign or died fighting. Preachers communicated these ideas widely and told stories about warrior-saints who slew hundreds of enemies.

Religious zeal led increasing numbers of people to go on pilgrimages to holy places, including Jerusalem. The Arab Muslims who had ruled Jerusalem and the surrounding territory for centuries generally allowed Christian pilgrims to travel freely, but in the late eleventh century the Seljuk Turks took over Palestine, defeating both Arabic and Byzantine armies and pillaging in Christian and Muslim parts of Asia Minor. They harassed pilgrims and looted churches, and the emperor at Constantinople appealed to the West for support. The emperor's appeal fit well with papal aims, and in 1095 Pope Urban II called for a great Christian holy war. Urban urged Christian knights who had been fighting one another to direct their energies against those he claimed were the true enemies of God, the Muslims.

The Course of the Crusades

Thousands of people of all classes responded to Urban's call, joining what became known as the First Crusade. The First Crusade was successful, mostly because of the dynamic enthusiasm of the participants, who had little more than religious zeal. They knew little of the geography or climate of the Middle East and could never agree on a leader. Adding to these disadvantages, supply lines were never set up, starvation and disease wracked the army, and the Turks slaughtered hundreds of noncombatants. Nevertheless, the army pressed on, besieging and taking several cities, including Antioch. After three years on the road, and a monthlong siege, the Crusaders took Jerusalem in July 1099 (Map 14.2). MAP 14.2 **The Crusades, 1096–1270** The Crusaders took many different sea and land routes on their way to Jerusalem, often crossing the lands of the Byzantine Empire, which led to conflict with Eastern Christians. The Crusader kingdoms in the East lasted only briefly.

With Jerusalem taken, some Crusaders regarded their mission as accomplished and set off for home. Others stayed, setting up institutions to rule local territories and the Muslim population. Four small "Crusader states" — Jerusalem, Edessa, Tripoli, and Antioch — were established, and castles and fortified towns were built in these states to defend against Muslim reconquest. Reinforcements arrived in the form of pilgrims and fighters from Europe, so that there was constant coming and going by land

and more often by sea after the Crusaders conquered port cities. Most Crusaders were men, but some women came along as well, assisting in the besieging of towns and castles by providing water to fighting men or foraging for food, working as washerwomen, and providing sexual services.

Between 1096 and 1270 the crusading ideal was expressed in eight papally approved expeditions, though none after the First Crusade accomplished very much. The Muslim states in the Middle East were politically fragmented when the Crusaders first came, and it took them about a century to reorganize. They did so dramatically under Saladin (Salah al-Din), who unified Egypt and Syria. In 1187 the Muslims retook Jerusalem, but the Christians held on to port towns, and Saladin allowed pilgrims safe passage to Jerusalem. From that point on, the Crusader states were more important economically than politically or religiously, giving Italian and French merchants direct access to Eastern products.

After the Muslims retook Jerusalem, the crusading movement faced other setbacks. During the Fourth Crusade (1202–1204), Crusaders stopped in Constantinople, and when they were not welcomed, they sacked the city. The Byzantine Empire splintered into three parts and soon consisted of little more than the city of Constantinople. Moreover, the assault of one Christian people on another made the split between the churches permanent and discredited the entire crusading movement in the eyes of many Christians.

In the late thirteenth century Turkish armies, after gradually conquering all other Muslim rulers, turned against the Crusader states. In 1291 the Christians’ last stronghold, the port of Acre, fell. Knights then needed a new battlefield for military actions, which some found in Spain, where the rulers of Aragon and Castile continued fighting Muslims until 1492.

THINKING LIKE A HISTORIAN

Christian and Muslim Views of the Crusades

Both Christians and Muslims wrote accounts of the Crusades as they happened, which circulated among those who could read and served as the basis for later histories and visual depictions. How do Christian and Muslim views differ, and how are they similar?

1 **Peter Tudebode on the fall of Antioch, 1098.** Peter Tudebode was a French priest who accompanied the First Crusade and later wrote an account of it.

■ There was a Turkish emir [high-ranking army officer], Firuz, who became very friendly with Bohemond [a Norman noble, one of the leaders of the First Crusade]. Often through mutual messengers Bohemond suggested that Firuz admit him to Antioch; and, in turn, the Norman offered him the Christian religion along with great wealth from many possessions. Firuz, in accepting these provisions, replied: "I pledge freely the delivery of three towers of which I am a custodian."… The knights took to the plain and the footmen to the mountain, and all night they maneuvered and marched until almost daybreak, when they came to the towers which Firuz guarded. Bohemond immediately dismounted and addressed the group: "Go in dare-devil spirit and great *elan*, and mount the ladder into Antioch, which shall soon be in our hands if God so wills." They then went to a ladder, which was raised and lashed to the walls of the city, and almost sixty of our men scaled the ladder and divided their forces in the towers guarded by Firuz.… [W]e crashed down the gate, and poured into Antioch.… At sunup the crusaders who were outside Antioch in their tents, upon hearing piercing shrieks arising from the city, raced out and saw the banner of Bohemond flying high on the hill. Thereupon they rushed forth and each one speedily came to his assigned gate and entered Antioch, killing Turks and Saracens whom they found.… Yaghi Siyan, commander of Antioch, in great fear of the Franks, took to heel along with many of his retainers.… All of the streets of Antioch were choked with corpses so that the stench of rotting bodies was unendurable, and no one could walk the streets without tripping over a cadaver.

2 **Ibn al-Athir on the fall of Antioch, early thirteenth century.** Ali Ibn al-Athir (1160–1223), a Kurdish scholar and historian who lived in Mosul (today's Iraq), wrote a history of the First Crusade that relied on Arab sources.

■ Yaghi Siyan, the ruler of Antioch, showed unparalleled courage and wisdom, strength and judgment. If all the Franks who died had survived they would have overrun all the lands of Islam. He protected the families of the Christians in Antioch and would not allow a hair of their heads to be touched. After the siege had been going on for a long time the Franks made a deal with … an armor-maker called Ruzbih whom they bribed with a fortune in money and lands. He worked in the tower that stood over the riverbed, where the river flowed out of the city into the valley. The Franks sealed their pact with the armor-maker, God damn him! and made their way to the watergate. They opened it and entered the city. Another gang of them climbed the tower with their ropes. At dawn, when more than 500 of them were in the city and the defenders were worn out after the night watch, they sounded their trumpets…. Panic seized Yaghi Siyan and he opened the city gates and fled in terror, with an escort of thirty pages…. This was of great help to the Franks, [who] entered the city by the gates and sacked it, slaughtering all the Muslims they found there….

It was the discord between the Muslim princes … that enabled the Franks to overrun the country.

3 **Fulcher of Chartres on the fall of Jerusalem to the Crusaders, 1099.** Fulcher was a chaplain to military leaders on the First Crusade and over several decades wrote a long and influential chronicle.

■ Soon thereafter the Franks gloriously entered the city at noon on the day known as Dies Veneris, the day in which Christ redeemed the whole world on the Cross. [That is, a Friday.] Amid the sound of trumpets and with everything in an uproar they attacked boldly, shouting “God help us!” At once they raised a banner in the city on the top of the wall…. They ran with the greatest exultation as fast as they could into the city and joined their companions in pursuing and slaying their wicked enemies without cessation…. If you had been there your feet would have been stained to the ankles in the blood of the slain. What shall I say? None of them were left alive. Neither women nor children were spared. How astonishing it would have seemed to you to see our squires and footmen, after they discovered the trickery of the Saracens, split open the bellies of those they had just slain in order to extract from the intestines the bezants [gold coins minted in Byzantium] which the Saracens had gulped down their loathsome throats while still alive! … After this great slaughter they entered the houses of the citizens, seizing whatever they found in them. This was done in such a way that whoever first entered a house, whether he was rich or poor, was not challenged by any other Frank. In this way many poor people became wealthy.

4 **Al-Isfahani on Saladin’s retaking of Jerusalem, 1187.** Imad ad-Din al-Isfahani (1125–1187) was a Persian scholar who served as secretary to Saladin and accompanied him on many of his military campaigns.

■ Saladin marched forward to take the reins of Jerusalem…. [T]he Franks despaired of finding any relief from their situation and decided all to give their lives (in defense of Jerusalem)…. The Sultan mounted catapults, and by this means milked the udders of slaughter…. [I]n every heart on either side burned the fire of longing, faces were exposed to the blade’s kiss, hearts were tormented with longing for combat…. Every onslaught was energetic and achieved its object, the goal was reached, the enemy wounded…. The city became Muslim and the infidel belt around it was cut…. By striking coincidence the date of the conquest of Jerusalem was the anniversary of the Prophet's ascension to heaven. Great joy reigned for the brilliant victory won, and words of prayer and invocation to God were on every tongue…. Ibn Barzun [Balian of Ibelin, one of the Crusader leaders] came out to secure a treaty with the Sultan, and asked for an amnesty for his people…. [A]n amount was fixed for which they were to ransom themselves and their possessions … ten dinar for every man, five for a woman, and two for a boy or girl…. Every man who paid left his house in safety, and the rest were to be enslaved…. The Franks began selling their possessions and taking their precious things out of safe-keeping…. They scavenged in their own churches and stripped them of their ornaments of gold and silver…. Then I said to the Sultan, "These are things of great riches; do not allow these rascals to keep this in their grasp." But he replied, "If we interpret the treaty to their disadvantage they will accuse us of breaking faith." So they carried away the most precious and lightest [objects] and shook from their hands the dust of their heritage.

5 **Capture of Antioch.** This illustration comes from a 1280 version of William of Tyre's *A History of Deeds Beyond the Sea*, the most widely read account of the Crusades, which drew extensively on earlier histories.

ANALYZING THE EVIDENCE

1. How do Sources 1 and 2 differ in how they portray Yaghi Siyan and the man who opened the towers of Antioch to Christian forces? How do these and other differences influence the story?
2. In Sources 3 and 4, how is the course of the two battles for Jerusalem different? How is the aftermath different?
3. How does the artist who painted Source 5 convey his ideas about why the battle ended as it did?

4. How do these accounts balance the various aims — religious devotion, military glory, economic gain — of the two sides?

PUTTING IT ALL TOGETHER

Using the sources above, along with what you have learned in class and in this chapter, write a short essay that analyzes Christian and Muslim views of the Crusades. How did they differ, and how were they similar? How did the Crusades help shape the understanding that Christians and Muslims had of each other?

Consequences of the Crusades

The Crusades testified to the religious enthusiasm of the High Middle Ages and the influence of the papacy, gave kings and the pope opportunities to expand their bureaucracies, and provided an outlet for nobles’ dreams of glory. The Crusades also introduced some Europeans to Eastern luxury goods. They were also a boon to Italian merchants, who profited from outfitting military expeditions as well as from the opening of new trade routes and the establishment of trading communities in the Crusader states.

Despite these advantages, the Crusades had some seriously negative sociopolitical consequences. For one thing, they proved to be a disaster for Jewish-Christian relations. Inspired by the ideology of holy war, Christian armies on their way to Jerusalem on the First Crusade joined with local mobs to attack Jewish families and communities. Later Crusades brought similar violence, enhanced by accusations that Jews engaged in the ritual murder of Christians to use their blood in religious rites.

Legal restrictions on Jews gradually increased throughout Europe. Jews were forbidden to have Christian servants or employees, to hold public office, to appear in public on Christian holy days, or to enter Christian parts of town without a badge marking them as Jews. They were prohibited from engaging in any trade with Christians except money-lending and were banished from England and France.

The long-term cultural legacy of the Crusades may have been more powerful than their short-term impact. The ideal of a sacred mission to conquer or convert Muslim peoples entered some Europeans’ consciousness and was later used in other situations. When in 1492 Christopher Columbus sailed west, he used the language of the Crusades in his diaries, and he hoped to establish a Christian base in India from which a new crusade against Islam could be launched (see “Causes of European Expansion” in Chapter 16). Muslims later looked back on the Crusades as expansionist and imperialist, the beginning of a long trajectory of Western attempts to limit or destroy Islam.

The Life of the People

How did the lives of common people, nobles, and townspeople differ, and what new commercial developments increased wealth?

In the late ninth century medieval intellectuals described Christian society as composed of those who pray (the monks), those who fight (the nobles), and those who work (the peasants). This three-category model does not fully describe medieval society — there were degrees of wealth and status within each group. Also, the model does not take townspeople and the emerging commercial classes into consideration, and it completely excludes those who were not Christian, such as Jews, Muslims, and pagans. Furthermore, those who used the model, generally bishops and other church officials, ignored the fact that each of these groups was made up of both women and men. Despite — or perhaps because of — these limitations, the model of the three categories was a powerful mental construct. Therefore, we can use it to organize our investigation of life in the Middle Ages, broadening it to include groups and issues that medieval authors did not. (See “Christian Monasticism” in Chapter 8 for a discussion of the life of monks and nuns — “those who pray.”)

The Life and Work of Peasants

The men and women who worked the land in medieval Europe made up probably more than 90 percent of the population, as they did in China, India, and other parts of the world where agriculture predominated. The evolution of localized systems of authority into more centralized states had relatively little impact on the daily lives of these peasants except when it involved warfare.

Medieval theologians lumped everyone who worked the land into the category of “those who work,” but in fact there were many levels of peasants, ranging from slaves to free and sometimes very rich farmers. In western Europe most peasants were serfs, required to stay in the village and perform labor on the lord’s land. Serfs were also often obliged to pay fees on common occurrences, such as marriage or inheritance of property.

Serfdom was a hereditary condition. A person born a serf was likely to die a serf, though many serfs did secure their freedom, and the economic revival that began in the eleventh century (see “Towns, Cities, and the Growth of Commercial Interests”) allowed some to buy their freedom. Further opportunities for increased personal freedom came when lords organized groups of villagers to migrate to sparsely settled frontier areas or to cut down forests or fill in swamps so that there was more land available for farming. Those who took on this extra work often gained a reduction in traditional manorial obligations and an improvement of their social and legal conditions.

Agricultural Work In this scene from a German manuscript written about 1190, men and women of different ages are sowing seeds and harvesting grain. All residents of a village, including children, engaged in agricultural tasks.

In the Middle Ages most European peasants, free and unfree, lived in family groups in small villages that were part of a manor, the estate of a lord (see “ ‘Feudalism’ and Manorialism”). The manor was the basic unit of medieval rural organization and the center of rural life. Within the manors of western and central Europe, villages were made up of small houses for individual families, a church, and perhaps the large house of the lord, surrounded by land farmed by the villagers. Peasant households consisted of one married couple, their children, and perhaps one or two other relatives, such as a grandparent or unmarried aunt. In southern and eastern Europe, extended families were more likely to live in the same household or very near one another. Between one-third and one-half of children died before age five, though many people lived into their sixties.

The peasants’ work was typically divided according to gender. Men and boys were responsible for clearing new land, plowing, and caring for large animals; women and girls were responsible for the care of small animals, spinning, and food preparation. Both sexes harvested and planted crops used for food, worked in the vineyards, and harvested and prepared crops needed by the textile industry — flax and plants used for dyeing cloth. Beginning in the eleventh century water mills and windmills aided in some tasks, especially grinding grain, and an increasing use of horses rather than oxen speeded up plowing.

Baking Bread In this fourteenth-century French manuscript, women bake bread in a large oven, using a long wooden paddle to insert the loaves, just as modern pizza bakers do. Medieval families cooked in pots and on spits over fires in their own homes, but rarely had ovens because of the danger of fire. Instead they bought their bread, just as they did beer or ale, another staple of the medieval diet.

The mainstay of the diet for peasants everywhere — and for all other classes — was bread. Peasants also ate vegetables; animals were too valuable to be used for food on a regular basis, but weaker animals were often slaughtered in the fall, and their meat was preserved with salt and eaten on great feast days such as Christmas and Easter. Ale was the universal drink of common people, and it provided needed calories and some relief from the difficult and monotonous labor that filled people’s lives.

The Life and Work of Nobles

The nobility, though a small fraction of the total population, influenced all aspects of medieval culture. Nobles generally paid few taxes, and they had power over the people living on their lands. They maintained order, resolved disputes, and protected their dependents from attacks. They appointed officials who oversaw agricultural production. The liberty and privileges of the noble were inheritable, perpetuated by blood and not by wealth alone.

The nobles' primary obligation was warfare, just as it was for nobles among the Mexica (see "The Aztec Empire" in Chapter 11) and samurai in Japan (see "The Samurai and the Kamakura Shogunate" in Chapter 13). Nobles were also obliged to attend the lord's court on important occasions.

Originally, most knights focused solely on military skills, but around 1200 a different ideal of knighthood emerged, usually termed **chivalry**. Chivalry was a code of conduct in which fighting to defend the Christian faith and protecting one's countrymen was declared to have a sacred purpose. Other qualities gradually became part of chivalry: bravery, generosity, honor, graciousness, mercy, and eventually gallantry toward women, which came to be called "courtly love." (See "Analyzing the Evidence: Courtly Love Poetry," above.) The chivalric ideal — and it was an ideal, not a standard pattern of behavior — created a new standard of masculinity for nobles, in which loyalty and honor remained the most important qualities, but graceful dancing and intelligent conversation were not considered unmanly.

chivalry A code of conduct that was supposed to govern the behavior of a knight.

Noblewomen played a large and important role in the functioning of the estate. They were responsible for managing the household's "inner economy" — cooking, brewing, spinning, weaving, and caring for yard animals. When the lord was away for long periods, his wife became the sole manager of the family properties. Often the responsibilities of the estate fell permanently to her if she became a widow.

ANALYZING THE EVIDENCE

Courtly Love Poetry

Whether female or male, troubadour poets celebrated *fin'amor*, a Provençal word for the pure or perfect love a knight was supposed to feel for his lady, which has in English come to be called "courtly love." In courtly love poetry, the writer praises his or her love object, idealizing the beloved and promising loyalty and great deeds. Most of these songs are written by, or from the perspective of, a male lover who is socially beneath his female beloved; her higher status makes her unattainable, so the lover's devotion can remain chaste and pure, rewarded by her handkerchief, or perhaps a kiss, but nothing more.

Scholars generally agree that poetry praising pure and perfect love originated in the Muslim culture of the Iberian Peninsula, where heterosexual romantic love had long been the subject of poems and songs. Spanish Muslim poets sang at the courts of Christian nobles, and Provençal poets picked up their romantic themes. Other aspects of courtly love are hotly debated. Was it simply a literary convention, or did it shape actual behavior? Did it celebrate adultery, or was true courtly love pure (and unrequited)? How should we interpret medieval physicians' reports of people (mostly young men) becoming gravely ill from "lovesickness"? Were there actually "courts of love" in which women judged lovers based on a system of rules? Did courtly love lead to greater respect for women or toward greater misogyny, as desire for a beloved so often ended in frustration?

It is very difficult to know whether courtly love literature influenced the treatment of real women to any great extent, but it did introduce a new ideal of heterosexual romance into Western literature. Courtly love ideals still shape romantic conventions, and often appear in movies, songs, and novels that explore love between people of different social groups.

The following poem was written by Arnaut Daniel, a thirteenth-century troubadour praised by poets from Dante in the thirteenth century to Ezra Pound in the twentieth. Not much is known about him, but his surviving songs capture courtly love conventions perfectly.

I only know the grief that comes to me,
to my love-ridden heart, out of over-loving,
since my will is so firm and whole
that it never parted or grew distant from her
whom I craved at first sight, and afterwards:
and now, in her absence, I tell her burning words;
then, when I see her, I don't know, so much I have to, what to say.

To the sight of other women I am blind, deaf to hearing them
since her only I see, and hear and heed,
and in that I am surely not a false slanderer,
since heart desires her more than mouth may say;
wherever I may roam through fields and valleys, plains and mountains
I shan't find in a single person all those qualities

which God wanted to select and place in her.

I have been in many a good court,
but here by her I find much more to praise:
measure and wit and other good virtues,
beauty and youth, worthy deeds and fair disport;
so well kindness taught and instructed her
that it has rooted every ill manner out of her:
I don’t think she lacks anything good.

No joy would be brief or short
coming from her whom I endear to guess [my intentions],
otherwise she won’t know them from me,
if my heart cannot reveal itself without words,
since even the Rhone [River], when rain swells it,
has no such rush that my heart doesn’t stir
a stronger one, weary of love, when I behold her.

Joy and merriment from another woman seems false and ill to me,
since no worthy one can compare with her,
and her company is above the others’.
Ah me, if I don’t have her, alas, so badly she has taken me!
But this grief is amusement, laughter and joy,
since in thinking of her, of her am I gluttonous and greedy:
ah me, God, could I ever enjoy her otherwise!

And never, I swear, I have liked game or ball so much,
or anything has given my heart so much joy
as did the one thing that no false slanderer
made public, which is a treasure for me only.
Do I tell too much? Not I, unless she is displeased:
beautiful one, by God, speech and voice
I’d lose ere I say something to annoy you.

And I pray my song does not displease you
since, if you like the music and lyrics,
little cares Arnaut whether the unpleasant ones like them as well.

[Far fewer poems by female trobairitz have survived than by male troubadours, but those that have survived express strong physical and emotional feelings. The following song was written in the twelfth century by the Countess of Dia. She was purportedly the wife of a Provençal nobleman, though biographies of both troubadours and trobairitz were often made up to fit the conventions of courtly love, so we don't know for sure. The words to at least four of her songs have survived, one of them with the melody, which is very rare.]

I've suffered great distress
From a knight whom I once owned.
Now, for all time, be it known:
I loved him — yes, to excess. His jilting I've regretted,
Yet his love I never really returned. Now for my sin I can only burn:
Dressed, or in my bed.

O if I had that knight to caress
Naked all night in my arms,
He'd be ravished by the charm
Of using, for cushion, my breast. His love I more deeply prize
Than Floris did Blancheor's
Take that love, my core, My sense, my life, my eyes!

Lovely lover, gracious, kind,
When will I overcome your fight?
O if I could lie with you one night!
Feel those loving lips on mine! Listen, one thing sets me afire:
Here in my husband's place I want you,
If you'll just keep your promise true: Give me everything I desire.

QUESTIONS FOR ANALYSIS

1. Both of these songs focus on a beloved who does not return the lover's affection. What similarities and differences do you see in them?
2. How does courtly love reinforce other aspects of medieval society? What aspects of medieval society does it contradict?
3. Can you find examples from current popular music that parallel the sentiments expressed in these two songs?

Towns, Cities, and the Growth of Commercial Interests

Most people continued to live in villages in the Middle Ages, but the rise of towns and the growth of a new business and commercial class were central to Europe’s recovery after the disorders of the tenth century. Several factors contributed to this growth: a rise in population; increased agricultural output, which provided an adequate food supply for new town dwellers; and enough peace and political stability to allow merchants to transport and sell goods. In 1100 the largest cities in Europe were most likely Constantinople and Córdoba, each with several hundred thousand residents; only Kaifeng in China was larger. London and Paris were much smaller: Paris had perhaps 50,000 residents and London 20,000.

Towns in western and eastern Europe were generally enclosed by walls, as were towns in China and India. Most towns were first established as trading centers, with a marketplace in the middle, and they were likely to have a mint for coining money and a court for settling disputes. Residents bargained with lords to make the town politically independent, which gave them the right to hold legal courts, select leaders, and set taxes.

Townspeople also tried to acquire liberties, above all personal freedom, for themselves. It gradually developed that an individual who lived in a town for a year and a day, and was accepted by the townspeople, was free of servile obligations and status. Thus serfs who fled their manors for towns and were able to find work and avoid recapture became free of personal labor obligations. In this way the growth of towns contributed to a slow decline of serfdom in western Europe.

Merchants constituted the most powerful group in most towns, and they were often organized into merchant guilds, which prohibited nonmembers from trading, pooled members’ risks, monopolized city offices, and controlled the economy of the town. Towns became centers of production as well, and artisans in particular trades formed their own **craft guilds**. Members of the craft guilds determined the quality, quantity, and price of the goods produced and the number of apprentices and journeymen affiliated with the guild. Formal membership in guilds was generally limited to men, but women often worked in guild shops without official membership.

craft guilds Associations of artisans organized to regulate the quality, quantity, and price of the goods produced as well as the number of affiliated apprentices and journeymen.

Artisans generally made and sold products in their own homes, with production taking place on the ground floor. The family lived above the business on the second or third floor. As the business and the family expanded, additional stories were added.

Most medieval towns and cities developed with little planning or attention to sanitation. Horses and oxen, the chief means of transportation and power, dropped tons of dung on the streets every year. It was universal practice in the early towns to dump household waste, both animal and human, into the road in front of one's house. Despite such unpleasant aspects of urban life, people wanted to get into medieval towns because they represented opportunities for economic advancement, social mobility, and improvement in legal status.

The Expansion of Trade and the Commercial Revolution

The growth of towns went hand in hand with a revival of trade as artisans and craftsmen manufactured goods for local and foreign consumption. As in the city-states of East Africa (see "The East African City-States" in Chapter 10), most trade centered in towns and was controlled by merchants. They began to pool their money to finance trading expeditions, sharing the profits and also sharing the risks.

Italian cities, especially Venice, led the West in trade in general and completely dominated trade with Asia and North Africa, becoming much larger urban communities in the process. Merchants from Florence and Milan were also important traders, and they developed new methods of accounting and record keeping that facilitated the movement of goods and money. The towns of Bruges, Ghent, and Ypres in Flanders were leaders in long-distance trade and built up a vast industry in the manufacture of cloth, aided by ready access to wool from England. The availability of raw wool also encouraged the development of cloth manufacture within England itself.

In much of northern Europe, the Hanseatic League (known as the Hansa for short), a mercantile association of towns formed to achieve mutual security and exclusive trading rights, controlled trade. During the thirteenth century perhaps two hundred cities from Holland to Poland joined the league. In cities such as Bruges and London, Hanseatic merchants secured special concessions exempting them from all tolls and allowing them to trade at local fairs. Hanseatic merchants also established foreign trading centers.

These developments, which began in the eleventh century, added up to what historians of Europe have called the **commercial revolution**, a direct parallel to the economic revolution going on in Song Dynasty China at the same time (see "The Medieval Chinese Economic Revolution" in Chapter 13). In giving the transformation this name, historians point not only to an increase in the sheer volume of trade and in the complexity and sophistication of business procedures but also to the new attitude toward business and making money. Some even detect a "capitalist spirit" in which making a profit was regarded as a good thing in itself.

commercial revolution The transformation of the economic structure of Europe, beginning in the eleventh century, from a rural, manorial society to a more complex mercantile society.

The commercial revolution created a great deal of new wealth, which did not escape the attention of kings and other rulers. Wealth could be taxed, and through taxation kings could create strong and centralized states. Through the activities of merchants, Europeans again saw products from Africa and Asia in city marketplaces, as they had in Roman times. The commercial revolution also provided the opportunity for thousands of serfs in western Europe to improve their social position.

Learning and Culture

What were the primary educational and cultural developments in medieval Europe?

The towns that became centers of trade and production in the High Middle Ages also developed into cultural and intellectual centers. Trade brought in new ideas as well as merchandise, and in many cities a new type of educational institution — the university — emerged. As universities appeared, so did other cultural advancements, such as new forms of architecture and literature.

Universities and Scholasticism

Since the time of the Carolingian Empire, monasteries and cathedral schools had offered the only formal instruction available. In the eleventh century in Bologna and other Italian cities, wealthy businessmen established municipal schools; in the twelfth century municipal schools in Italy and cathedral schools in France and Spain developed into much larger universities, a transformation parallel to the opening of madrasas in Muslim cities (see “Education and Intellectual Life” in Chapter 9).

The growth of the University of Bologna coincided with a revival of interest in Roman law. The study of Roman law as embodied in Justinian’s Code (see “Justinian’s Code of Law” in Chapter 8) had never completely died out in the West, but in the eleventh century the discovery of a complete manuscript of the code in a library in northern Italy led scholars to study and teach Roman law intently.

At the Italian city of Salerno, interest in medicine had persisted for centuries. Greek and Muslim physicians there had studied the use of herbs as cures and had experimented with surgery. The twelfth century ushered in a new interest in Greek medical texts and in the work of Arab and Greek doctors. Ideas from this medical literature spread throughout Europe from Salerno and became the basis of training for physicians at other medieval universities. University training gave physicians high social status and allowed them to charge high fees, although their diagnoses and treatments were based on classical theories, not on interactions with patients.

Lecture at the University of Paris Students with somewhat dour expressions take notes while the professor lectures from a book, in this illustration from a history of France made about 1400.

Although medicine and law were important academic disciplines in the Middle Ages, theology was "the queen of sciences." Paris became the place to study theology, and in the first decades of the twelfth century students from all over Europe crowded into the cathedral school of Notre Dame in that city.

University professors were known as "schoolmen" or **Scholastics**. They developed a method of thinking, reasoning, and writing in which questions were raised and authorities cited on both sides of a question. The goal of the Scholastic method was to arrive at definitive answers and to provide a rational explanation for what was believed on faith.

Scholastics Medieval professors who developed a method of thinking, reasoning, and writing in which questions were raised and authorities cited on both sides of a question.

One of the most famous Scholastics was Peter Abelard (1079–1142). Fascinated by logic, Abelard used a method of systematic doubting in his writing and teaching. Abelard was censured by a church council, but he was highly popular with students.

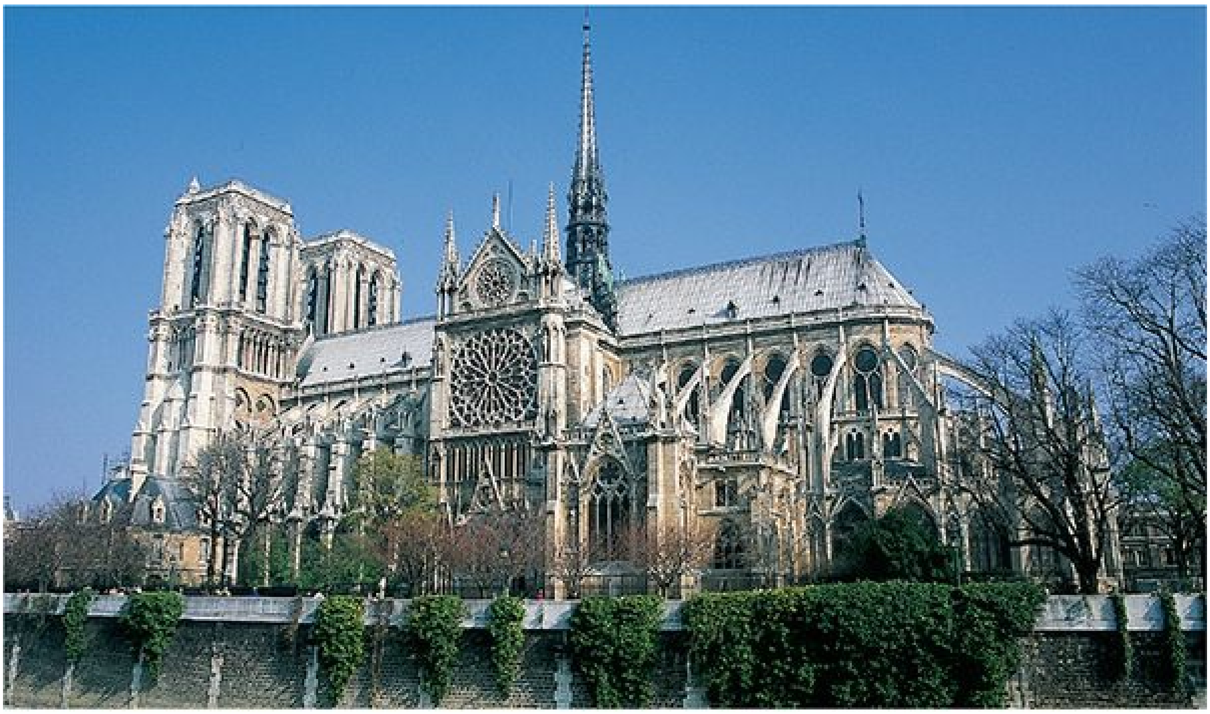
Thirteenth-century Scholastics devoted an enormous amount of time to collecting and organizing knowledge on all topics. These collections were published as summae (SOO-may), or reference books. Thomas Aquinas (1225–1274), a professor at the University of Paris, produced the most famous collection, the *Summa Theologica*, which deals with a vast number of theological questions.

Students lived in privately endowed residential colleges and were considered to be lower-level members of the clergy, so that any student accused of a crime was tried in church, rather than in city, courts. This clerical status, along with widely held ideas about women’s lesser intellectual capabilities, meant that university education was restricted to men.

At all universities the standard method of teaching was the lecture. With this method the professor read a passage from the Bible, Justinian’s Code, or one of Aristotle’s treatises. He then explained and interpreted the passage. Examinations were given after three, four, or five years of study, when the student applied for a degree. If the candidate passed, he was awarded the first, or bachelor’s, degree. Further study enabled the graduate to try for the master’s and doctor’s degrees. Degrees were technically licenses to teach. Most students, however, did not become teachers. They staffed the expanding royal and papal administrations.

Cathedrals and a New Architectural Style

Religious devotion was expressed through rituals and institutions, but people also wanted permanent visible representations of their piety, and both church and city leaders wanted physical symbols of their wealth and power. These aims found their outlet in the building of tens of thousands of churches, chapels, abbeys, and, most spectacularly, cathedrals.



David R. Frazier/Science Source

Notre Dame Cathedral, Paris, Begun 1163 This view offers a fine example of the twin towers (left), the spire, the great rose window over the south portal (center), and the flying buttresses that support the walls and the vaults. Like hundreds of other churches in medieval Europe, it was dedicated to the Virgin Mary. With a spire rising more than 300 feet, Notre Dame was the tallest building in Europe at the time of its construction.

In the tenth and eleventh centuries cathedrals were built in a style that resembled ancient Roman architecture, with massive walls, rounded stone arches, and small windows — features later labeled Romanesque. In the twelfth century a new artistic and architectural style spread out from central France. It was dubbed **Gothic** by later Renaissance architects. The basic features of Gothic architecture — pointed arches, high ceilings, and exterior supports called flying buttresses that carried much of the weight of the roof — allowed unprecedented interior light. Stained-glass windows were cut into the stone. Between 1180 and 1270 in France alone, eighty cathedrals, about five hundred abbey churches, and tens of thousands of parish churches were constructed in this new style. They are testimony to the deep religious faith and piety of medieval people and also to the civic pride of urban residents, for towns competed with one another to build the largest and most splendid cathedral. Through its statuary, paintings, and stained-glass windows, the cathedral was designed to teach the people the doctrines of Christian faith through visual images, though these also often showed scenes from the lives of the artisans and merchants who paid for them.

Vernacular Literature and Drama

Latin was the language used in university education, scholarly writing, and works of literature. By the High Middle Ages, however, no one spoke Latin as his or her first language. The barbarian invasions, the mixture of peoples, and the usual changes in language that occurred over time resulted in a variety of local dialects that blended words and linguistic forms in various ways.

In the High Middle Ages, some authors departed from tradition and began to write in their local dialect, that is, in the everyday language of their region, which linguistic historians call the vernacular. This new **vernacular literature** gradually transformed some local dialects into literary languages, such as French, German, Italian, and English, while other local dialects, such as Breton and Bavarian, remained means of oral communication.

vernacular literature Literature written in the everyday language of a region rather than Latin; this included French, German, Italian, and English.

Stories and songs in the vernacular were composed and performed at the courts of nobles and rulers. In southern Europe, especially in Provence in southern France, poets who called themselves troubadours wrote and sang lyric verses celebrating love, desire, beauty, and gallantry. Troubadours included a few women, with their poetry often chiding knights who did not live up to the ideal. (See “Analyzing the Evidence: Courtly Love Poetry,” page 390.) The songs of the troubadours were widely imitated in Italy, England, and Germany, so they spurred the development of vernacular literature there as well. Drama, derived from the church’s liturgy, also emerged as a distinct art form. Actors performed plays based on biblical themes and on the lives of the saints; these dramas were presented in the towns, first in churches and then at the marketplace. By combining comical farce based on ordinary life with serious religious scenes, plays gave ordinary people an opportunity to identify with religious figures and think about their faith.

Beginning in the fourteenth century a variety of evidence attests to the increasing literacy of laypeople. Wills and inventories reveal that many people, not just nobles, possessed books — mainly devotional texts, but also romances, manuals on manners and etiquette, histories, and sometimes legal and philosophical texts. The spread of literacy represents a response to the needs of an increasingly complex society.

Crises of the Later Middle Ages

Why have the later Middle Ages been seen as a time of calamity and crisis?

Between 1300 and 1450 Europeans experienced a series of shocks: climate change, economic decline, plague, war, social upheaval, and increased crime and violence. Death and preoccupation with death made the fourteenth century one of the most wrenching periods of history in Europe and western Asia.

The Great Famine and the Black Death

In the first half of the fourteenth century the Northern Hemisphere experienced a series of climate changes, especially the beginning of a period of colder and wetter weather that historical geographers label the "little ice age." Its effects were dramatic and disastrous. Population had steadily increased in the twelfth and thirteenth centuries, but with colder weather, poor harvests led to scarcity and starvation. The costs of grain, livestock, and dairy products rose sharply. Almost all of northern Europe suffered a terrible famine between 1315 and 1322, with dire social consequences: peasants were forced to sell or mortgage their lands for money to buy food, and the number of homeless people greatly increased, as did petty crime. An undernourished population was dealt a further blow in 1347 in the form of a virulent new disease, later called the **Black Death** (Map 14.3). The symptoms of this disease were first described in 1331 in southwestern China, then part of the Mongol Empire (see "The Spread of Disease, Goods, and Ideas" in Chapter 12). From there it spread across Central Asia by way of Mongol armies and merchant caravans, arriving in the ports of the Black Sea by the 1340s. It then spread to Constantinople and Alexandria, and within a year it was in Mecca, Damascus, Tunis, Genoa, and Venice. From Italy it traveled farther in all directions, in several waves.

MAP 14.3 The Course of the Black Death in Fourteenth-Century Europe The plague followed trade routes as it spread into and across Europe. A few cities that took strict quarantine measures were spared.

DNA evidence taken from the tooth sockets of skeletons in mass graves in England, France, and the Netherlands indicates that the disease that spread in the fourteenth century was the bubonic plague, caused by a variant of the bacillus *Yersinia pestis*, the same bacillus that had caused the Justinian Plague in the sixth century (see “The Byzantine Empire” in Chapter 8). The disease normally afflicts rats. Fleas living on the infected rats drink their blood and pass the bacteria that cause the plague on to the next rat they bite. Usually the disease is limited to rats and other rodents, but at certain points in history the fleas have jumped from their rodent hosts to humans and other animals. The disease had dreadful effects on the body, including growths in the armpit, groin, or neck; black spots or blotches caused by bleeding under the skin; and violent coughing and spitting blood, which were followed by death in two or three days.

At the time, most people believed that the Black Death was caused by poisons or by “corrupted air” that carried the disease from place to place. They sought to keep poisons from entering the body by smelling or ingesting strong-smelling herbs, and they tried to remove the poisons through bloodletting. They also prayed and did penance. Anxiety and fears about the plague caused people to look for scapegoats, and they found them in the Jews, who they believed had poisoned the wells of Christian communities and thereby infected the drinking water. This charge led to the murder of thousands of Jews across Europe.

Procession of Flagellants In this manuscript illumination from 1349, shirtless flagellants, men and women who whipped and scourged themselves as penance for their and society's sins, walk through the Flemish city of Tournai, which had just been struck by the plague. Many people believed that the Black Death was God's punishment for humanity's wickedness.

Historians estimate that across Europe the plague killed about one-third of the population, with some places suffering even higher losses. Of a total English population of perhaps 4.2 million, probably 1.4 million died of the Black Death in its several visits. In Italy densely populated cities endured incredible losses. Florence lost between one-half and two-thirds of its population when the plague visited in 1348. The disease recurred intermittently in the 1360s and 1370s and reappeared many times, as late as the early 1700s in Europe.

In the short term the economic effects of the plague were severe because the death of many peasants disrupted food production. But in the long term the dramatic decline in population eased pressure on the land, and wages and per capita wealth rose for those who survived. The psychological consequences of the plague were profound. (See "Global

Viewpoints: Italian and English Views of the Plague,” page 398.) Some people sought release in wild living, while others turned to the severest forms of asceticism and frenzied religious fervor.

GLOBAL VIEWPOINTS

Italian and English Views of the Plague

Eyewitness commentators on the plague include the Italian writer Giovanni Boccaccio (1313–1375), who portrayed the course of the disease in Florence in the preface to his book of tales, *The Decameron*, and the English monastic chronicler Henry Knighton (d. 1396), who described the effects of the plague on English towns and villages in his four-volume chronicle of English history.

Giovanni Boccaccio

■ Against this pestilence no human wisdom or foresight was of any avail…. Men and women in great numbers abandoned their city, their houses, their farms, their relatives, and their possessions and sought other places, going at least as far away as the Florentine countryside — as if the wrath of God could not pursue them with this pestilence wherever they went but would only strike those it found within the walls of the city! … Almost no one cared for his neighbor, and relatives hardly ever visited one another — they stayed far apart. This disaster had struck such fear into the hearts of men and women that brother abandoned brother, uncle abandoned nephew, sister left brother, and very often wife abandoned husband, and — even worse, almost unbelievable — fathers and mothers neglected to tend and care for their children as if they were not their own…. So many corpses would arrive in front of a church every day and at every hour that the amount of holy ground for burials was certainly insufficient for the ancient custom of giving each body its individual place; when all the graves were full, huge trenches were dug in all the cemeteries of the churches and into them the new arrivals were dumped by the hundreds…. Oh how many great palaces, beautiful homes and noble dwellings, once filled with families, gentlemen, and ladies, were now emptied, down to the last servant!

Henry Knighton

■ Then that most grievous pestilence penetrated the coastal regions [of England] by way of Southampton, and came to Bristol, and people died as if the whole strength of the city were seized by sudden death. For there were few who lay in their beds more than three days or two and half days; then that savage death snatched them about the second day. In Leicester, in the little parish of St. Leonard, more than three hundred and eighty died; in the parish of Holy Cross, more than four hundred…. And so in each parish, they died in great numbers…. At the same time, there was so great a lack of priests everywhere that many churches had no divine services…. One could hardly hire a chaplain to minister to the church for less than ten marks…. Meanwhile, the king ordered that in every county of the kingdom, reapers and other labourers should not receive more than they were accustomed to receive, under the penalty provided in the statute, and he renewed the statute at this time. The labourers, however, were so arrogant and hostile that they did not heed the king’s command, but if anyone wished to hire them, he had to pay them what they wanted, and either lose his fruits and crops or satisfy the arrogant and greedy desire of the labourers as they wished…. Similarly, those who received day-work from their tenants throughout the year, as is usual from serfs, had to release them and to remit such service. They either had to excuse them entirely or had to fix them in a laxer manner at a small rent, lest very great and irreparable damage be done to the buildings and the land everywhere remain uncultivated.

QUESTIONS FOR ANALYSIS

1. How did the residents of Florence respond to the plague, as described by Boccaccio?
2. What were some of the effects of the plague in England, as described by Knighton?
3. How might the fact that Boccaccio was writing in an urban setting and Knighton was writing from a rural monastery that owned a large amount of land have shaped their perspectives?

The Hundred Years’ War

While the plague ravaged populations in Asia, North Africa, and Europe, a long international war in western Europe added further death and destruction. England and France had engaged in sporadic military hostilities from the time of the Norman Conquest in 1066 (see “The Restoration of Order”), and in the middle of the fourteenth century these became more intense. From 1337 to 1453 the two countries intermittently fought one another in what was the longest war in European history, ultimately dubbed the Hundred Years’ War, though it actually lasted 116 years.

The Hundred Years’ War had a number of causes. Both England and France claimed the duchy of Aquitaine in southwestern France, and the English king Edward III argued that, as the grandson of an earlier French king, he should have rightfully inherited the French throne. Nobles in provinces on the borders of France who were worried about the growing power of the French king supported Edward, as did wealthy wool merchants and clothmakers in Flanders who depended on English wool. The governments of both England and France promised wealth and glory to those who fought, and each country portrayed the other as evil.

The war, fought almost entirely in France, consisted mainly of a series of random sieges and raids. During the war’s early stages, England was successful, primarily through the use of longbows fired by well-trained foot soldiers against mounted knights and, after 1375, by early cannon. By 1419 the English had advanced to the walls of Paris. But the French cause was not lost. Though England scored the initial victories, France won the war.

The ultimate French success rests heavily on the actions of Joan, an obscure French peasant girl whose vision and military leadership revived French fortunes and led to victory. Born in 1412 to well-to-do peasants, Joan grew up in a pious household. During adolescence she began to hear voices, which she later said belonged to Saint Michael, Saint Catherine, and Saint Margaret. In 1428 these voices told her that the dauphin of France — Charles VII, who was uncrowned as king because of the English occupation — had to be crowned and the English expelled from France. Joan went to the French court and secured the support of the dauphin to travel, dressed as a knight, with the French army to the besieged city of Orléans.

At Orléans, Joan inspired and led French attacks, and the English retreated. As a result of her successes, Charles made Joan co-commander of the entire army, and she led it to a string of military victories in the summer of 1429. Two months after the victory at Orléans, Charles VII was crowned king at Reims.

Joan and the French army continued their fight against the English. In 1430 England’s allies, the Burgundians, captured Joan and sold her to the English, and the French did not intervene. The English wanted Joan eliminated for obvious political reasons, but the primary charge against her was heresy, and the trial was conducted by church authorities. She was interrogated about the angelic voices and about why she wore men’s clothing. She apparently answered skillfully, but in 1431 she was condemned as a heretic and burned at the stake in the marketplace at Rouen. The French army continued its victories without her, and demands for an end to the war increased among the English, who were growing tired of the mounting loss of life and the flow of money into a seemingly bottomless pit. Slowly the French reconquered Normandy and finally ejected the English from Aquitaine. At the war’s end in 1453, only the town of Calais remained in English hands.

The long war had a profound impact on the two countries. In England and France the war promoted nationalism. It led to technological experimentation, especially with gunpowder weaponry, whose firepower made the protective walls of stone castles obsolete. The war also stimulated the development of the English Parliament. Edward III’s constant need for money to pay for the war compelled him to summon it many times, and its representatives slowly built up their powers.

Suit of Armor This fifteenth-century suit of Italian armor protected its wearer, but its weight made movement difficult. Both English and French mounted knights wore full armor at the beginning of the Hundred Years' War, but by the end they wore only breastplates and helmets, which protected their vital organs but allowed greater mobility. This suit has been so well preserved that it was most likely never used in battle; it may have been made for ceremonial purposes.

Challenges to the Christian Church

In times of crisis or disaster people of all faiths have sought the consolation of religion, but in the fourteenth century the official Western Christian Church offered little solace. While local clergy eased the suffering of many, a dispute over who was the legitimate pope weakened the church as an institution. In 1309 pressure by the French monarchy led the pope to move his permanent residence to Avignon in southern France. This marked the start of seven successive papacies in Avignon. Not surprising, all these popes were French — a matter of controversy among church followers outside France. Also, the popes largely concentrated on bureaucratic and financial matters to the exclusion of spiritual objectives.

In 1376 one of the French popes returned to Rome, and when he died there several years later Roman citizens demanded an Italian pope who would remain in Rome. The cardinals elected Urban VI, but soon regretted their decision. The cardinals slipped away from Rome and declared Urban's election invalid because it had come about under threats from the Roman mob. They elected a French cardinal who took the name Clement VII (pontificate 1378–1394) and set himself up at Avignon in opposition to Urban. There were thus two popes, a situation that was later termed the Great Schism.

The Great Schism, 1378–1417

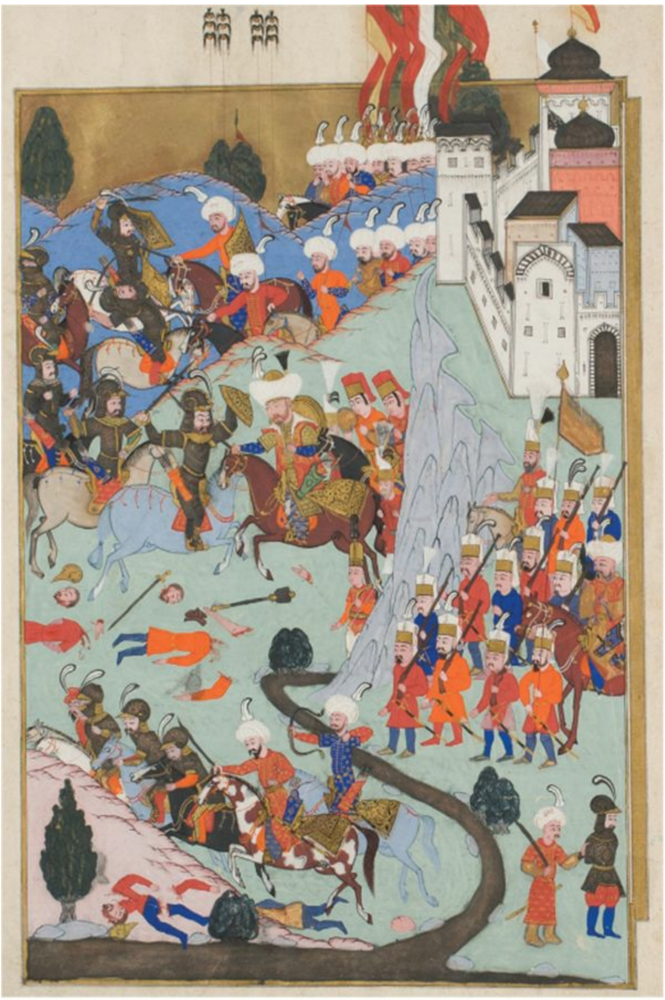
The powers of Europe aligned themselves with Urban or Clement along strictly political lines. France recognized the Frenchman, Clement; England recognized Urban. The rest of Europe lined up behind one or the other. In all European countries the common people were thoroughly confused about which pope was legitimate. In the end the schism weakened the religious faith of many Christians and brought church leadership into serious disrepute.

A first attempt to heal the schism led to the installation of a third pope and a threefold split, but finally a church council meeting at Constance (1414–1418) successfully deposed the three schismatic popes and elected a new leader, who took the name Martin V (pontificate 1417–1431). In the later fifteenth century the papacy concentrated on building up its wealth and political power in Italy rather than on the concerns of the whole church. As a result, many people decided that they would need to rely on their own prayers and pious actions rather than on the institutional church for their salvation.

The primary challenge facing the Orthodox Church was the expansion of the Turks. In the fourteenth century the Ottoman Turks, who were Sunni Muslim, expanded their rule beyond Anatolia to conquer most of the Balkans, defeating Christian armies. (See Map 9.2 and “Analyzing the Evidence: The Battle of Nicopolis” at right.) They besieged Constantinople many times, and in 1453 were successful, ending the Byzantine Empire. Christianity was no longer the state religion, but the patriarchate of Constantinople actually became more powerful, as the patriarchs were given civil and religious authority over all Christians in the expanding Ottoman Empire. The official religion was Islam, but Christians and Jews were largely free to practice their own religion; they paid higher taxes, however, so there were advantages to converting. The Ottoman Empire was mixed in terms of religion, language, and ethnicity and became a haven for Muslims and Jews fleeing discrimination that resulted from the reconquista in the Iberian Peninsula (see “The Expansion of Western and Eastern Christianity”).

ANALYZING THE EVIDENCE

The Battle of Nicopolis



Worcester Art Museum/Bridgeman Images

By the early 1390s the Ottomans had conquered most of the Balkans except for the area right around Constantinople and were moving toward Hungary. King Sigismund of Hungary sent a delegation to the king of France asking for help in “protecting Christianity,” and the pope proclaimed a crusade against the Ottomans. France and England had just made one of the periodic truces during the Hundred Years’ War, so French nobles responded enthusiastically to this opportunity to show off their prowess. Several thousand knights, foot soldiers, and archers — mostly Frenchmen but also some Germans, Poles, Spaniards, and others — traveled over land through the Holy Roman Empire, met up with Sigismund and his troops in Buda, and then marched down the Danube River into Turkish-held territory, pillaging and plundering as they went. The Venetians sent a naval fleet in support. The army besieged the fortress of Nicopolis, a key stronghold high on cliffs above the Danube, while the Turkish commander waited for Sultan Bayezid I and his forces to come to his aid. They did, and the Ottomans attacked the French/Hungarian army on September 25, 1396. The desire for glory, jealousies among the leaders, and a lack of planning among the French/Hungarian forces led to a complete rout, and thousands of troops were killed or captured by the Ottomans, though King Sigismund escaped. Some of the captives were executed, in retaliation for an earlier French execution of Turkish prisoners, but the nobles among them were held for ransom, and a few made it back to France several years later. Because the battle was so significant, it became the stuff of legend on both sides, with wildly inflated numbers of troops reported in chronicles, and Sultan Bayezid later dubbed "the Thunderbolt."

Both European and Turkish artists also depicted the battle in woodcuts, prints, and manuscript illustrations. The watercolor shown here, by the Ottoman court painter Nakkas Osman, comes from the *Hunernama*, an illustrated history written by the court historian Seyyid Lokman in 1588. Although it was produced nearly two hundred years after the battle, this painting is regarded as more accurate than many others, which include gunpowder weaponry that would not have been available at the time and large siege machines that the French/Hungarian army never used. The painting depicts the fortress of Nicopolis on the high cliffs at the upper right, armored French cavalry and foot soldiers at the left, and Ottoman cavalry and footsoldiers in turbans and high hats in the middle, led by Sultan Bayezid, who is right in the center. At the lower right, an Ottoman soldier leads a French captive away.

QUESTIONS FOR ANALYSIS

1. How does the artist show that this was a total defeat?
2. How does the artist contrast the discipline of the Ottoman troops with the disorder of the French/Hungarian army?
3. This painting appeared in an official court history for a later Ottoman sultan. How might the position of Bayezid in the painting have appealed to later rulers? Can you think of other examples of paintings of battles that also show leaders in a prominent position?

Peasant and Urban Revolts

The difficult conditions of the fourteenth and fifteenth centuries spurred a wave of peasant and urban revolts across Europe. In 1358, when French taxation for the Hundred Years' War fell heavily on the poor, the frustrations of the French peasantry exploded in a massive uprising called the Jacquerie (zhah-kuh-REE). Adding to the anger over taxes was the toll taken by the plague and by the famine that had struck some areas. Artisans, small merchants, and parish priests joined the peasants, and residents of both urban and rural areas committed terrible destruction. For several weeks the nobles were on the defensive, until the upper class united to repress the revolt with merciless ferocity.

Taxes and other grievances also led to the 1381 English Peasants' Revolt, involving tens of thousands of people. The Black Death had dramatically reduced the supply of labor, and peasants had demanded higher wages and fewer manorial obligations. Parliament countered with a law freezing wages and binding workers to their manors. The atmosphere of discontent was further enhanced by popular preachers who proclaimed that great disparities between rich and poor went against Christ's teachings. Moreover, decades of aristocratic violence, much of it perpetrated against the weak peasantry, had bred hostility and bitterness.

In 1380 Parliament imposed a poll tax on all citizens to fund the Hundred Years' War. This tax imposed a greater burden on the poor than on wealthier citizens, and it sparked revolt. The boy-king Richard II (r. 1377–1399) met the leaders of the revolt, agreed to charters ensuring the peasants' freedom, tricked them with false promises, and then proceeded to crush the uprising with terrible ferocity. The nobility tried to use this defeat to restore the labor obligations of serfdom, but they were not successful, and the conversion to money rents continued. In Flanders, France, and England peasant revolts often blended with conflicts involving workers in cities. Unrest also occurred in Italian, Spanish, and German cities. In Florence in 1378 the *ciompi*, or poor propertyless wool workers, revolted and briefly shared government of the city with wealthier artisans and merchants. Rebellions and uprisings everywhere revealed deep peasant and worker frustration with the socioeconomic conditions of the time.

Chapter Summary

Invasions by Vikings, Magyars, and Muslims, along with civil wars, created instability in the ninth and tenth centuries. Local nobles became the strongest powers against external threats, establishing a form of decentralized government later known as feudalism. By the twelfth century rulers in some parts of Europe had reasserted authority and were beginning to develop new institutions of government and legal codes that enabled them to assert power over lesser lords and the general population. The papacy also consolidated its power, though these moves were sometimes challenged by kings and emperors. Monasteries continued to be important places for learning and devotion, and new religious orders were founded. A papal call to retake the holy city of Jerusalem led to the Crusades.

The vast majority of medieval Europeans were peasants who lived in small villages and worked their own and their lord’s land. Nobles were a tiny fraction of the total population, but they exerted great power over all aspects of life. Medieval towns and cities grew initially as trading centers and then became centers of production.

Towns also developed into cultural and intellectual centers, as trade brought in new ideas as well as merchandise. Universities offered courses of study based on classical models, and townspeople built churches and cathedrals as symbols of their Christian faith and their civic pride. New types of vernacular literature arose in which poems, songs, and stories were written down in local dialects.

In the fourteenth century a worsening climate brought poor harvests, which contributed to an international economic depression and fostered disease. The Black Death caused enormous population losses and social, psychological, and economic consequences. Additional difficulties included the Hundred Years’ War, a schism among rival popes that weakened the Western Christian Church, and peasant and worker frustrations that exploded into uprisings.

CONNECTIONS

The Middle Ages continues to fascinate us today. We go to medieval fairs; visit castle-themed hotels; watch movies about knights and their conquests; play video games in which we become warriors, trolls, or sorcerers; and read stories with themes of great quests set in the Middle Ages. Characters from other parts of the world often heighten the exoticism: a Muslim soldier joins the fight against a common enemy, a Persian princess rescues the hero and his sidekick, a Buddhist monk teaches martial arts techniques. These characters from outside Europe are fictional, but they also represent aspects of reality because medieval Europe was not isolated, and political and social structures similar to those in western and eastern Europe developed elsewhere.

In reality few of us would probably want to live in the real Middle Ages, when most people worked in the fields all day and even wealthy lords lived in damp and drafty castles. We do not really want to return to a time when one-third to one-half of all children died before age five and alcohol was the only real pain reliever. But the contemporary appeal of the Middle Ages is an interesting phenomenon, particularly because it stands in such sharp contrast to the attitude of educated Europeans who lived in the centuries immediately afterward. They were the ones who dubbed the period “middle.” They saw their own era as the one to be celebrated, and the Middle Ages as best forgotten.

Review the Main Ideas

Answer the focus questions from each section of the chapter.

1. How did medieval rulers restore order and centralize political power? (p. 376)
2. How did the Christian Church enhance its power and create new institutions and religious practices? (p. 379)
3. What were the causes, course, and consequences of the Crusades? (p. 384)
4. How did the lives of common people, nobles, and townspeople differ, and what new commercial developments increased wealth? (p. 388)
5. What were the primary educational and cultural developments in medieval Europe? (p. 393)
6. Why have the later Middle Ages been seen as a time of calamity and crisis? (p. 395)

Make Comparisons and Connections

Analyze the larger developments and continuities within and across chapters.

1. What similarities and differences do you see between the institutions and

laws established by medieval European rulers discussed in this chapter and those of the Roman (Chapter 6), Byzantine (Chapter 8), and Chinese (Chapter 13) emperors?

2. What factors over the centuries enabled the Christian Church (Chapters 6, 8, 14) to become the most powerful and wealthy institution in Europe, and what problems did this create?
3. How would you compare the role of trade in economic development in the Islamic world (Chapter 9), Africa (Chapter 10), Southeast Asia (Chapter 12), China (Chapter 13), and Europe in the period from 800 to 1400?

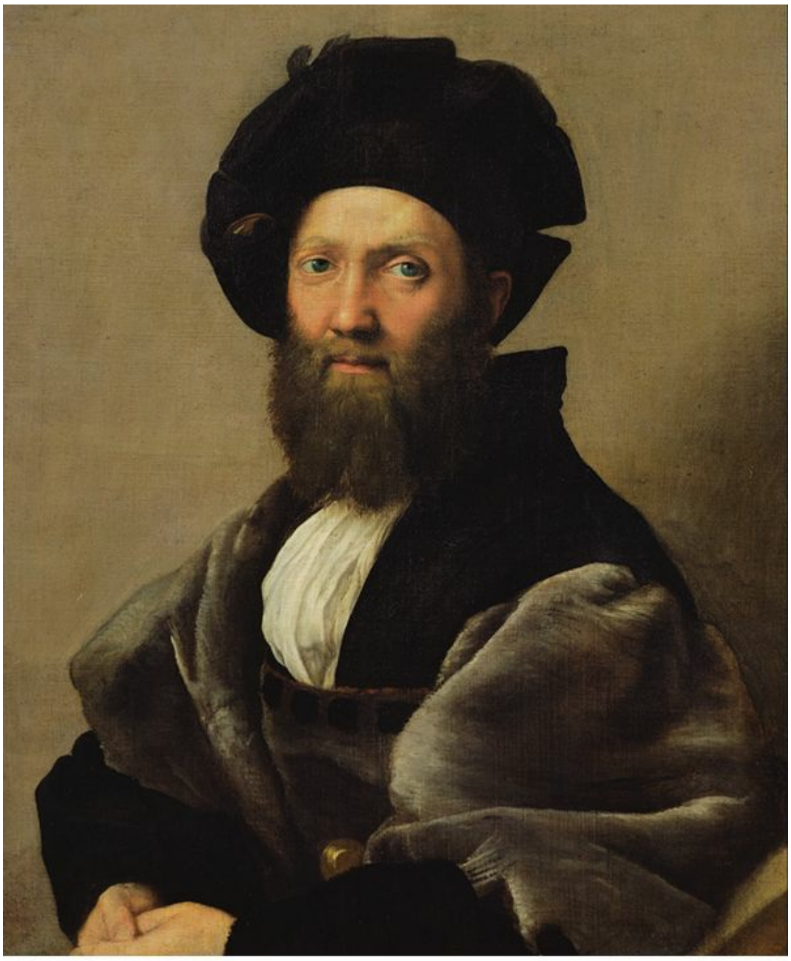
Europe in the Renaissance and Reformation

1350–1600



Louvre, Paris, France/Bridgeman Images

Portrait of Baldassare Castiglione

The author and courtier Baldassare Castiglione

directs his calm gaze toward the viewer in this portrait by the renowned Italian Renaissance artist Raphael. Individual portraits like this one expressed the ideals of the Renaissance: elegance, balance, proportion, and self-awareness.

While disease, famine, and war marked the fourteenth century in much of Europe, the era also witnessed the beginnings of remarkable changes in many aspects of intellectual and cultural life. First in Italy and then elsewhere, artists and writers thought that they were living in a new golden age, later termed the Renaissance, French for “rebirth.” The word *Renaissance* was used initially to describe art that seemed to recapture, or perhaps even surpass, the glories of the classical past and then came to be used for many aspects of life of the period. The new attitude diffused slowly out of Italy, with the result that the Renaissance “happened” at different times in different parts of Europe. It shaped the lives of Europe’s educated elites, although families, kin networks, religious beliefs, and the rhythms of the agricultural year still remained important.

Religious reformers carried out even more dramatic changes. Calls for reform of the Christian Church began very early in its history and continued throughout the Middle Ages. In the sixteenth century these calls gained wide acceptance, due not only to religious issues and problems within the church but also to political and social factors. In a movement termed the Protestant Reformation, Western Christianity broke into many divisions, a situation that continues today. The Renaissance and the Reformation were very different types of movements, but both looked back to a time people regarded as purer and better than their own, and both offered opportunities for strong individuals to shape their world in unexpected ways. Both have also been seen as key elements in the creation of the “modern” world.

Renaissance Culture

What were the major cultural developments of the Renaissance?

The **Renaissance** (ca. 1350–1520) was characterized by self-conscious awareness among fourteenth- and fifteenth-century Italians, particularly scholars and writers known as humanists, that they were living in a new era. Their ideas influenced education and were spread through the new technology of the printing press. Interest in the classical past and in the individual also shaped Renaissance art in terms of style and subject matter.

Renaissance A French word meaning "rebirth," used to describe a cultural movement that began in fourteenth-century Italy and looked back to the classical past.

Wealth and Power in Renaissance Italy

Economic growth laid the material basis for the Italian Renaissance and its cultural achievements. Ambitious merchants gained political power to match their economic power and then used their money to buy luxuries and hire talent in a **patronage** system. Through this system, cities, groups, and individuals commissioned writers and artists to produce specific works or works in specific styles. Thus economics, politics, and culture were interconnected.

patronage Financial support of writers and artists by cities, groups, and individuals, often to produce specific works or works in specific styles.

The Renaissance began in the northern Italian city of Florence, which possessed enormous wealth as a consequence of its domination of European banking. Banking profits allowed elite families to control the city's politics and culture. Although Florence was officially a republic, starting in 1434 the great Medici (MEH-duh-chee) banking family held power almost continually until 1737. They supported an academy for scholars and a host of painters, sculptors, poets, and architects. (See "Individuals in Society: Cosimo and Lorenzo de' Medici," at right.)

Italian States, 1494

In other Italian cities as well, wealthy merchants and bankers built magnificent palaces and became patrons of the arts, hiring not only architects to design and build these palaces but also artists to fill them with paintings and sculptures, and musicians and composers to fill them with music. Attractions like these appealed to the rich, social-climbing residents of Venice, Florence, Genoa, and Rome, who came to see life more as an opportunity for enjoyment than as a painful pilgrimage to Heaven.

This cultural flowering took place amid political turmoil. In the fifteenth century five powers dominated the Italian peninsula: Venice, Milan, Florence, the Papal States, and the kingdom of Naples. These powers competed furiously for territory and tried to extend their authority over smaller city-states. Whenever one Italian state appeared to gain a predominant position within the peninsula, other states combined to establish a balance of power against the threat, thereby preventing long-term political consolidation.

This division facilitated outside invasions of Italy. These began in 1494 as Italy became the focus of international ambitions and the battleground of foreign armies, and Italian cities suffered severely from continual warfare for decades. Thus the failure of the city-states to form some type of federal system — or at least to establish a common foreign policy — led to centuries of subjugation by outside invaders. Italy was not to achieve unification until 1870.

INDIVIDUALS IN SOCIETY

Cosimo and Lorenzo de' Medici

Botticelli's *Adoration of the Magi* shows many members of the Medici family and their circle, including the artist himself at the far right.

THE RENAISSANCE IS OFTEN DESCRIBED AS A TIME OF growing individualism, a development evidenced in the era's many personal portraits and individual biographies. But a person's family also remained important, even for those at the very top of society. The Medici of Florence were one of Europe's wealthiest families and used their money to influence politics and culture. The Medici got their start in banking in the late fourteenth century, with smart bets on what would happen politically in turbulent Italy and the adoption of the best new business practices. By the early fifteenth century the Medici bank had branches in Rome, Pisa, London, and other important European cities, and it served as the pope's primary banker.

Cosimo (1389–1464) and his grandson Lorenzo (1449–1492) were the most influential Medici. Not content simply with great wealth, Cosimo operated behind the scenes to gain control of the Florentine political system, although officially the city remained a republic. Worries about his growing power led the dominant faction of the Florentine city council to exile him, but he took his money and his business with him and was soon asked to return. Cosimo supported artists and thinkers, sponsoring what became known as the Platonic Academy, an informal group of Florence's cultural elite named in honor of

Plato's famous academy in ancient Athens. Here Marsilio Ficino and other humanists translated Plato's works into Latin, making Greek learning available to a much wider European audience. Cosimo collected books and manuscripts from all over Europe, assembling an impressive library within the equally impressive Medici palace that he built in the heart of Florence.

Like his grandfather, Lorenzo was the head of the Medici bank and the de facto ruler of Florence. He, too, survived an attempt to oust and even murder him, and the constitution of Florence was modified to favor the Medici. Lorenzo came to be known during his lifetime — with no irony — as "Lorenzo the Magnificent," primarily for his support for learning and the arts. As they had in Cosimo's day, a group of poets, philosophers, and artists spent much of their time at the Medici palace, where Lorenzo patronized writing in Italian as well as humanist scholarship, and himself wrote love lyrics, sonnets, odes, and carnival songs. The group included the humanists Ficino and Giovanni Pico della Mirandola and the artists Michelangelo, Leonardo da Vinci, and Sandro Botticelli, all of them influenced by Platonic concepts of beauty and love. Botticelli's *Adoration of the Magi* shows Cosimo (who was dead by the time the picture was painted) kneeling in front of the Virgin Mary as one of the three kings giving gifts to the infant Jesus, while a black-haired Lorenzo stands with other important Florentines on the right.

In the 1490s many of the Medici bank branches collapsed because of bad loans, and Lorenzo's diplomacy was not successful in maintaining a peaceful balance of power. Like many others in Florence, Lorenzo came under the spell of the charismatic preacher Savonarola, but he died before Savonarola's prediction that God would punish Italy for its vices appeared to come true when the French invaded. The Medici were again ousted, but just as before, they returned, and later became the official and hereditary rulers of Florence and its environs as the Grand Dukes of Tuscany.

QUESTIONS FOR ANALYSIS

1. Renaissance people were fascinated by the quality of virtù, the ability to shape the world around one according to one's will. How did Cosimo and Lorenzo exhibit virtù?
2. The Medici created a model for very wealthy people of how to obtain political and cultural influence. Can you think of more recent examples, including contemporary ones, of those who followed this model?

The Rise of Humanism

The Renaissance was a self-conscious intellectual movement. The realization that something new and unique was happening first came to writers in the fourteenth century, especially to the Italian poet and humanist Francesco Petrarch (frahn-CHEH-skoh PEH-trahrk) (1304–1374). Along with many of his contemporaries, Petrarch sought to reconnect with the classical past, and he believed that such efforts were bringing on a new golden age of intellectual achievement.

Petrarch and other poets, writers, and artists showed a deep interest both in the physical remains of the Roman Empire and in classical Latin texts. The study of Latin classics became known as the *studia humanitates*, usually translated as "liberal studies" or the "liberal arts." People who advocated it were known as *humanists,* and their program as **humanism**. Like all programs of study, humanism contained an implicit philosophy: that human nature and achievements were worthy of contemplation. Humanists did not reject religion; instead they sought to synthesize Christian and classical teachings, pointing out the harmony between them.

humanism A program of study designed by Italians that emphasized the critical study of Latin and Greek literature with the goal of understanding human nature.

Humanists and other Renaissance thinkers emphasized individual achievement. They were especially interested in individuals who had risen above their background to become brilliant, powerful, or unique. Such individuals had the admirable quality of *virtù* (vir-TOO), which is not virtue in the sense of moral goodness, but the ability to shape the world around them according to their will. Humanists thought that their recommended course of study in the classics would provide essential skills for all those who would take on this challenge. Just as Confucian officials did in Song China, they also taught that taking an active role in the world and working for the common good should be the aim of all educated individuals.

Humanists put their educational ideas into practice. They opened schools and academies in which pupils began with Latin grammar and rhetoric, went on to study Roman history and political philosophy, and then learned Greek in order to study Greek literature and philosophy. These classics, humanists taught, would provide models of how to write clearly, argue effectively, and speak persuasively. Gradually humanist education became the basis for intermediate and advanced education for well-to-do urban boys and men. (See “Thinking Like a Historian: Humanist Learning,” page 412.)

Humanists disagreed about education for women. Many saw the value of exposing women to classical models of moral behavior and reasoning, but they also wondered whether a program of study that emphasized eloquence and action was proper for women, whose sphere was generally understood to be private and domestic. Through tutors or programs of self-study a few women did become educated in the classics.

Humanists looked to the classical past for political as well as literary models. The best-known political theorist of this era was Niccolò Machiavelli (nih-KOH-loh mah-kee-ah-VEH-lee) (1469–1527), who worked as an official for the city of Florence until he was ousted in a power struggle. He spent the rest of his life writing, and his most famous work is the political treatise *The Prince* (1513). Using the examples of classical and contemporary rulers, *The Prince* argues that the function of a ruler (or a government) is to preserve order and security. To preserve the state, a ruler should use whatever means necessary — brutality, lying, manipulation — but he should not do anything that would make the populace turn against him. *The Prince* is often seen as the first modern guide to politics in the West, though Machiavelli was denounced for writing it, and people later came to use the word *Machiavellian* to mean cunning and ruthless. Machiavelli put a new spin on the Renaissance search for perfection, arguing that ideals needed to be measured in the cold light of the real world.

THINKING LIKE A HISTORIAN

Humanist Learning

Renaissance humanists wrote often and forcefully about education, and learning was also a subject of artistic works shaped by humanist ideas. What did humanists see as the best course of study and the purpose of education, and how were these different for men and women?

1 **Peter Paul Vergerius, letter to Ubertinus of Padua, 1392.** The Venetian scholar and church official Vergerius (1370–1445) advises the son of the ruler of Padua about the proper education for men.

■ We call those studies liberal which are worthy of a free man; those studies by which we attain and practise virtue and wisdom; that education which calls forth, trains and develops those highest gifts of body and of mind which ennoble men, and which are rightly judged to rank next in dignity to virtue only.… Amongst these I accord the first place to History, on grounds both of its attractiveness and of its utility, qualities which appeal equally to the scholar and to the statesman. Next in importance ranks Moral Philosophy, which indeed is, in a peculiar sense, a “Liberal Art,” in that its purpose is to teach men the secret of true freedom. History, then, gives us the concrete examples of the precepts inculcated by philosophy. The one shews what men should do, the other what men have said and done in the past, and what practical lessons we may draw therefrom for the present day. I would indicate as the third main branch of study, Eloquence, which indeed holds a place of distinction amongst the refined Arts. By philosophy we learn the essential truth of things, which by eloquence we so exhibit in orderly adornment as to bring conviction to differing minds. And history provides the light of experience — a cumulative wisdom fit to supplement the force of reason and the persuasion of eloquence. For we allow that soundness of judgment, wisdom of speech, integrity of conduct are the marks of a truly liberal temper.

2 **Leonardo Bruni, letter to Lady Baptista Malatesta, ca. 1405.** The Florentine humanist and city official Leonardo Bruni advises the daughter of the duke of Urbino about the proper education for women.

■ There are certain subjects in which, whilst a modest proficiency is on all accounts to be desired, a minute knowledge and excessive devotion seem to be a vain display. For instance, subtleties of Arithmetic and Geometry are not worthy to absorb a cultivated mind, and the same must be said of Astrology. You will be surprised to find me suggesting (though with much more hesitation) that the great and complex art of Rhetoric should be placed in the same category. My chief reason is the obvious one, that I have in view the cultivation most fitting to a woman. To her neither the intricacies of debate nor the oratorical artifices of action and delivery are of the least practical use, if indeed they are not positively unbecoming. Rhetoric in all its forms — public discussion, forensic argument, logical fence, and the like — lies absolutely outside the province of woman. What Disciplines then are properly open to her? In the first place she has before her, as a subject peculiarly her own, the whole field of religion and morals. The literature of the Church will thus claim her earnest study…. Moreover, the cultivated Christian lady has no need in the study of this weighty subject to confine herself to ecclesiastical writers. Morals, indeed, have been treated of by the noblest intellects of Greece and Rome. [Then] I place History: a subject which must not on any account be neglected by one who aspires to true cultivation. For it is our duty to understand the origins of our own history and its development; and the achievements of Peoples and of Kings.

3 **Luca della Robbia, *Grammar*, 1437–1439.** In this hexagonal panel made for the bell tower of the cathedral of Florence, Luca della Robbia conveys ideas about the course and goals of learning with the open classical door in the background.

4 **Giovanni Pico della Mirandola, "Oration on the Dignity of Man," 1486.** Pico, the brilliant son of an Italian count and protégé of Lorenzo de' Medici, wrote an impassioned summary of human capacities for learning that ends with this.

■ O sublime generosity of God the Father! O highest and most wonderful felicity of man! To him it was granted to have what he chooses, to be what he wills. At the moment when they are born, beasts bring with them from their mother's womb, as Lucilius [the classical Roman author] says, whatever they shall possess. From the beginning or soon afterwards, the highest spiritual beings have been what they are to be for all eternity. When man came into life, the Father endowed him with all kinds of seeds and the germs of every way of life. Whatever seeds each man cultivates will grow and bear fruit in him. If these seeds are vegetative, he will be like a plant; if they are sensitive, he will become like the beasts; if they are rational, he will become like a heavenly creature; if intellectual, he will be an angel and a son of God. And if, content with the lot of no created being, he withdraws into the centre of his own oneness, his spirit, made one with God in the solitary darkness of the Father, which is above all things, will surpass all things. Who then will not wonder at this chameleon of ours, or who could wonder more greatly at anything else?

5 **Cassandra Fedele, "Oration on Learning," 1487.** The Venetian Cassandra Fedele (1465–1558), the best-known female scholar of her time, gave an oration in Latin at the University of Padua in honor of her (male) cousin's graduation.

■ I shall speak very briefly on the study of the liberal arts, which for humans is useful and honorable, pleasurable and enlightening since everyone, not only philosophers but also the most ignorant man, knows and admits that it is by reason that man is separated from beasts. For what is it that so greatly helps both the learned and the ignorant? What so enlarges and enlightens men's minds the way that an education in and knowledge of literature and the liberal arts do? … But erudite men who are filled with the knowledge of divine and human things turn all their thoughts and considerations toward reason as though toward a target, and free their minds from all pain, though plagued by many anxieties. These men are scarcely subjected to fortune's innumerable arrows and they prepare themselves to live well and in happiness. They follow reason as their leader in all things; nor do they consider themselves only, but they are also accustomed to assisting others with their energy and advice in matters public and private.… The study of literature refines men's minds, forms and makes bright the power of reason, and washes away all stains from the mind, or at any rate, greatly cleanses it.… States, however, and their princes who foster and cultivate these studies become more humane, more gracious, and more noble.… But enough on the utility of literature since it produces not only an outcome that is rich, precious, and sublime, but also provides one with advantages that are extremely pleasurable, fruitful, and lasting — benefits that I myself have enjoyed. And when I meditate on the idea of marching forth in life with the lowly and execrable weapons of the little woman — the needle and the distaff [the rod onto which yarn is wound after spinning] — even if the study of literature offers women no rewards or honors, I believe women must nonetheless pursue and embrace such studies alone for the pleasure and enjoyment they contain.

ANALYZING THE EVIDENCE

1. According to these sources, what should people learn? Why should they learn?

2. Renaissance humanism has sometimes been viewed as opposed to religion, especially to the teachings of the Catholic Church at the time. Do these sources support this idea?
3. How are the programs of study recommended for men and women similar? How and why are they different?
4. How does the gender of the author shape his or her ideas about the human capacity for reason and learning?

PUTTING IT ALL TOGETHER

Using the sources above, along with what you have learned in class and in this chapter, write a short essay that analyzes humanist learning. What were the goals and purposes of humanist education, and how were these different for men and women? How did these differences reflect Renaissance society more generally?

Christian Humanism

In the last quarter of the fifteenth century students from the Low Countries, France, Germany, and England flocked to Italy, absorbed the “new learning” of humanism, and carried it back to their own countries. Northern humanists shared the Italians’ ideas about the wisdom of ancient texts and felt even more strongly that the best elements of classical and Christian cultures should be combined. These **Christian humanists**, as they were later called, saw humanist learning as a way to bring about reform of the church and to deepen people’s spiritual lives.

Christian humanists Humanists from northern Europe who thought that the best elements of classical and Christian cultures should be combined and saw humanist learning as a way to bring about reform of the church and deepen people’s spiritual lives.

The Englishman Thomas More (1478–1535) began life as a lawyer, studied the classics, and entered government service. He became best known for his controversial dialogue *Utopia* (1516). *Utopia* describes a community on an island somewhere beyond Europe where all children receive a good humanist education and adults divide their days between manual labor or business pursuits and intellectual activities. The problems that plagued More’s fellow citizens, such as poverty and hunger, are solved by a beneficent government. Inequality and greed are prevented because profits from business and property are held in common, not privately. Furthermore, there is religious tolerance, and order and reason prevail.

Better known by contemporaries than Thomas More was the Dutch humanist Desiderius Erasmus (deh-she-DEHR-ee-uhs eh-RAHS-muhs) (1466?–1536) of Rotterdam. His fame rested largely on his exceptional knowledge of Greek and the Bible, as well as his many publications. For Erasmus, education was the key to moral and intellectual improvement, and true Christianity was an inner attitude of the spirit, not a set of outward actions.

Printing and Its Social Impact

The impact of new ideas during this period was magnified by the invention of the printing press with movable metal type. While printing with movable type was invented in China (see “The Scholar-Officials and Neo-

Confucianism" in Chapter 13), movable *metal* type was actually developed in the thirteenth century in Korea, though it was tightly controlled by the monarchy and did not have the broad impact there that printing did in Europe. Printing with movable metal type developed in Germany around 1450. Several metal-smiths, most prominently Johann Gutenberg (ca. 1400–1468), transformed the metal stamps used to mark signs on jewelry into type that could be covered with ink and used to mark symbols onto a page. This type could be rearranged for every page and thus could be used over and over. The printing revolution was also enabled by the ready availability of paper, which was made using techniques that had originated in China and spread from Muslim Spain to the rest of Europe.

The effects of the invention of movable-type printing were not felt overnight. Nevertheless, within a half century of the publication of Gutenberg's Bible of 1456, movable type had brought about radical changes. Historians estimate that somewhere between 8 million and 20 million books were printed in Europe between 1456 and 1500, many more than the total number of books that had been produced in the West during the many millennia between the invention of writing and 1456.

Printing transformed both the private and the public lives of Europeans. In the public realm, government and church leaders both used and worried about printing. They printed laws, declarations of war, battle accounts, and propaganda, but they also attempted to censor or ban books and authors whose ideas they thought were wrong. These efforts were rarely effective.

In the private realm, printing enabled people to read identical books so that they could more easily discuss the ideas that the books contained. Although most of the earliest books and pamphlets dealt with religious subjects, printers produced anything that would sell. Illustrations increased a book's sales, so printers published books full of woodcuts and engravings. Additionally, single-page broadsides and fly sheets allowed public events and "wonders" such as comets and two-headed calves to be experienced vicariously. Since books and other printed materials were read aloud to illiterate listeners, print bridged the gap between the written and oral cultures.

Because many laypeople could not read Latin, printers put out works in vernacular languages, fostering standardization in these languages. Works in these languages were also performed on stage. Traveling companies of actors performed before royal courts and in town squares, and in larger cities public theaters offered bawdy comedies and bloody tragedies. In London the works of William Shakespeare (1564–1616) were especially popular.

Art and the Artist

No feature of the Renaissance evokes greater admiration than its artistic masterpieces. In Renaissance Italy wealthy merchants, bankers, popes, and princes spent vast sums to commission art as a means of glorifying themselves and their families. Patrons varied in their level of involvement as a work progressed; some simply ordered a specific subject or scene, while others oversaw the work of the artist or architect very closely.

Michelangelo's *David* (1501–1504) and the *Last Judgment* (detail, 1537–1541) Like all Renaissance artists, Michelangelo worked largely on commissions from patrons. Officials of the city of Florence contracted the young sculptor to produce a statue of the Old Testament hero David to be displayed in the city's main square. Michelangelo portrayed David anticipating his fight against the giant Goliath, and the statue came to symbolize the republic of Florence standing up to its larger and more powerful enemies. More than thirty years later, Michelangelo was commissioned by the pope to paint a scene of the Last Judgment on the altar wall of the Sistine Chapel, where he had earlier spent four years covering the ceiling with magnificent frescoes. The massive work shows a powerful Christ standing in judgment, with souls ascending into Heaven while others are dragged by demons into Hell (above). The *David* captures ideals of human perfection and has come to be an iconic symbol of Renaissance artistic brilliance, while the dramatic and violent *Last Judgment* conveys both terror and divine power.

As a result of patronage, certain artists gained great public acclaim and adulation, leading many historians to view the Renaissance as the beginning of the concept of the artist as genius. In the Middle Ages, people believed that only God created, albeit through individuals, and artistic originality was not particularly valued. By contrast, Renaissance artists and humanists came to think that a work of art was the deliberate creation of a unique personality, of an individual who transcended traditions, rules, and theories.

In terms of artistic themes, religious topics remained popular among both patrons and artists, but frequently the patron had himself and his family portrayed in the scene. As the fifteenth century advanced and humanist ideas spread more widely, classical themes and motifs figured increasingly in painting and sculpture. Classical styles also influenced architecture, as architects designed buildings that featured arches and domes modeled on the structures of ancient Rome.

Plate Showing the Abduction of Helen of Troy
Filled with well-muscled men, curvaceous women, and exotic landscapes, this colorful plate depicts a well-known scene from Greek mythology, the abduction of Helen, which sparked the Trojan War. Such tin-glazed pottery, known as maiolica and made in many places in Italy beginning in the late fifteenth century, was sold throughout Europe to wealthy consumers, who favored designs with family crests or legendary or historical scenes, known as *istoriato* ("painted with stories").

The individual portrait emerged as a distinct genre in Renaissance art. Rather than reflecting a spiritual ideal, as medieval painting and sculpture tended to do, Renaissance portraits showed human ideals, often portrayed in a more realistic style. The Florentine sculptor Donatello (doh-nah-TELL-oh) (1386–1466) revived the classical figure. Leonardo da Vinci (1452–1519) was particularly adept at portraying female grace and beauty. Another Florentine artist, Raphael Sanzio (RAH-feh-ell SAN-zee-oh) (1483–1520), painted hundreds of portraits, becoming the most sought-after artist in Europe (see the portrait at the beginning of this chapter).

In the late fifteenth century the center of Renaissance art shifted from Florence to Rome, where wealthy cardinals and popes became active patrons of the arts. To meet this demand, Michelangelo Buonarroti (mee-kell-AN-geh-loh bwa-nah-RAH-tee) (1475–1564) went to Rome from Florence in about 1500 and began the series of statues, paintings, and architectural projects from which he gained an international reputation. Most famously, between 1508 and 1512 he painted religiously themed frescoes on the ceiling and altar wall of the Sistine Chapel.

***The Chess Game*, 1555** In this oil painting, the Italian artist Sofonisba Anguissola (1532–1625) shows her three younger sisters playing chess, a game that was growing in popularity in the sixteenth century. Each sister looks at the one immediately older than herself, with the girl on the left looking out at her sister, the artist. Anguissola's father, a minor nobleman, recognized his daughter's talent and arranged for her to study with several painters. She became a court painter at the Spanish royal court, where she painted many portraits. Returning to Italy, she continued to be active, painting her last portrait when she was over eighty.

In both Italy and northern Europe most aspiring artists were educated in the workshops of older artists. By the later sixteenth century formal academies were also established to train artists. Like universities, artistic workshops and academies were male-only settings. Several women did become well known as painters during the Renaissance, but they were trained by their artist fathers and often quit painting when they married.

Women were not alone in being excluded from the institutions of Renaissance culture. Though a few talented artists such as Leonardo and

Michelangelo emerged from artisanal backgrounds, most scholars and artists came from families with at least some money. The audience for artists’ work was also exclusive, limited mostly to educated and prosperous citizens. Although common people in large cities might have occasionally seen plays such as those of Shakespeare, most people lived in villages with no access to formal schooling or to the work of prominent artists. In general a small, highly educated minority of literary humanists and artists created the culture of and for a social elite. In this way the Renaissance maintained, and even enhanced, a gulf between the learned minority and the uneducated multitude.

Social Hierarchies

What were the key social hierarchies in Renaissance Europe, and how did these hierarchies shape people's lives?

The division between the educated and uneducated was one of many social hierarchies evident in the Renaissance. Other hierarchies built on those of the Middle Ages, but also developed new features that contributed to modern social hierarchies, such as those of race, class, and gender.

Race and Slavery

Renaissance people did not use the word *race* the way we do, but often used *race*, *people*, and *nation* interchangeably for ethnic, national, and religious groups. They did make distinctions based on skin color that were in keeping with later conceptualizations of race, but these distinctions were interwoven with other characteristics when people thought about human differences.

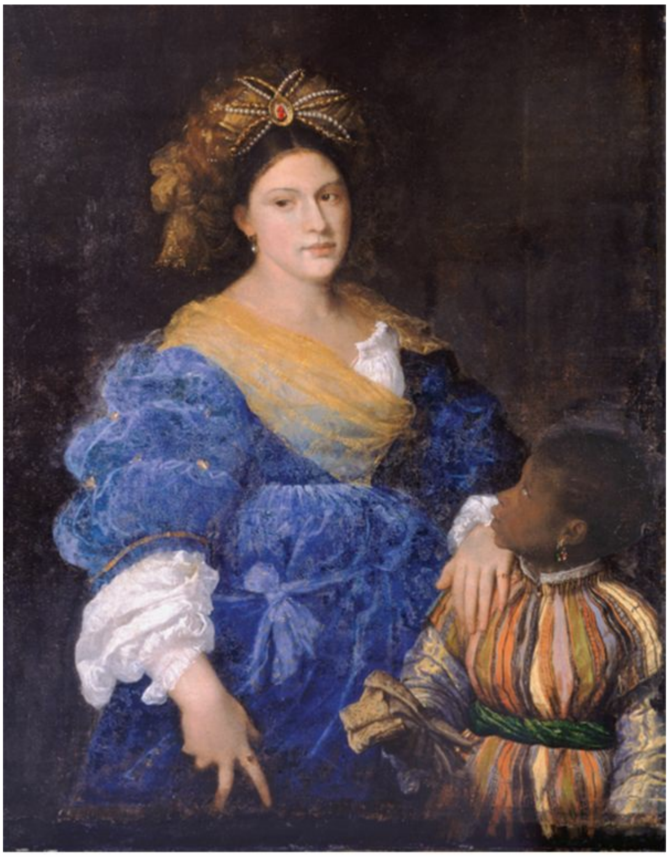
Ever since the time of the Roman Republic, a few black Africans had lived in western Europe. They had come, along with white slaves, as the spoils of war. After the collapse of the Roman Empire and throughout the Middle Ages, Muslim and Christian merchants continued to import black slaves. The black population was especially concentrated in the cities of the Iberian Peninsula. By the mid-sixteenth century blacks, slave and free, constituted roughly 3 percent of the Portuguese population. Slaves and a few free black people could be found in courts and cities in other parts of Europe as well, especially in Italy. (See "Analyzing the Evidence: Titian, *Laura de Dianti*," above.)

In Renaissance Portugal, Spain, and Italy, African slaves supplemented the labor force in virtually all occupations. Slaves also formed the primary workforce on the sugar plantations set up by Europeans on the Atlantic islands in the late fifteenth century (see "Sugar and Early Transatlantic Slavery" in Chapter 16).

Until their voyages down the African coast in the late fifteenth century, Europeans had little concrete knowledge of Africans and their cultures. They perceived Africa as a remote place, the home of strange people isolated by heresy and Islam from superior European civilization. Africans' contact, even as slaves, with Christian Europeans would only "improve" the blacks, they believed. The expanding slave trade reinforced negative preconceptions about the inferiority of black Africans.

ANALYZING THE EVIDENCE

Titian, *Laura de Dianti*



Photograph © Human Bios GmbH, Switzerland/Provenance: Private Collection

The Venetian artist Titian (1488?–1576) was a master of many types of paintings during his long life, including giant frescoes and oil paintings of religious and historical subjects, classical scenes set in verdant landscapes, and portraits of prominent and wealthy individuals. In the 1520s he was hired by Alfonso d'Este, the duke of Ferrara, to paint large mythological scenes for his private study in the ducal palace, and in 1523 he also painted this portrait of Este's lover, Laura de Dianti, who may have also been Este's third wife. Titian shows her in a gorgeous blue dress and an elaborate pearl and feather headdress, accompanied by a young black page with a gold earring. Wealthy Europeans sometimes had themselves painted with their black servants to indicate their wealth. The boy was most likely a slave, though sometimes free black families lived at courts, in order to produce the young black children who were highly prized as servants. Slaves from Africa and the Ottoman Empire were common in wealthy Italian urban households. Venice served as a major slave-trading hub, with Venetian merchants selling Slavic and Baltic slaves to be transported to Muslim areas, and African and Turkish slaves to be transported to Christian areas. Household slaves in Italian cities, most of whom were girls and women, worked at various tasks, but they were also symbols of the exotic, just as they were at court.

QUESTIONS FOR ANALYSIS

1. How does Titian convey the message that this woman is wealthy and connected to Venice’s overseas trade?
2. How does Titian use the boy’s skin color to highlight the woman’s fair skin, which was one of the Renaissance ideals of female beauty?
3. What does this painting suggest about Renaissance European attitudes about gender, race, and class?

Wealth and the Nobility

By the thirteenth century, and even more so by the fifteenth, the idea of a hierarchy based on wealth was emerging. This was particularly true in cities, where wealthy merchants oversaw vast trading empires, held positions of political power, and lived in splendor rivaling that enjoyed by the richest nobles. (See “Individuals in Society: Cosimo and Lorenzo de’ Medici,” page 409.)

The development of a hierarchy of wealth did not mean an end to the prominence of nobles, however, and even poorer nobles still had higher status than wealthy commoners did. Thus wealthy Italian merchants enthusiastically bought noble titles in the fifteenth century, and wealthy English and Spanish merchants married their daughters and sons into often-impoverished noble families. The nobility maintained its status in most parts of Europe not by maintaining rigid boundaries, but by taking in and integrating the new social elite created by the hierarchy of wealth.

Gender Roles

Renaissance people would not have understood the word *gender* to refer to categories of people, but they would have easily grasped the concept. Toward the end of the fourteenth century learned men (and a few women) began what was termed the **debate about women**, an argument about women’s character, nature, and proper role in society that would last for centuries. Misogynist critiques of women from both clerical and secular authors denounced females as devious, domineering, and demanding. In response, several authors compiled long lists of famous and praiseworthy women. Some writers, including a few women who had gained a humanist education, were interested not only in defending women but also in exploring the reasons behind women’s secondary status.

Italian City Scene In this detail from a fresco, the Italian painter Lorenzo Lotto captures the mixing of social groups in a Renaissance Italian city. The crowd of men in the left foreground includes wealthy merchants in elaborate hats and colorful coats. Two mercenary soldiers (carrying a sword and a pike) wear short doublets and tight hose stylishly slit to reveal colored undergarments, while boys play with toy weapons at their feet. Clothing like that of the soldiers, which emphasized the masculine form, was frequently criticized for its expense and its "indecency." At the right, women sell vegetables and bread, which would have been a common sight at any city marketplace.

Beginning in the sixteenth century the debate about women also became a debate about female rulers, because in Spain, England, France, and Scotland women served as advisers to child-kings or ruled in their own right. There were no successful rebellions against female rulers simply because they were women; in part this was because female rulers, especially Queen Elizabeth I of England, emphasized qualities regarded as masculine — physical bravery, stamina, wisdom, duty — whenever they appeared in public.

The dominant notion of the “true” man was that of the married head of household, so men whose class and age would have normally conferred political power but who remained unmarried were sometimes excluded from ruling positions. Actual marriage patterns in Europe left many women unmarried until late in life, but this did not lead to greater equality. Women who worked for wages, as was typical, earned about half to two-thirds of what men did even for the same work. Of all the ways in which Renaissance society was hierarchically arranged — by class, age, level of education, rank, race, occupation — gender was regarded as the most “natural” distinction and therefore the most important one to defend.

Politics and the State in the Renaissance

How did the nation-states of western Europe evolve in this period?

Beginning in the fifteenth century monarchs used aggressive methods to build up their governments. As they built and maintained power, they emphasized royal majesty and royal sovereignty and insisted on the respect and loyalty of all subjects.

France

The Black Death and the Hundred Years' War left France drastically depopulated, commercially ruined, and agriculturally weak (see "The Hundred Years' War" in Chapter 14). Nonetheless, Charles VII (r. 1422–1461) revived the monarchy and France. He reorganized the royal council, giving increased influence to middle-class men, and strengthened royal finances through taxes on certain products and on land. Moreover, Charles created the first permanent royal army anywhere in Europe.

Two further developments strengthened the French monarchy. The marriage of Louis XII (r. 1498–1515) and Anne of Brittany added Brittany to the state. Louis XII's successor, Francis I (r. 1515–1547), and Pope Leo X reached a mutually satisfactory agreement about church and state powers in 1516 that gave French kings the power to control the appointment and thus the policies of church officials in the kingdom.

England

English society suffered severely in the fourteenth and fifteenth centuries. Between 1455 and 1471 adherents of the ducal houses of York and Lancaster waged civil wars over control of the English throne, commonly called the Wars of the Roses. The chronic disorder hurt trade, agriculture, and domestic industry, and the authority of the monarchy sank lower than it had been in centuries.

The Yorkist Edward IV (r. 1461–1483) succeeded in defeating the Lancastrian forces and after 1471 began to reconstruct the monarchy and consolidate royal power. Henry VII (r. 1485–1509) of the Welsh house of Tudor worked to restore royal prestige, to crush the power of the nobility, and to establish order and law at the local level. Because the government halted the long period of anarchy, it won the key support of the merchant and agricultural upper middle class. Under Henry VII the center of royal authority was the royal council. There Henry VII revealed his distrust of the nobility: very few great lords were among the king's closest advisers, who instead were lesser landowners and lawyers. The royal council handled any business the king put before it — executive, legislative, and judicial.

Secretive, cautious, and thrifty, Henry VII rebuilt the monarchy. He encouraged the cloth industry and built up the English merchant marine. He crushed an invasion from Ireland, secured peace with Scotland, and enhanced English prestige through the marriage of his eldest son, Arthur, to Catherine of Aragon, the daughter of Ferdinand and Isabella of Spain. (Several years after Arthur's death, Catherine would become the wife of his younger brother and the next king of England, Henry VIII; see "England's Shift Toward Protestantism.") When Henry VII died in 1509, he left a country at peace both domestically and internationally, a substantially augmented treasury, and the dignity and role of the Crown much enhanced.

Spain

While England and France laid the foundations of unified nation-states during the Renaissance, Spain remained a conglomerate of independent kingdoms. Even the wedding in 1469 of Isabella of Castile and Ferdinand of Aragon did not bring about administrative unity. Isabella and Ferdinand were, however, able to exert their authority in ways similar to those of the rulers of France and England. They curbed aristocratic power by excluding aristocrats and great territorial magnates from the royal council. They also secured from the Spanish pope Alexander VI the right to appoint bishops in Spain and in the Hispanic territories in America, enabling them to establish the equivalent of a national church. In 1492 their armies conquered Granada, the last territory held by Arabs in southern Spain.

Ferdinand and Isabella's rule also marked the start of greater persecution of the Jews. In the Middle Ages, the kings of France and England had expelled the Jews from their kingdoms, and many had sought refuge in Spain. During the long centuries of the reconquista (see "The Expansion of Western and Eastern Christianity" in Chapter 14), Christian kings in Spain had renewed Jewish rights and privileges; in fact, Jewish industry, intelligence, and money had supported royal power.

In the fourteenth century anti-Semitism in Spain was aggravated by fiery anti-Jewish preaching, by economic dislocation, and by the search for a scapegoat during the Black Death. Anti-Semitic pogroms (violent massacres and riots directed against Jews) swept the towns of Spain, and perhaps 40 percent of the Jewish population was killed or forced to convert. Those who converted were called *conversos* (kuhn-VEHR-sohz) or New Christians. Conversos were often well educated and held prominent positions in government and business.

Such successes bred resentment. Aristocrats resented their financial dependence on conversos, the poor hated the converso tax collectors, and churchmen doubted the sincerity of their conversions. Queen Isabella shared these suspicions, and she and Ferdinand received permission from Pope Sixtus IV to establish an Inquisition to look for conversos who showed any sign of incomplete conversion.

Most conversos identified themselves as sincere Christians; many came from families that had received baptism generations before. In response, officials of the Inquisition developed a new type of anti-Semitism. A person's status as a Jew, they argued, could not be changed by religious conversion, but was in the person's blood and was heritable, so Jews could never be true Christians. Under what were known as "purity of blood" laws, having "pure Christian blood" became a requirement for noble status. Ideas about Jews developed in Spain became important components in European concepts of race, and discussions of "Jewish blood" later expanded into discriminatory definitions of the "Jewish race."

In 1492, shortly after the conquest of Granada, Isabella and Ferdinand issued an edict expelling all practicing Jews from Spain. Of the community of perhaps 200,000 Jews, 150,000 fled. Absolute religious orthodoxy and "purity of blood" served as the theoretical foundation of the Spanish national state.

The Habsburgs

War and diplomacy were important ways that states increased their power in sixteenth-century Europe, but so was marriage. Because almost all of Europe was ruled by hereditary dynasties, claiming and holding resources involved shrewd marital strategies, for it was far cheaper to gain land by inheritance than by war. The benefits of an advantageous marriage stretched across generations, as can be seen most dramatically with the Habsburgs. The Holy Roman emperor Frederick III, a Habsburg who was the ruler of most of Austria, acquired only a small amount of territory — but a great deal of money — with his marriage to Princess Eleanore of Portugal in 1452. He arranged for his son Maximilian to marry Europe's most prominent heiress, Mary of Burgundy. Through this union with the rich and powerful duchy of Burgundy, the Austrian house of Habsburg, already the strongest ruling family in the empire, became an international power. The marriage of Maximilian and Mary angered the French, and it inaugurated centuries of conflict between the Habsburgs and the kings of France. Within the empire, German principalities that resented Austria's pre-eminence began to see that they shared interests with France.

Maximilian learned the lesson of marital politics well, marrying his son and daughter to the children of Ferdinand and Isabella, the rulers of Spain, much of southern Italy, and eventually the Spanish New World empire. His grandson Charles V (1500–1558) fell heir to a vast and incredibly diverse collection of states and peoples (Map 15.1). Charles was convinced that it was his duty to maintain the political and religious unity of Western Christendom. This conviction would be challenged far more than Charles ever anticipated.

The Protestant Reformation

What were the central ideas of Protestant reformers, and why were they appealing to various groups across Europe?

Calls for reform in the church came from many quarters in early-sixteenth-century Europe — from educated laypeople and urban residents, from villagers and artisans, and from church officials themselves. This dissatisfaction helps explain why the ideas of Martin Luther, an obscure professor from a new and not very prestigious German university, found a ready audience. Within a decade of his first publishing his ideas (using the new technology of the printing press), much of central Europe and Scandinavia had broken with the Catholic Church in a movement that came to be known as the **Protestant Reformation**. In addition, even more radical concepts of the Christian message were being developed and linked to calls for social change.

Criticism of the Church

Sixteenth-century Europeans were deeply pious, but many people were also highly critical of the Roman Catholic Church and its clergy. Papal conflicts with rulers and the Great Schism (see “Challenges to the Christian Church” in Chapter 14) badly damaged the prestige of church leaders. Papal tax collection methods were also attacked, and some criticized the papacy itself as an institution.

In the early sixteenth century critics of the church concentrated their attacks on clerical immorality, ignorance, and absenteeism. Charges of immorality were aimed at a number of priests who were drunkards, neglected the rule of celibacy, gambled, or indulged in fancy dress. Charges of ignorance applied to barely literate priests who delivered poor-quality sermons.

In regard to absenteeism, many clerics, especially higher ecclesiastics, held several benefices (offices) simultaneously. However, they seldom visited the communities served by the benefices. Instead they collected revenues from all the benefices assigned to them and hired a poor priest to fulfill their spiritual duties, paying him just a fraction of the income.

There was also local resentment of clerical privileges and immunities.

Priests, monks, and nuns were exempt from civic responsibilities, such as defending the city and paying taxes. Yet religious orders frequently held large amounts of urban property. City governments were increasingly determined to integrate the clergy into civic life. This brought city leaders into opposition with bishops and the papacy, which for centuries had stressed the independence of the church from lay control.

Martin Luther

By itself, widespread criticism of the church did not lead to the dramatic changes of the sixteenth century. Those resulted from the personal religious struggle of a German Augustinian friar and professor at the University of Wittenberg, Martin Luther (1483–1546).

Martin Luther was a very conscientious friar, but his scrupulous observance of the religious routine, frequent confessions, and fasting gave him only temporary relief from anxieties about sin and his ability to meet God’s demands. Through his study of Saint Paul’s letters in the New Testament, he gradually arrived at a new understanding of Christian doctrine. His understanding is often summarized as “faith alone, grace alone, scripture alone.” He believed that salvation and justification (righteousness in God’s eyes) come through faith, and that faith is a free gift of God, not the result of human effort. God’s word is revealed only in biblical scripture, not in the traditions of the church.

At the same time that Luther was engaged in scholarly reflections and professorial lecturing, Pope Leo X authorized a special Saint Peter’s indulgence to finance his building plans in Rome. An **indulgence** was a document issued by the pope that substituted for earthly penance or time in purgatory. The archbishop who controlled the area in which Wittenberg was located, Albert of Mainz, also promoted the sale of indulgences, in his case to pay off a debt he had incurred to be named bishop of several additional territories. Albert’s sales campaign promised that the purchase of indulgences would bring full forgiveness for one’s own sins or buy release from purgatory for a loved one. One of the slogans — “As soon as coin in coffer rings, the soul from purgatory springs” — brought phenomenal success.

Selling Indulgences A German single-page pamphlet shows a monk offering an indulgence, with the official seals of the pope attached, as people run to put their money in the box in exchange for his promise of heavenly bliss, symbolized by the dove above his head. Indulgences were sold widely in Germany, and they were the first Catholic practice that Luther criticized openly. This pamphlet also attacks the sale of indulgences, calling it devilish and deceitful, a point of view expressed in the woodcut by the peddler's riding on a donkey, an animal that had long been used as a symbol of ignorance. Indulgences were often printed as fill-in-the-blank forms. This one, purchased in 1521, has space for the indulgence seller's name at the top, the buyer's name in the middle, and the date at the bottom. (woodcut: akg-images; indulgence: Visual Connection Archive)

Luther was severely troubled that many people believed that they had no further need for repentance once they had purchased indulgences. In October 1517 he wrote a letter to Archbishop Albert on the subject and enclosed in Latin his "Ninety-five Theses on the Power of Indulgences." His argument was that indulgences undermined the seriousness of the sacrament of penance and competed with the preaching of the Gospel. Luther intended his theses for academic debate, but by December of that year they had been translated into German and were being read throughout central Europe. Luther was ordered to go to Rome, but he was able to avoid this because the ruler of the territory in which he lived protected him. The pope nonetheless ordered him to recant many of his ideas, and

Luther publicly burned the letter containing the papal order. In this highly charged atmosphere, the twenty-one-year-old emperor Charles V summoned Luther to appear before the **Diet of Worms**, an assembly of representatives from the territories of the Holy Roman Empire meeting in the city of Worms in 1521. Luther, however, refused to give in to demands that he take back his ideas.

Protestant Thought and Its Appeal

As he developed his ideas, Luther gathered followers, who came to be called Protestants. At first **Protestant** meant “a follower of Luther,” but with the appearance of many other reformers, it became a general term applied to all non-Catholic western European Christians.

Protestant Originally meaning “a follower of Luther,” this term came to be generally applied to all non-Catholic western European Christians.

Catholics and Protestants disagreed on many issues. Catholic teaching held that salvation is achieved by both faith and good works, while Protestants held that salvation comes by faith alone, irrespective of good works or the sacraments. God, not people, initiates salvation. (See “Analyzing the Evidence: Martin Luther, *On Christian Liberty*,” above.) Christian doctrine had long maintained that authority rests both in the Bible and in the traditional teaching of the church, but Protestants asserted that authority rested in the Bible alone. For a doctrine or issue to be valid, they thought, it had to have a scriptural basis. Roman Catholics saw the church as a clerical, hierarchical institution headed by the pope in Rome, while Protestants rejected the authority of the pope and developed various forms of church governance and organization. They also rejected the Catholic idea that monastic religious life was superior, so they closed monasteries and convents and championed marriage as the best Christian life.

Pulpits and printing presses spread the Protestant message all over Germany, and by the middle of the sixteenth century people of all social classes had rejected Catholic teachings and become Protestant. What was the immense appeal of Luther’s religious ideas and those of other Protestants?

Educated people and humanists were attracted by Luther’s ideas. He advocated a simpler personal religion based on faith, a return to the spirit of the early church, the centrality of the Scriptures in the liturgy and in Christian life, and the abolition of elaborate ceremonies — precisely the reforms the Christian humanists had been calling for. His insistence that everyone should read and reflect on the Scriptures attracted the literate middle classes. Luther’s ideas also appealed to townspeople who envied the church’s wealth and resented paying for it. After cities became Protestant, the city council taxed the clergy and placed them under the jurisdiction of civil courts.

The printing press also contributed to Luther’s fame and success. Many printed works included woodcuts and other illustrations, so that even those who could not read could grasp the main ideas. Hymns were also important means of conveying central points of doctrine, as was Luther’s translation of the New Testament into German in 1523.

Luther worked closely with political authorities, viewing them as fully justified in reforming the church in their territories. He instructed all Christians to obey their secular rulers, whom he saw as divinely ordained to maintain order. Individuals may have been convinced of the truth of Protestant teachings on their own, but a territory became Protestant when its ruler brought in reformers to re-educate the territory’s clergy, sponsored public sermons, and confiscated church property. This happened in many of the states of the empire during the 1520s and then moved beyond the empire to Denmark-Norway and Sweden.

ANALYZING THE EVIDENCE

Martin Luther, *On Christian Liberty*

The idea of liberty or freedom has played a powerful role in the history of human society, but the meaning and understanding of liberty have changed. In the Roman world liberty meant the condition of being a free man rather than a slave, and in the Middle Ages possessing liberty meant having special privileges or rights that other persons did not have. Citizens in London, for example, were said to possess the “freedom of the city,” which allowed them to practice trades and own property without interference. Liberty also has a religious dimension, and the reformer Martin Luther formulated a classic interpretation of liberty in his treatise *On Christian Liberty* (sometimes translated as *On the Freedom of a Christian*), arguably his finest piece. Written in Latin for the pope but translated immediately into German and published widely, it contains the main themes of Luther’s theology: the importance of faith, the relationship of Christian faith and good works, the dual nature of human beings, and the fundamental importance of scripture. Luther writes that Christians were freed from sin and death through Christ, not by their own actions.

A Christian man is the most free lord of all, and subject to none; a Christian man is the dutiful servant of all, and subject to everyone. Although these statements appear contradictory, yet, when they are found to agree together, they will do excellently for my purpose. They are both the statements of Paul himself, who says, “Though I be free from all men, yet have I made myself a servant unto all” (I Corinthians 9:19), and “Owe no man anything but to love one another” (Romans 13:8). Now love is by its own nature dutiful and obedient to the beloved object. Thus even Christ, though Lord of all things, was yet made of a woman; made under the law; at once free and a servant; at once in the form of God and in the form of a servant.

Let us examine the subject on a deeper and less simple principle. Man is composed of a twofold nature, a spiritual and a bodily. As regards the spiritual nature, which they name the soul, he is called the spiritual, inward, new man; as regards the bodily nature, which they name the flesh, he is called the fleshly, outward, old man. The Apostle speaks of this: “Though our outward man perish, yet the inward man is renewed day by day” (II Corinthians 4:16)….

We first approach the subject of the inward man, that we may see by what means a man becomes justified, free, and a true Christian; that is, a spiritual, new, and inward man. It is certain that absolutely none among outward things, under whatever name they may be reckoned, has any influence in producing Christian righteousness or liberty, nor, on the other hand, unrighteousness or slavery. This can be shown by an easy argument. What can it profit to the soul that the body should be in good condition, free, and full of life, that it should eat, drink, and act according to its pleasure, when even the most impious slaves of every kind of vice are prosperous in these matters? Again, what harm can ill health, bondage, hunger, thirst, or any other outward evil, do to the soul, when even the most pious of men, and the freest in the purity of their conscience, are harassed by these things? Neither of these states of things has to do with the liberty or the slavery of the soul.

And so it will profit nothing that the body should be adorned with sacred vestment, or dwell in holy places, or be occupied in sacred offices, or pray, fast, and abstain from certain meats, or do whatever works can be done through the body and in the body. Something widely different will be necessary for the justification and liberty of the soul, since the things I have spoken of can be done by an impious person, and only hypocrites are produced by devotion to these things. On the other hand, it will not at all injure the soul that the body should be clothed in profane raiment, should dwell in profane places, should eat and drink in the ordinary fashion, should not pray aloud, and should leave undone all the things above mentioned, which may be done by hypocrites….

One thing, and one alone, is necessary for life, justification, and Christian liberty; and that is the most Holy Word of God, the Gospel of Christ, as He says, “I am the resurrection and the life; he that believeth in me shall not die eternally” (John 9:25), and also, “If the Son shall make you free, ye shall be free indeed” (John 8:36)…. Let us therefore hold it for certain and firmly established that the soul can do without everything except the Word of God, without which none at all of its wants is provided for….

But you will ask, “What is this Word, and by what means is it to be used, since there are so many words of God?” I answer, “The Apostle Paul (Romans 1) explains what it is, namely the Gospel of God, concerning His Son, incarnate, suffering, risen, and glorified through the Spirit, the Sanctifier.” To preach Christ is to feed the soul, to justify it, to set it free, and to save it, if it believes the preaching. For faith alone, and the efficacious use of the Word of God, bring salvation. “If thou shalt confess with thy mouth the Lord Jesus, and shalt believe in thine heart that God hath raised Him from the dead, thou shalt be saved” (Romans 9:9); … and “The just shall live by faith” (Romans 1:17)….

When you begin to believe, you learn at the same time that all that is in you is utterly guilty, sinful, and damnable, according to that saying, “All have sinned, and come short of the glory of God” (Romans 3:23)…. When you have learned this, you will know that Christ is necessary for you, since He has suffered and risen again for you, that, believing on Him, you might by this faith become another man, all your sins being remitted, and you being justified by the merits of another, namely Christ alone….

And since it [faith] alone justifies, it is evident that by no outward work or labour can the inward man be at all justified, made free, and saved; and that no works whatever have any relation to him…. Therefore the first care of every Christian ought to be to lay aside all reliance on works, and strengthen his faith alone more and more, and by it grow in knowledge, not of works, but of Christ Jesus, who has suffered and risen again for him, as Peter teaches (I Peter 5).

QUESTIONS FOR ANALYSIS

1. What did Luther mean by liberty?
2. Why, for Luther, was scripture basic to Christian life?

The Radical Reformation and the German Peasants’ War

In the sixteenth century the practice of religion remained a public matter. The ruler determined the official form of religious practice in his (or occasionally her) jurisdiction. Almost everyone believed that the presence of a faith different from that of the majority represented a political threat to the security of the state.

Some individuals and groups rejected the idea that church and state needed to be united, however, and they sought to create a voluntary community of believers as they understood it to have existed in New Testament times. In terms of theology and spiritual practices, these individuals and groups varied widely, though they are generally termed “radicals” for their insistence on a more extensive break with prevailing ideas. Some adopted the custom of baptizing adult believers — for which they were given the title of “Anabaptists” by their enemies — while others saw all outward sacraments or rituals as misguided. Some groups attempted communal ownership of property. Some reacted harshly to members who deviated from the group’s accepted practices, but others argued for complete religious tolerance and individualism.

Religious radicals were met with fanatical hatred and bitter persecution, including banishment and execution. Both Protestant and Catholic authorities felt threatened by the social, political, and economic implications of radicals’ religious ideas and by their rejection of a state church. Their community spirit and heroism in the face of martyrdom, however, contributed to the survival of radical ideas. In 1787 the authors of the U.S. Constitution, with their opposition to the “establishment of religion” (state churches), would trace the origins of their beliefs, in part, to the radicals of the sixteenth century.

Another group to challenge state authorities was the peasantry. In the early sixteenth century the economic condition of peasants varied from place to place but was generally worse than it had been in the fifteenth century and was deteriorating. Peasants demanded limitations on the new taxes and labor obligations their noble landlords were imposing. They believed that their demands conformed to the Scriptures and cited Luther as a theologian who could prove that they did.

Wanting to prevent rebellion, Luther initially sided with the peasants. But when rebellion broke out, the peasants who expected Luther’s support were soon disillusioned. Freedom for Luther meant independence from the authority of the Roman Church, not opposition to legally established secular powers. Firmly convinced that rebellion would hasten the end of civilized society, he wrote the tract *Against the Murderous, Thieving*

Hordes of the Peasants. The nobility ferociously crushed the revolt, which became known as the German Peasants’ War of 1525.

The Peasants’ War greatly strengthened the authority of lay rulers. Because Luther turned against the peasants who revolted, the Reformation lost much of its popular appeal after 1525, though peasants and urban rebels sometimes found a place for their social and religious ideas in radical groups. Peasants’ economic conditions did moderately improve, however.

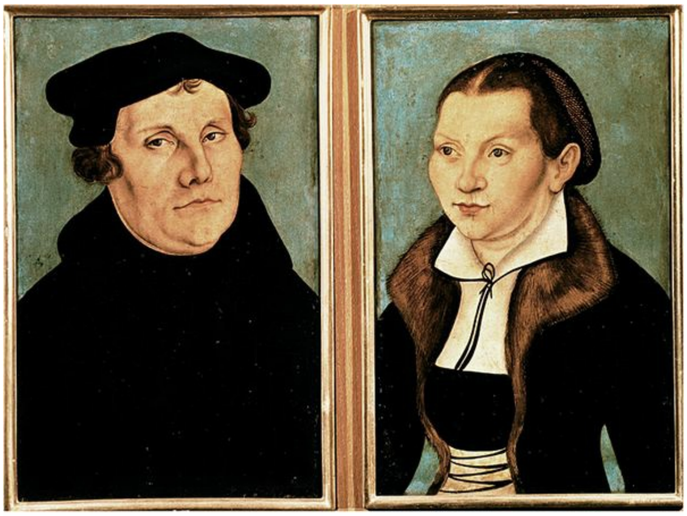
Marriage and Women’s Roles

Luther and other Protestants believed that a priest’s or nun’s vows of celibacy went against human nature and God’s commandments. Luther married a former nun, Katharina von Bora (1499–1532), who quickly had several children. Most other Protestant reformers also married, and their wives had to create a new and respectable role for themselves, pastor’s wife. They were living demonstrations of their husband’s convictions about the superiority of marriage to celibacy, and they were expected to be models of wifely obedience and Christian charity.

Catholics viewed marriage as a sacramental union that, if validly entered into, could not be dissolved. Protestants saw marriage as a contract in which each partner promised the other support, companionship, and the sharing of mutual goods. They believed that spouses who did not comfort or support one another endangered their own souls and the surrounding community; therefore, most Protestants came to allow divorce. Divorce remained rare, however, because marriage was such an important social and economic institution.

Protestants did not break with medieval scholastic theologians in their view that, within marriage, women were to be subject to men. Men were urged to treat their wives kindly and considerately, but also to enforce their authority, through physical coercion if necessary. A few women took the Protestant idea about the priesthood of all believers to heart and wrote religious pamphlets and hymns, but no sixteenth-century Protestants officially allowed women to hold positions of religious authority.

Because the Reformation generally brought the closing of monasteries and convents, marriage became virtually the only occupation for upper-class Protestant women. Recognizing this, women in some convents fought the Reformation or argued that they could still be pious Protestants within convent walls. Most nuns left, however, and we do not know what happened to them. The Protestant emphasis on marriage made unmarried women (and men) suspect, for they did not belong to the type of household regarded as the cornerstone of a proper, godly society.



Galleria degli Uffizi, Florence, Italy/akg-images

Martin Luther and Katharina von Bora Lucas Cranach the Elder painted this double marriage portrait to celebrate Luther's wedding in 1525 to Katharina von Bora, a former nun. The artist was one of the witnesses at the wedding and, in fact, had presented Luther's marriage proposal to Katharina. The couple quickly became a model of the ideal marriage, and many churches wanted their portraits. More than sixty similar paintings, with slight variations, were produced by Cranach's workshop and hung in churches and wealthy homes.

The Reformation and German Politics

Criticism of the church was widespread in Europe in the early sixteenth century. Yet such movements could be more easily squelched by the strong central governments of Spain, France, and England. The Holy Roman Empire, in contrast, included hundreds of largely independent states in which the emperor had far less authority than did the monarchs of western Europe. Thus local rulers of the many states in the empire continued to exercise great power.

Luther's ideas appealed to local rulers within the empire for a variety of reasons. Though Germany was not a nation, people did have an understanding of being German because of their language and traditions. Luther frequently used the phrase "we Germans" in his attacks on the papacy, and his appeal to national feeling influenced many rulers. Also, while some German rulers were sincerely attracted to Lutheran ideas, material considerations swayed many others to embrace the new faith. The rejection of Roman Catholicism and the adoption of Protestantism would mean the legal confiscation of valuable church property. Thus many political authorities in the empire used the religious issue to extend their financial and political power and to enhance their independence from the emperor.

The Habsburg Charles V, elected as emperor in 1521, was a vigorous defender of Catholicism, so it is not surprising that the Reformation led to religious wars. Protestant territories in the empire formed military alliances, and the emperor could not oppose them effectively given other military engagements. In southeastern Europe Habsburg troops were already fighting the Ottoman Turks. Habsburg soldiers were also engaged in a series of wars with the Valois (VAL-wah) kings of France that stretched from 1494 to 1559. The cornerstone of French foreign policy in the sixteenth and seventeenth centuries was the desire to keep the German states divided. Thus Europe witnessed the paradox of the Catholic king of France supporting Lutheran princes in their challenge to his fellow Catholic, Charles V.

Finally, in 1555, Charles agreed to the Peace of Augsburg, which officially recognized Lutheranism and ended religious war in Germany for many decades. Under this treaty, the political authority in each territory of the Holy Roman Empire was permitted to decide whether the territory would be Catholic or Lutheran. His hope of uniting his empire under a single church dashed, Charles V abdicated in 1556, transferring power over his Spanish and Netherlandish holdings to his son Philip II and his imperial power to his brother Ferdinand.

England’s Shift Toward Protestantism

As on the continent, the Reformation in England had economic and political as well as religious causes. The impetus for England’s break with Rome was the desire of King Henry VIII (r. 1509–1547) for a new wife. When the personal matter of his need to divorce his first wife became enmeshed with political issues, a complete break with Rome resulted.

In 1527, after eighteen years of marriage, Henry’s wife Catherine of Aragon had failed to produce a male child, and Henry had also fallen in love with a court lady in waiting, Anne Boleyn. So Henry petitioned Pope Clement VII for an annulment of his marriage to Catherine. When the pope procrastinated in granting the annulment, Henry decided to remove the English Church from papal authority.

Henry used Parliament to legalize the Reformation in England and to make himself the supreme head of the Church of England. Anne had a daughter, Elizabeth, but failed to produce a son, so Henry VIII charged her with adulterous incest and in 1536 had her beheaded. His third wife, Jane Seymour, gave Henry the desired son, Edward, but she died a few days after childbirth. Henry went on to three more wives.

Between 1535 and 1539 Henry decided to dissolve the English monasteries primarily because he wanted their wealth. Hundreds of former church properties were sold to the middle and upper classes, strengthening the upper classes and tying them to the Tudor dynasty, to which Henry belonged. How did everyday people react to Henry's break from the Catholic Church? Recent scholarship points out that people rarely "converted" from Catholicism to Protestantism overnight. Instead they responded to the local consequences of the shift from Catholicism with a combination of resistance, acceptance, and collaboration.

Loyalty to the Catholic Church remained particularly strong in Ireland. Ireland had been claimed by English kings since the twelfth century, but in reality the English had firm control of only the area around Dublin known as the Pale. In 1536, on orders from London, the Irish Parliament, which represented only the English landlords and the people of the Pale, approved the English laws severing the church from Rome. The (English) ruling class adopted the new reformed faith, but most of the Irish people remained Roman Catholic. Irish armed opposition to the Reformation led to harsh repression by the English.

In the short reign of Henry's sickly son Edward VI (r. 1547–1553), strongly Protestant ideas exerted a significant influence on the religious life of the country. The equally brief reign of Mary Tudor (r. 1553–1558), the devoutly Catholic daughter of Catherine of Aragon, witnessed a sharp move back to Catholicism, and many Protestants fled to the continent. Mary's death raised to the throne her half sister Elizabeth (r. 1558–1603) and inaugurated the beginning of religious stability.

Elizabeth had been raised a Protestant, but at the start of her reign sharp differences existed in England. On the one hand, Catholics wanted a Roman Catholic ruler. On the other hand, a vocal number of returning exiles wanted all Catholic elements in the Church of England eliminated. Members of the latter group were called Puritans. Shrewdly, Elizabeth chose a middle course between Catholic and Puritan extremes. The Anglican Church, as the Church of England was called, moved in a moderately Protestant direction.

Calvinism and Its Moral Standards

John Calvin (1509–1564) was born in Noyon in northwestern France. As a young man he studied law, but in 1533 he experienced a religious crisis, as a result of which he converted from Catholicism to Protestantism. Calvin believed that God had specifically selected him to reform the church. Accordingly, he accepted an invitation to assist in the reformation of the city of Geneva. There, beginning in 1541, Calvin worked to establish a Christian society ruled by God through civil magistrates and reformed ministers.

Calvin’s ideas are embodied in *The Institutes of the Christian Religion*, first published in 1536 and modified several times afterward. The cornerstone of Calvin’s theology was his belief in the absolute sovereignty and omnipotence of God and the total weakness of humanity.

Calvin did not ascribe free will to human beings because that would detract from the sovereignty of God. According to his beliefs, men and women could not actively work to achieve salvation; rather, God decided at the beginning of time who would be saved and who damned. This viewpoint constitutes the theological principle called **predestination**. “This terrible decree,” as even Calvin called it, did not lead to pessimism or fatalism. Instead, although Calvinists believed that one’s own actions could do nothing to change one’s fate, many came to believe that hard work, thrift, and moral conduct could serve as signs that one was among the “elect” chosen for salvation. Any occupation or profession could be a God-given “calling” and should be carried out with diligence and dedication.

predestination Calvin’s teaching that God decided at the beginning of time who would be saved and who damned, so people could not actively work to achieve salvation.

Calvin transformed Geneva into a community based on his religious principles. The most powerful organization in the city became the Consistory, a group of laymen and pastors charged with investigating and disciplining deviations from proper doctrine and conduct. (See “Global Viewpoints: Chinese and European Views on Proper Behavior,” above.)

Religious refugees from France, England, Spain, Scotland, and Italy visited Calvin’s Geneva, which became the model of a Christian community for many. Subsequently, the Reformed Church of Calvin served as the model for the Presbyterian Church in Scotland, the Huguenot (HYOO-guh-naht) Church in France, and the Puritan Churches in England and New England. Calvinism became the compelling force in international Protestantism, first in Europe and then in many Dutch and English colonies around the world.

GLOBAL VIEWPOINTS

Chinese and European Views on Proper Behavior

Protestant reformers in Europe had clear ideas about virtuous behavior and how to encourage it, and the same was true of Neo-Confucian scholar-officials in China (see “The Scholar-Officials and Neo-Confucianism” in Chapter 13). The reformer John Calvin designed ordinances for the city of Geneva that regulated public and family life, while in China the official and military leader Wang Yangming (1472–1529) called for “community compacts,” agreements between community members in which all pledged to act in a moral fashion.

Wang Yangming, Community Compact for Southern Ganzhou, 1520s

■ Nothing can be done to change what has already gone by, but something can still be done in the future. Therefore a community compact is now specially prepared to unite and harmonize all of you.

From now on, all of you who enter into this compact should be filial to your parents and respectful to your elders, teach your children, live in harmony with your fellow villagers, help one another when there is death in the family and assist one another in times of difficulty, encourage one another to do good and warn one another not to do evil, stop litigations and rivalry, cultivate faithfulness and promote harmony, and be sure to be good citizens so that together you may establish the custom of humanity and kindness....

Elect from the compact membership an elderly and virtuous person respected by all to be the compact chief and two persons to be assistant chiefs [and other officials].... Have three record books. One of these is to record the names of compact members and their daily movements and activities, and is to be in the charge of the compact executives. Of the remaining record books, one is for the purpose of displaying good deeds and the other for the purpose of reporting evil deeds.... To display good deeds, the language used must be clear and decisive, but in reporting mistakes, the language must be indirect and gentle.

John Calvin, Ecclesiastical Ordinances for the City of Geneva, 1541

■ [The office of the elders appointed to the Consistory] is to keep watch over the lives of everyone, to admonish in love those whom they see in error and leading disorderly lives. Whenever necessary they shall make a report concerning these to the ministers who will be designated to make brotherly corrections....

If the church deems it wise, it will be well to choose two from the Little Council, four from the Council of Two Hundred, honest men of good demeanor, without reproach and free from all suspicion, above all fearing God and possessed of good and spiritual judgment. It will be well to elect them from every part of the city so as to be able to maintain supervision over all….

If there shall be anyone who lays down opinions contrary to received doctrine, he is to be summoned. If he recants, he is to be dismissed without prejudice. If he is stubborn, he is to be admonished from time to time until it shall be evident that he deserves greater severity….

If anyone is negligent in attending worship so that a noticeable offense is evident for the communion of the faithful, or if anyone shows himself contemptuous of ecclesiastical discipline, he is to be admonished….

For the correction of faults, it is necessary to proceed after the ordinance of our Lord. That is, vices are to be dealt with secretly and no one is to be brought before the church for accusation if the fault is neither public nor scandalous, unless he has been found rebellious in the matter….

Let all these measures be moderate; let there not be such a degree of rigor that anyone should be cast down, for all corrections are but medicinal, to bring back sinners to the Lord.

QUESTIONS FOR ANALYSIS

1. What types of actions do Wang and Calvin encourage and discourage?
2. What similarities and differences do you see in the institutions and procedures Wang and Calvin established to enforce proper conduct?
3. How do these documents reflect Confucian and Protestant Christian values and ideals?

The Catholic Reformation

How did the Catholic Church respond to the new religious situation?

Between 1517 and 1547 Protestantism made remarkable advances. Nevertheless, the Roman Catholic Church made a significant comeback (Map 15.2). Many historians see the developments within the Catholic Church after the Protestant Reformation as two interrelated movements, one a drive for internal reform, and the other a Counter-Reformation that actively opposed Protestantism. In both movements, papal reforms and new religious orders were important agents.

Mapping the Past

MAP 15.2 Religious Divisions in Europe, ca. 1555 The Reformation shattered the religious unity of Western Christendom. The situation was even more complicated than a map of this scale can show. Many cities within the Holy Roman Empire, for example, accepted a different faith than did the surrounding countryside; Augsburg, Basel, and Strasbourg were all Protestant, though surrounded by territory ruled by Catholic nobles.

ANALYZING THE MAP Which countries in Europe were the most religiously diverse? Which were the least diverse?

CONNECTIONS Where was the first arena of religious conflict in Europe, and why did it develop there and not elsewhere? What nonreligious factors contributed to the religious divisions that developed in sixteenth-century Europe, and to what degree can they explain these divisions?

Papal Reforms and the Council of Trent

Under Pope Paul III (pontificate 1534–1549) the papal court became the center of a reform movement within the Catholic Church. In 1542 he established the Supreme Sacred Congregation of the Roman and Universal Inquisition, often called the Holy Office, with jurisdiction over the Roman Inquisition, a powerful instrument of the Catholic Reformation. The Inquisition had judicial authority over all Catholics and the power to arrest, imprison, and execute.

Pope Paul III also called a general council, which met intermittently from 1545 to 1563 at Trent, an imperial city close to Italy. The decrees of the Council of Trent laid a solid basis for the spiritual renewal of the Catholic Church. It gave equal validity to the Scriptures and to tradition as sources of religious truth and authority. It reaffirmed the seven sacraments and the traditional Catholic teaching on transubstantiation (the transformation of bread and wine into the body and blood of Christ in the Eucharist). It tackled the disciplinary matters that had disillusioned the faithful. The council also required every diocese to establish a seminary for educating and training clergy. Finally, great emphasis was placed on preaching to and instructing the laity, especially the uneducated. For four centuries the doctrinal and disciplinary legislation of Trent served as the basis for Roman Catholic faith, organization, and practice.

New Religious Orders

Just as seminaries provided education, so did new religious orders, which aimed to raise the moral and intellectual level of the clergy and people. The Ursuline (UHR-suh-luhn) order of nuns, founded in 1535 by Angela Merici (1474–1540), attained enormous prestige for its education of women. The Ursulines were the first women’s religious order concentrating exclusively on teaching young girls, with the goal of re-Christianizing society by training future wives and mothers. After receiving papal approval in 1565, the Ursulines rapidly spread to France and the New World.

Teresa of Ávila In this wood carving from 1625, the Spanish artist Gregorio Fernandez shows Saint Teresa book in hand, actively teaching. The influence of her ideas and actions led the pope to give Teresa the title "Doctor of the Church" in 1970, the first woman to be so honored.

Another important new order was the Society of Jesus, or **Jesuits**. Founded by Ignatius Loyola (1491–1556), and approved by the pope in 1540, this order played a powerful international role in strengthening Catholicism in Europe and spreading the faith around the world. Under Loyola's leadership, the Society of Jesus developed into a highly centralized, tightly knit organization whose professed members vowed to go anywhere the pope said they were needed. They established schools that adopted the modern humanist curricula and methods and that educated the sons of the nobility as well as the poor. The Jesuits attracted many recruits and achieved phenomenal success for the papacy and the reformed Catholic Church, carrying Christianity to much of South and Central America, India, and Japan before 1550 and to Brazil, North America, and the Congo in the seventeenth century. Within Europe the Jesuits brought almost all of southern Germany and much of eastern Europe back to Catholicism. Also, as confessors and spiritual directors to kings, Jesuits exerted great political influence.

Religious Violence

What were the causes and consequences of religious violence, including riots, wars, and witch-hunts?

In 1559 France and Spain signed the Treaty of Cateau-Cambrésis (KAH-toh cahm-BREH-sis), which ended the long conflict known as the Habsburg-Valois wars. However, over the next century religious differences led to riots, civil wars, and international conflicts. Especially in France and the Netherlands, Protestants and Catholics opposed one another through preaching, teaching, and violence. Catholics and Protestants alike feared people of other faiths, whom they often saw as agents of Satan. Even more, they feared those explicitly identified with Satan: people believed to be witches. This era also saw the most virulent witch persecutions in European history, as both Protestants and Catholics tried to make their cities and states more godly.

French Religious Wars

The costs of the Habsburg-Valois wars, waged intermittently through the first half of the sixteenth century, forced the French to increase taxes and borrow heavily. King Francis I's treaty with the pope (see "Politics and the State in the Renaissance") gave the French crown a rich supplement of money and offices and also a vested financial interest in Catholicism. Significant numbers of French people, however, were attracted to Calvinism. Calvinism drew converts from among reform-minded members of the Catholic clergy, the industrious middle classes, and artisan groups. Additionally, some French nobles became Calvinist. By the middle of the sixteenth century perhaps one-tenth of the French population had become **Huguenots**, the name given to French Calvinists.

Huguenots French Calvinists.

Both Calvinists and Catholics believed that the others' books, services, and ministers polluted the community. Preachers communicated these ideas in sermons, triggering religious violence. Armed clashes between Catholic royalist nobles and Calvinist antimonarchical nobles occurred in many parts of France.

Calvinist teachings called the power of sacred images into question, and mobs in many cities destroyed statues, stained-glass windows, and paintings. Catholic mobs responded by defending the sacred images, and crowds on both sides killed their opponents, often in gruesome ways.

A particularly savage Catholic attack on Calvinists took place in Paris on August 24, 1572, Saint Bartholomew's Day. The occasion was the marriage of the king's sister Margaret of Valois to the Protestant Henry of Navarre, which was intended to help reconcile Catholics and Huguenots. Instead Huguenot wedding guests in Paris were massacred, and other Protestants were slaughtered by mobs. Violence spread to the provinces, where thousands were killed. The Saint Bartholomew's Day massacre led to a civil war that dragged on for fifteen years.

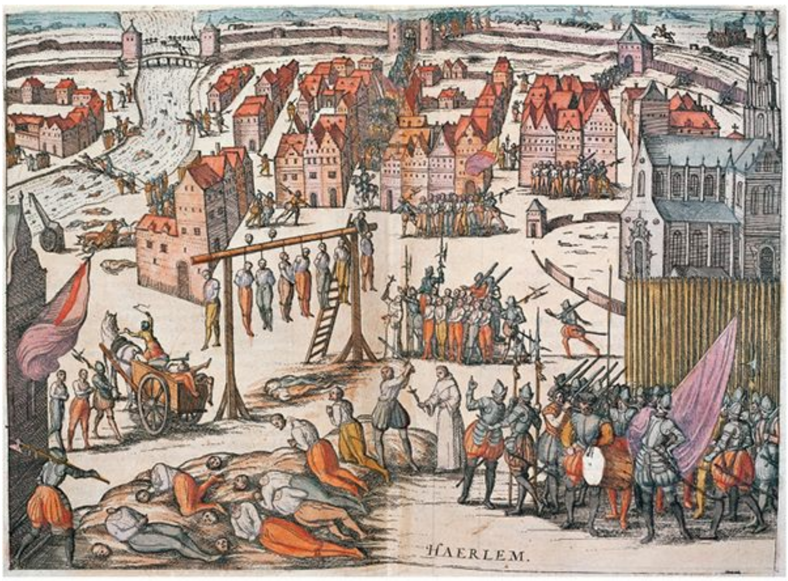
What ultimately saved France was a small group of moderates of both faiths called **politiques** (POH-lee-teeks), who believed that only the restoration of a strong monarchy could reverse the trend toward collapse. The politiques also favored officially recognizing the Huguenots. The death of the French queen Catherine de' Medici, followed by the assassination of her son King Henry III, paved the way for the accession of Henry of Navarre (the unfortunate bridegroom of the Saint Bartholomew's Day massacre), a politique who became Henry IV (r. 1589–1610).

politiques Catholic and Protestant moderates who sought to end the religious violence in France by restoring a strong monarchy and granting official recognition to the Huguenots.

Henry's willingness to sacrifice religious principles to political necessity saved France. He converted to Catholicism but also, in 1598, issued the Edict of Nantes (NAHNT), which granted liberty of conscience (freedom of thought) and liberty of public worship to Huguenots in 150 fortified towns. By helping restore internal peace in France, the reign of Henry IV and the Edict of Nantes paved the way for French kings to claim absolute power in the seventeenth century.

Civil Wars in the Netherlands

In the Netherlands a movement for church reform developed into a struggle for Dutch independence. The Catholic emperor Charles V had inherited the seventeen provinces that compose present-day Belgium and the Netherlands (see "The Habsburgs"). In the Netherlands, as in many other places, Lutheran ideas took root. Charles V had grown up in the Netherlands, however, and he was able to limit the impact of the new ideas. As discussed earlier, Charles V abdicated in 1556 and transferred power over the Netherlands to his son Philip II, who had grown up in Spain. Although Philip, like his father, opposed Protestantism, Protestant ideas spread in the Netherlands.



Private Collection/Bridgeman Images

Spanish Soldiers Killing Protestants in Haarlem In this 1573 engraving by the Calvinist artist Franz Hogenberg, Spanish soldiers accompanied by priests kill residents of the Dutch city of Haarlem by hanging or beheading, and then dump their bodies in the river. Haarlem had withstood a seven-month siege by Spanish troops in 1572–1573, and after the starving city surrendered, the garrison of troops and forty citizens judged guilty of sedition were executed. Images such as this were part of the propaganda battle that accompanied the wars of religion, but in many cases there were actual atrocities, on both sides.

By the 1560s Protestants in the Netherlands were primarily Calvinists. When Spanish authorities attempted to suppress Calvinist worship and raised taxes, their actions sparked riots and a wave of iconoclasm. In response, Philip II sent twenty thousand Spanish troops, and from 1568 to 1578 civil war raged in the Netherlands between Catholics and Protestants and between the seventeen provinces and Spain. Eventually the ten southern provinces came under the control of the Spanish Habsburg forces. The seven northern provinces, led by Holland, formed the Union of Utrecht (the United Provinces), and in 1581 they declared their independence from Spain. The north was Protestant, and the south remained Catholic. Philip did not accept the independence of the north, and war continued. England was even drawn into the conflict, supplying money and troops to the United Provinces. (Spain launched the Spanish Armada, an unsuccessful invasion of England, in response.) Hostilities ended in 1609 when Spain agreed to a truce that recognized the independence of the United Provinces.

The Great European Witch-Hunt

Insecurity created by the religious wars contributed to persecution for witchcraft, which actually began before the Reformation in the 1480s but became especially common about 1560. Both Protestants and Catholics tried and executed those accused of being witches.

The heightened sense of God’s power and divine wrath in the Reformation era was an important factor in the **witch-hunts**, but other factors were also significant. In the later Middle Ages, scholars and officials added a demonological component to existing ideas about witches. For them, the essence of witchcraft was making a pact with the Devil that required the witch to do the Devil’s bidding. Witches were no longer simply people who used magical power to do harm and get what they wanted, but rather people used by the Devil to do what he wanted.

witch-hunts Campaign against witchcraft in Europe and European colonies during the sixteenth and seventeenth centuries in which hundreds of thousands of people, mostly women, were tried, and many of them executed.

Trials involving this new notion of witchcraft as diabolical heresy began in Switzerland and southern Germany in the late fifteenth century; became less numerous in the early decades of the Reformation, when Protestants and Catholics were busy fighting each other; and then picked up again about 1560, spreading to much of western Europe and to European colonies in the Americas. Scholars estimate that during the sixteenth and seventeenth centuries somewhere between 100,000 and 200,000 people were officially tried for witchcraft, and between 40,000 and 60,000 were executed.

Though the gender balance of the accused varied widely in different parts of Europe, between 75 and 85 percent of those tried and executed were women, whom some demonologists viewed as weaker and so more likely to give in to the Devil. Tensions within families, households, and neighborhoods also played a role in witchcraft accusations, as grievances and jealousies led to accusations. Suspects were questioned and tortured by legal authorities, and they often implicated others.

Even in the sixteenth century a few individuals questioned whether witches could ever do harm, make a pact with the Devil, or engage in the wild activities attributed to them. Furthermore, doubts about trial procedures and the use of torture to extract confessions gradually spread among the same type of religious and legal authorities who had so vigorously persecuted witches. By about 1660 prosecutions for witchcraft had become less common.

European ideas about witchcraft traveled across the Atlantic. There were a few trials of European colonists for witchcraft — the most famous of which was at Salem in Massachusetts — but more often indigenous people were accused of being witches.

Chapter Summary

The Renaissance was characterized by self-conscious awareness among educated Europeans, particularly scholars and writers known as humanists, that they were living in a new era. Central to humanists were interest in the Latin classics, belief in individual potential, education for a career of public service, and, in northern Europe, the reform of church and society. Their ideas spread as a result of the development of the printing press with movable metal type, which revolutionized communication. Interest in the classical past and in the individual shaped the style and subject matter of Renaissance art, and patrons provided the money needed for an outpouring of painting, sculpture, and architecture. Social hierarchies in the Renaissance developed new features that contributed to the modern social hierarchies of race, class, and gender. In politics, feudal monarchies gradually evolved into nation-states, as rulers used war, diplomacy, new forms of taxation, centralized institutions, and strategic marital alliances to build up their power.

Many individuals and groups had long called for reforms in the Catholic Church, providing a ready audience in the early sixteenth century for the ideas of Martin Luther. Luther and other reformers, called Protestants, developed a new understanding of Christian doctrine that emphasized faith and grace; Protestant ideas spread rapidly through preaching, hymns, and the printing press; and soon western Europe was split religiously. Local situations influenced religious patterns. In England the king’s need for a church-approved divorce triggered the break with Rome, while in France and eastern Europe the ideas of John Calvin gained wide acceptance. By the middle of the sixteenth century the Roman Catholic Church had begun a process of internal reform along with opposing Protestants intellectually, politically, militarily, and institutionally. This reinvigorated Catholic Church would carry Christian ideas around the world, while in Europe religious differences led to riots, witch persecutions, civil wars, and international conflicts.

CONNECTIONS

The Renaissance and the Reformation are often seen as key to the creation of the modern world. The radical changes of these times contained many elements of continuity, however. Artists, humanists, and religious reformers looked back to the classical era and early Christianity for inspiration. Political leaders played important roles in cultural and religious developments, just as they had for centuries in Europe and other parts of the world. Social hierarchies of race, status, and gender built on those of earlier periods. Thinkers highlighted individual achievement, but families, religious brotherhoods, and other groups remained important. The events of the Renaissance and Reformation were thus linked with earlier developments, and they were also closely connected with another important element in the modern world: European exploration and colonization (discussed in Chapter 16). Renaissance monarchs paid for maritime expeditions, expecting a large share of any profits gained and increasingly viewing overseas territory as essential to their own reputations and to a strong state. Moreover, for many, European expansion had a religious dimension and was explicitly linked to the spread of Christianity around the world. The desire for fame, wealth, and power that was central to the Renaissance, and the religious zeal central to the Reformation, were thus key to the European voyages and to colonial ventures as well.

CHAPTER 15 Review and Explore

Identify Key Terms

Identify and explain the significance of each item below.

Review the Main Ideas

Answer the focus questions from each section of the chapter.

1. What were the major cultural developments of the Renaissance? (p. 408)
2. What were the key social hierarchies in Renaissance Europe, and how did these hierarchies shape people's lives? (p. 415)
3. How did the nation-states of western Europe evolve in this period? (p. 418)
4. What were the central ideas of Protestant reformers, and why were they appealing to various groups across Europe? (p. 419)
5. How did the Catholic Church respond to the new religious situation? (p. 428)
6. What were the causes and consequences of religious violence, including riots, wars, and witch-hunts? (p. 430)

Make Comparisons and Connections

Analyze the larger developments and continuities within and across chapters.

1. The word *Renaissance*, invented to describe the cultural flowering in Italy that began in the fourteenth century, has often been used for other periods of advance in learning and the arts, such as the "Carolingian Renaissance" that you read about in Chapter 8. Can you think of other, more recent

"Renaissances" or ways the term is used today?

2. The "debate about women" that you read about in this chapter was not simply a European phenomenon, as educated men (and occasionally a few educated women) in many cultures discussed women's nature and character. How would you compare ideas about women in classical Islamic society (Chapter 9), Song China (Chapter 13), Heian Japan (Chapter 13), Renaissance Italy, and Protestant Germany? How were these ideas reflected (or not reflected) in women's actual lives?
3. Martin Luther is always on every list of the one hundred most influential individuals of all time. Should he be? Why or why not? Who else from this chapter (or other chapters) should be on such a list, and why?

The Protestant Revolution (BBC, 2007). A four-part documentary series that examines the religious roots and the scientific, cultural, social, economic, and political impact of Protestantism, viewing these as wide-ranging and global in scope.

Feature Films and Television Dramas

The Borgias (Showtime, 2011). A fictionalized docudrama of the rise of the Borgia family to power in the church and in Italy, with Jeremy Irons as Pope Alexander VI.
Luther (Eric Till, 2003). A fairly accurate biopic, starring Joseph Fiennes, which traces Martin Luther's life from his becoming a monk through his break with the church, his marriage, and the German Peasants' War.
Wolf Hall (BBC, 2015). A miniseries based on the award-winning historical novels by Hilary Mantel that focuses on Thomas Cromwell, Henry VIII's chief minister. Praised for its acting and staging, but criticized for its harsh treatment of Thomas More.

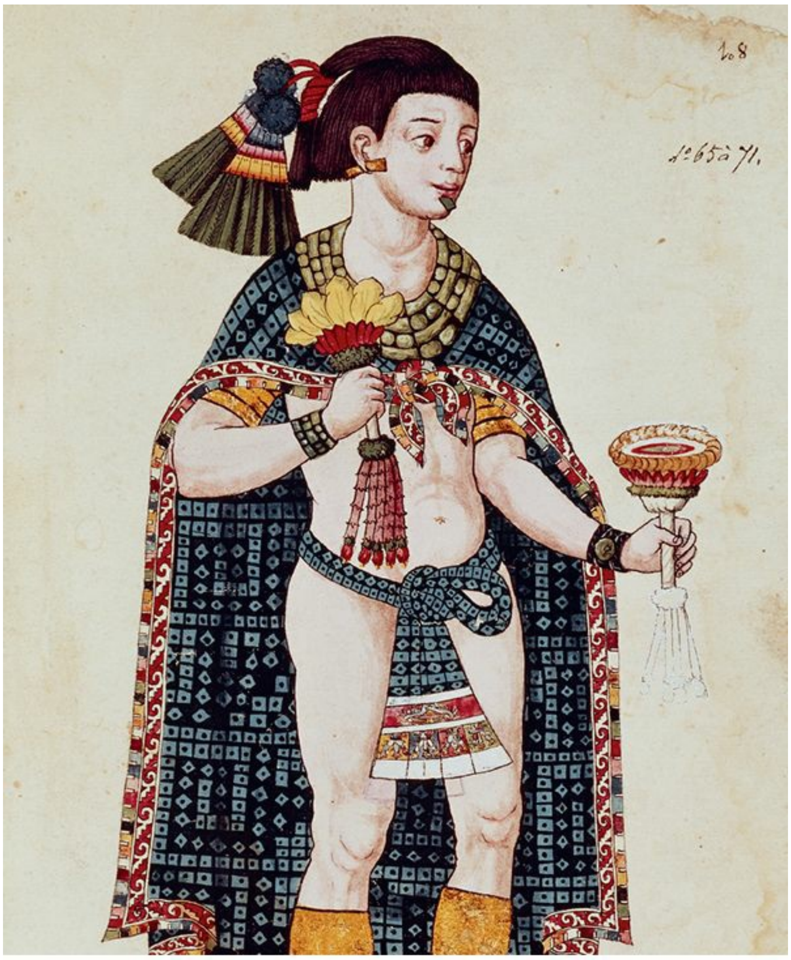
The Acceleration of Global Contact

1450–1600



From *Codex Ixtlilxochiti*, 1582, pigment on European paper/Bibliothèque Nationale, Paris, France/De Agostini Picture Library/akg-images

Nezahualpilli

At the time of the arrival of Europeans, Nezahualpilli was ruler of the city-state of Texcoco, the second-most-important city in the Aztec Empire after Tenochtitlan.

Before 1500 Europeans were relatively marginal players in a centuries-old tradin system that linked Africa, Asia, and Europe. The Indian Ocean was the locus of a vibrant cosmopolitan Afroeurasian trade world in which Arab, Persian, Turkish, Indian, African, Chinese, and European merchants and adventurers competed for trade in spices, silks, and other goods. Elites everywhere prized Chinese porcelains and silks, while wealthy members of the Celestial Kingdom, as China called itself, wanted gold, ivory, and rhinoceros horn from Africa and exotic goods and peacocks from India. African people wanted textiles from India and cowrie shells from the Maldives in the Indian Ocean. Europeans craved Asian silks and spices, but they had few desirable goods to offer their trading partners.

By 1550 the European search for better access to Asian trade goods had led to a new overseas empire in the Indian Ocean and the accidental discovery of the Western Hemisphere. With this discovery South and North America were drawn into an international network of trade centers and political empires, which Europeans came to dominate. The era of globalization had begun, creating new political systems and forms of economic exchange as well as cultural assimilation, conversion, and resistance.

The Afroeurasian Trade World

What was the Afroeurasian trade world prior to the era of European exploration?

The Afroeurasian trade world linked the products and people of Europe, Asia, and Africa in the fifteenth century. The West was a marginal player in this trading system. Nevertheless, wealthy Europeans were eager consumers of luxury goods from the East, which they received through Italian middlemen.

The Trade World of the Indian Ocean

The Indian Ocean was the center of the Afroeurasian trade world, serving as a crossroads for commercial and cultural exchanges between China, India, the Middle East, Africa, and Europe (Map 16.1). From the seventh through the fourteenth centuries, the volume of this trade steadily increased, declining only during the years of the Black Death.

MAP 16.1 The Fifteenth-Century Afroeurasian Trading World After a period of decline following the Black Death and the Mongol invasions, trade revived in the fifteenth century. Muslim merchants dominated trade, linking ports in East Africa and the Red Sea with those in India and the Malay Archipelago. The Chinese admiral Zheng He followed the most important Indian Ocean trade routes on his voyages (1405–1433), hoping to impose Ming dominance of trade and tribute.

Merchants congregated in a series of multicultural, cosmopolitan port cities strung around the Indian Ocean. Most of these cities had some form of autonomous self-government, and mutual self-interest largely limited violence and prevented attempts to monopolize trade. The most developed area of this commercial web was made up of the ports surrounding the South China Sea. In the fifteenth century the port of Malacca became a great commercial entrepôt (AHN-truh-poh), a trading center to which goods were shipped for storage while awaiting redistribution. To Malacca came porcelains, silks, and camphor (used in the manufacture of many medications) from China; pepper, cloves, nutmeg, and raw materials such as sandalwood from the Moluccas; sugar from the Philippines; and textiles, copper weapons, incense, dyes, and opium from India.

The Mongol emperors opened the doors of China to the West, encouraging Europeans like the Venetian trader and explorer Marco Polo to do business there. Marco Polo’s tales of his travels from 1271 to 1295 and his encounter with the Great Khan fueled Western fantasies about the Orient. After the Mongols fell to the Ming Dynasty in 1368, China entered a period of agricultural and commercial expansion, population growth, and urbanization (see “Ming China” in Chapter 21). Historians agree that China had the most advanced economy in the world until at least the beginning of the eighteenth century.

China also took the lead in exploration, sending Admiral Zheng He’s fleet as far west as Egypt. Each of his seven expeditions from 1405 to 1433 involved hundreds of ships and tens of thousands of men. The purpose of the voyages was primarily diplomatic, to enhance China’s prestige and seek tribute-paying alliances. The high expense of the voyages in a period of renewed Mongol encroachment led to the abandonment of the maritime expeditions after the deaths of Zheng He and the emperor. China’s turning away from external trade opened new opportunities for European states to expand their role in Asian trade.

Another center of Indian Ocean trade was India, the crucial link between the Persian Gulf and the Southeast Asian and East Asian trade networks. The subcontinent had ancient links with its neighbors to the northwest. Trade among ports bordering the Indian Ocean was revived in the Middle Ages by Arab merchants who circumnavigated India on their way to trade in the South China Sea. The inhabitants of India's Coromandel coast traditionally looked to Southeast Asia, where they had ancient trading and cultural ties. Hinduism and Buddhism arrived in Southeast Asia from India during late antiquity, and a brisk trade between Southeast Asian and Coromandel port cities persisted from that time until the arrival of the Portuguese in the sixteenth century. India itself was an important contributor of goods to the world trading system. Most of the world's pepper was grown in India, and Indian cotton and silk textiles were also highly prized.

Peoples and Cultures of the Indian Ocean

Indian Ocean trade connected peoples from the Malay Peninsula (the southern extremity of the Asian continent), India, China, and East Africa, among whom there was an enormous variety of languages, cultures, and religions. In spite of this diversity, certain sociocultural similarities linked these peoples, especially in Southeast Asia.

In comparison to India, China, or even Europe after the Black Death, Southeast Asia was sparsely populated. People were concentrated in port cities and in areas of intense rice cultivation. Another difference between Southeast Asia and India, China, and Europe was the higher status of women — their primary role in planting and harvesting rice gave them authority and economic power. At marriage, which typically occurred around age twenty, the groom paid the bride (or sometimes her family) a sum of money called **bride wealth**, which remained under her control. This practice was in sharp contrast to the Chinese, Indian, and European dowry, which came under the husband's control. Property was administered jointly, in contrast to the Chinese principle and Indian practice that wives had no say in the disposal of family property. All children, regardless of gender, inherited equally.

bride wealth In early modern Southeast Asia, a sum of money the groom paid the bride or her family at the time of marriage. This practice contrasted with the dowry in China, India, and Europe, which the husband controlled.

Respect for women carried over to the commercial sphere. Women participated in business as partners and independent entrepreneurs. When Portuguese and Dutch men settled in the region and married local women, their wives continued to play important roles in trade and commerce.

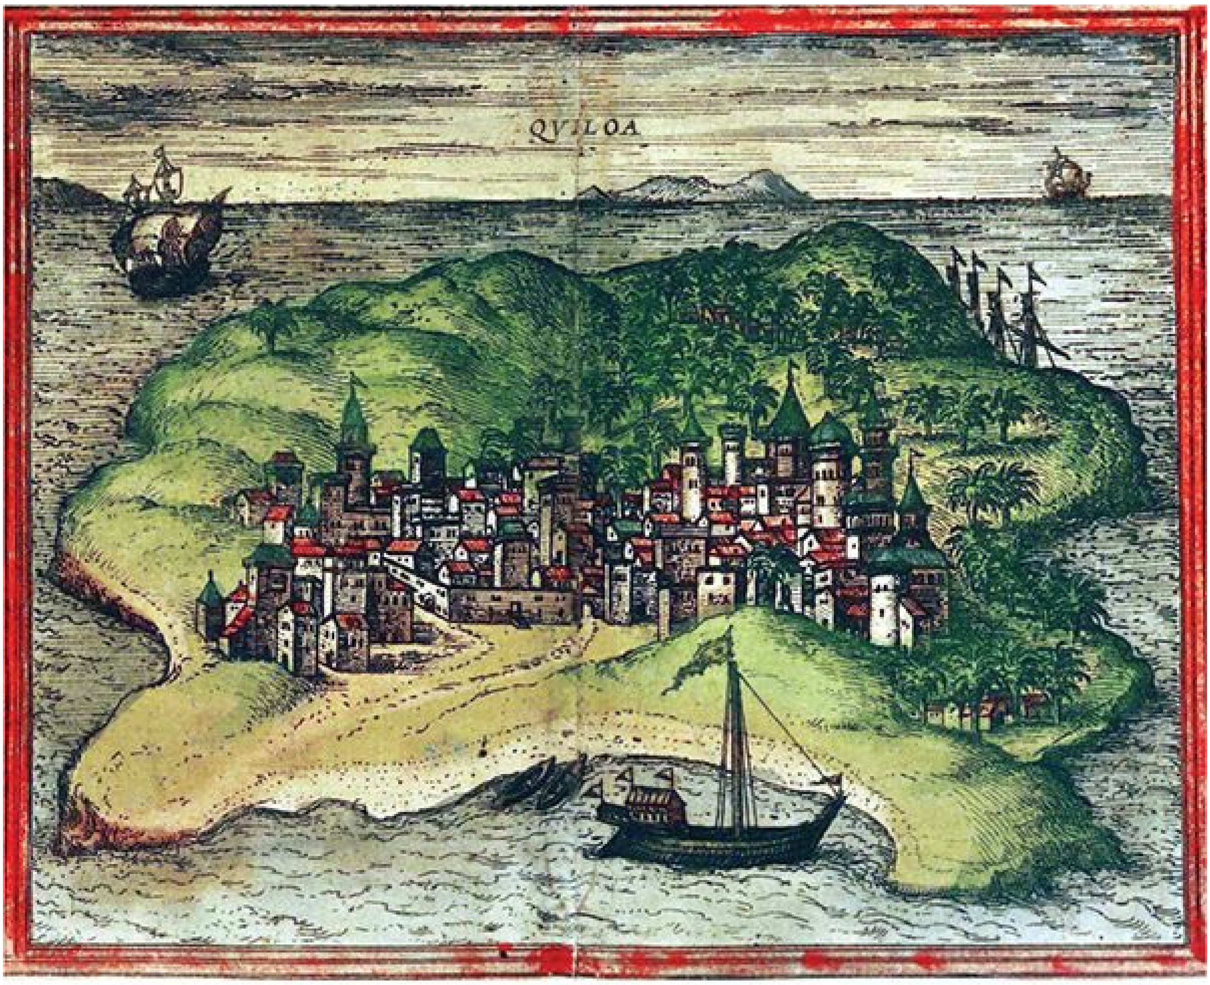
In contrast to most parts of the world other than Africa, Southeast

Asian peoples had an accepting attitude toward premarital sexual activity and placed no premium on virginity at marriage. Divorce carried no social stigma and was easily attainable if a pair proved incompatible. Either the woman or the man could initiate a divorce.

Trade with Africa and the Middle East

On the east coast of Africa, Swahili-speaking city-states engaged in the Indian Ocean trade, exchanging ivory, rhinoceros horn, tortoise shells, copra (dried coconut), and slaves for textiles, spices, cowrie shells, porcelain, and other goods. The most important cities were Mogadishu, Mombasa, and Kilwa, which had converted to Islam by the eleventh century.

West Africa also played an important role in world trade. In the fifteenth century most of the gold that reached Europe came from the Sudan region in West Africa. Transported across the Sahara by Arab and African traders on camels, the gold was sold in the ports of North Africa. Other trading routes led to the Egyptian cities of Alexandria and Cairo.



Pictures from History/Bridgeman Images

Island of Kilwa The small island of Kilwa, off the coast of modern-day Tanzania, was a vital center of Indian Ocean trade from the thirteenth to the fifteenth centuries. During this period, the sultanate of Kilwa controlled trade among the Swahili-speaking cities of the east coast of Africa; its merchants dealt in gold, silver, pearls, and porcelain. The arrival of the Portuguese in 1498 led to the loss of Kilwa's autonomy.

Inland nations that sat astride the north-south caravan routes grew wealthy from this trade. In the mid-thirteenth century the kingdom of Mali emerged as an important player on the overland trade route. In later centuries, however, the diversion of gold away from the trans-Sahara routes would weaken the inland states of Africa politically and economically.

Gold was one important object of trade; slaves were another. Long before the arrival of Europeans, Arab and African merchants took West African slaves to the Mediterranean to be sold in European, Egyptian, and Middle Eastern markets and also brought eastern Europeans to West Africa as slaves. In addition, Indian and Arab merchants traded slaves in the coastal regions of East Africa.

The Middle East served as an intermediary for trade between Europe, Africa, and Asia and was also an important supplier of goods for foreign exchange. Two great rival empires, the Persian Safavids and the Turkish Ottomans, dominated the region, competing for control over western trade routes to the East. By the mid-sixteenth century the Ottomans had established control over eastern Mediterranean sea routes to trading centers in Syria, Palestine, Egypt, and the rest of North Africa (see "The Expansion of the Ottoman Empire" in Chapter 17). Their power extended into Europe as far west as Vienna.

Mansa Musa This detail from the Catalan Atlas of 1375, a world map created for the Catalan king, depicts a king of Mali, Mansa Musa, who was legendary for his wealth in gold. European desires for direct access to the trade in sub-Saharan gold helped inspire Portuguese exploration of the west coast of Africa in the fifteenth century.

Genoese and Venetian Middlemen

Europe constituted a minor outpost in the world trading system, for European craftsmen produced few products to rival those of Asia. However, Europeans desired luxury goods from the East, and in the late Middle Ages such trade was controlled by the Italian city-states of Venice and Genoa. Venice had opened the gateway to Asian trade in 1304, when it established formal relations with the sultan of Mamluk Egypt and started operations in Cairo. Because demand for European goods was low, Venetians funded their purchases through shipping and trade in firearms and slaves.

Venice's ancient trading rival was Genoa. By 1270 Genoa dominated the northern route to Asia through the Black Sea. From then until the fourteenth century the Genoese expanded their trade routes as far as Persia and the Far East.

In the fifteenth century, with Venice claiming victory in the spice trade, the Genoese shifted focus from trade to finance and from the Black Sea to the western Mediterranean. When Spanish and Portuguese voyages began to explore the western Atlantic (see "The European Voyages of Discovery"), Genoese merchants, navigators, and financiers provided their skills and capital to the Iberian monarchs.

A major element of Italian trade was slavery. Merchants purchased slaves in the Balkans of southeastern Europe. After the loss of the Black Sea trade routes — and thus the source of slaves — to the Ottomans, the Genoese sought new supplies of slaves in the West, eventually seizing or buying and selling the Guanches (indigenous peoples from the Canary Islands), Muslim prisoners and Jewish refugees from Spain, and, by the early 1500s, both black and Berber Africans. With the growth of Spanish colonies in the New World, Genoese and Venetian merchants became important players in the Atlantic slave trade.

The European Voyages of Discovery

How and why did Europeans undertake ambitious voyages of expansion?

As Europe recovered after the Black Death, new European players entered the scene with novel technology, eager to spread Christianity and to undo Italian and Ottoman domination of trade with the East. A century after the plague, Iberian explorers began overseas voyages that helped create the modern world, with immense consequences for their own continent and the rest of the planet.

Causes of European Expansion

European expansion had multiple causes. The first was economic. By the middle of the fifteenth century Europe was experiencing a revival of population and economic activity after the lows of the Black Death. This revival created renewed demand for luxuries, especially spices, from the East. Introduced into western Europe by the Crusaders in the twelfth century, spices such as pepper, nutmeg, cinnamon, and cloves added flavor and variety to the monotonous European diet. They were also used in anointing oil and as incense for religious rituals, and as perfumes, medicines, and dyes in daily life. The fall of Constantinople and the subsequent Ottoman control of trade routes created obstacles to fulfilling demands for these precious and prestigious goods. Europeans eager for the profits of trade thus needed to find new sources of precious metal to exchange with the Ottomans or trade routes that bypassed the Ottomans.

Religious fervor and the crusading spirit were the second important catalyst for expansion. Just seven months separated Isabella and Ferdinand’s conquest of the emirate of Granada, the last remaining Muslim state on the Iberian Peninsula, and Columbus’s departure across the Atlantic. Overseas exploration thus transferred the militaristic religious fervor of the reconquista (reconquest) to new non-Christian territories. As they conquered indigenous empires, Iberians brought the attitudes and administrative practices developed during the reconquista to the Americas.

A third motivation was the dynamic spirit of the Renaissance. Like other men of the Renaissance era, explorers sought to win glory for their exploits and demonstrated a genuine interest in learning more about unknown waters. The detailed journals kept by European voyagers attest to their fascination with the new peoples and places they visited.

The people who stayed at home had a powerful impact on the voyages of discovery. Merchants provided the capital for many early voyages and had a strong say in their course. To gain authorization and financial support for their expeditions, they sought official sponsorship from the Crown. Competition among European monarchs for the prestige and profit of overseas exploration thus constituted another crucial factor in encouraging the steady stream of expeditions that began in the late fifteenth century.

The small number of Europeans who could read provided a rapt audience for tales of fantastic places and unknown peoples. Cosmography, natural history, and geography aroused enormous interest among educated people in the fifteenth and sixteenth centuries. One of the most popular books of the time was the fourteenth-century text *The Travels of Sir John Mandeville*, which purported to be a firsthand account of the author's travels in the Middle East, India, and China.

Technology and the Rise of Exploration

The Iberian powers sought technological improvements in shipbuilding, weaponry, and navigation in order to undertake ambitious voyages of exploration and trade. Medieval European seagoing vessels consisted of open galleys propelled by oars, common in Mediterranean trade, or single-masted sailing ships. Though adequate for short journeys that hugged the shoreline, such vessels were incapable of long-distance journeys or high-volume trade. In the fifteenth century the Portuguese developed the **caravel**, a three-masted sailing ship. Its multiple sails and sternpost rudder made the caravel a more maneuverable vessel that required fewer crewmen to operate. It could carry more cargo than a galley, which meant it could sail farther without stopping for supplies and return with a larger cache of profitable goods. When fitted with cannon, it could dominate larger vessels and bombard port cities.

This period also saw great strides in cartography and navigational aids. Around 1410 a Latin translation reintroduced western Europeans to **Ptolemy's *Geography***. Written in the second century, the work synthesized the geographical knowledge of the classical world. It represented a major improvement over medieval cartography by depicting the world as round and introducing latitude and longitude markings, but it also contained significant errors. Unaware of the Americas, Ptolemy showed the world as much smaller than it is, so that Asia appeared not very far to the west of Europe.

The Portuguese Fleet Embarked for the Indies This image shows a Portuguese trading fleet in the late fifteenth century bound for the riches of the Indies. Between 1500 and 1635 over nine hundred ships sailed from Portugal to ports on the Indian Ocean in annual fleets composed of five to ten ships. Portuguese sailors used astrolabes, such as the one pictured here, to accurately plot their position.

Originating in China, the magnetic compass was brought to the West in the late Middle Ages. By using the compass to determine their direction and estimating their speed of travel over a set length of time, mariners could determine the course of a ship’s voyage. The astrolabe, an instrument invented by the ancient Greeks and perfected by Muslim navigators, was used to determine the altitude of the sun and other celestial bodies. It allowed mariners to plot their latitude, that is, their precise position north or south of the equator.

Much of the new technology that Europeans used on their voyages was borrowed from the East. Gunpowder, the compass, and the sternpost rudder were Chinese inventions. The triangular lateen sail, which allowed caravels to tack against the wind, was a product of the Indian Ocean trade world. Advances in cartography and navigation also drew on the rich tradition of Judeo-Arabic mathematical and astronomical learning in Iberia. In exploring new territories, European sailors thus called on techniques and knowledge developed over centuries in China, the Muslim world, and trading centers along the Indian Ocean.

The Portuguese in Africa and Asia

For centuries Portugal was a small and poor nation on the margins of European life whose principal activities were fishing and subsistence farming. Yet Portugal had a long history of seafaring and navigation. Nature favored the Portuguese: winds blowing along their coast offered passage to Africa, its Atlantic islands, and, ultimately, Brazil. Once they had mastered the secret to sailing against the wind to return to Europe (by sailing farther west to catch winds from the southwest), they were poised to lead Atlantic exploration. The objectives of Portuguese exploration included achieving military glory; converting Muslims; and finding gold, slaves, and an overseas route to Asian spice markets.

In the early phases of Portuguese exploration, Prince Henry (1394–1460), a younger son of the king, played a leading role. A nineteenth-century scholar dubbed Henry “the Navigator” because of his support for Portuguese voyages of discovery. Henry participated in Portugal’s conquest of Ceuta (sa-OO-tah), an Arab city in northern Morocco, in 1415, an event that marked the beginning of European overseas expansion. In the 1420s, under Henry’s direction, the Portuguese began to settle the Atlantic islands of Madeira (ca. 1420) and the Azores (1427). In 1443 they founded their first African commercial settlement at Arguin in North Africa. By the time of Henry’s death in 1460, his support for exploration had resulted in thriving sugar plantations on the Atlantic islands, the first arrival of enslaved Africans in Portugal, and new access to African gold.

The Portuguese next established fortified trading posts, called factories, on the gold-rich Guinea coast and penetrated into the African continent all the way to Timbuktu (Map 16.2). By 1500 Portugal controlled the flow of African gold to Europe. In contrast to the Spanish who conquered the Americas (see “Spanish Conquest of the Aztec and Inca Empires”), the Portuguese did not establish large settlements in West Africa or seek to control the political or cultural lives of those with whom they traded. Instead they sought to profit by inserting themselves into existing trading systems. For the first century of their relations, African rulers were equal partners with the Portuguese, benefiting from their experienced armies and European vulnerability to tropical diseases.

Mapping the Past

MAP 16.2 Overseas Exploration and Conquest in the Fifteenth and Sixteenth Centuries The voyages of discovery marked a dramatic new phase in the centuries-old migrations of European peoples. This map depicts the voyages of the most significant European explorers of the period.

ANALYZING THE MAP Consider the routes and dates of the voyages shown. How might the successes of the earlier voyages have contributed to the later expeditions? Which voyage had the most impact, and why?

CONNECTIONS Do you think the importance of these voyages was primarily economic, political, or cultural? Why?

In 1487 Bartholomew Diaz (ca. 1451–1500) rounded the Cape of Good Hope at the southern tip of Africa (see Map 16.2), but poor conditions forced him to turn back. A decade later Vasco da Gama (ca. 1469–1524) succeeded in rounding the Cape while commanding a fleet in search of a sea route to India. With the help of an Indian guide, da Gama reached the port of Calicut in India. He returned to Lisbon with spices and samples of

Indian cloth, having proved the possibility of lucrative trade with the East via the Cape route. Thereafter, a Portuguese convoy set out for passage around the Cape every March.

Lisbon became the entrance port for Asian goods into Europe, but this was not accomplished without a fight. Muslim-controlled port city-states had long controlled the rich trade of the Indian Ocean, and they did not surrender it willingly. From 1500 to 1515 the Portuguese used a combination of bombardment and diplomatic treaties to establish trading factories at Goa, Malacca, Calicut, and Hormuz, thereby laying the foundation for a Portuguese trading empire. The acquisition of port cities and their trade routes brought riches to Portugal, but, as in Africa, the Portuguese had limited impact on the lives and religious faith of peoples beyond Portuguese coastal holdings.

Inspired by the Portuguese, the Spanish had also begun the quest for empire. Theirs was to be a second, entirely different mode of colonization, leading to the conquest of existing empires, large-scale settlement, and the forced assimilation of huge indigenous populations.

Spain’s Voyages to the Americas

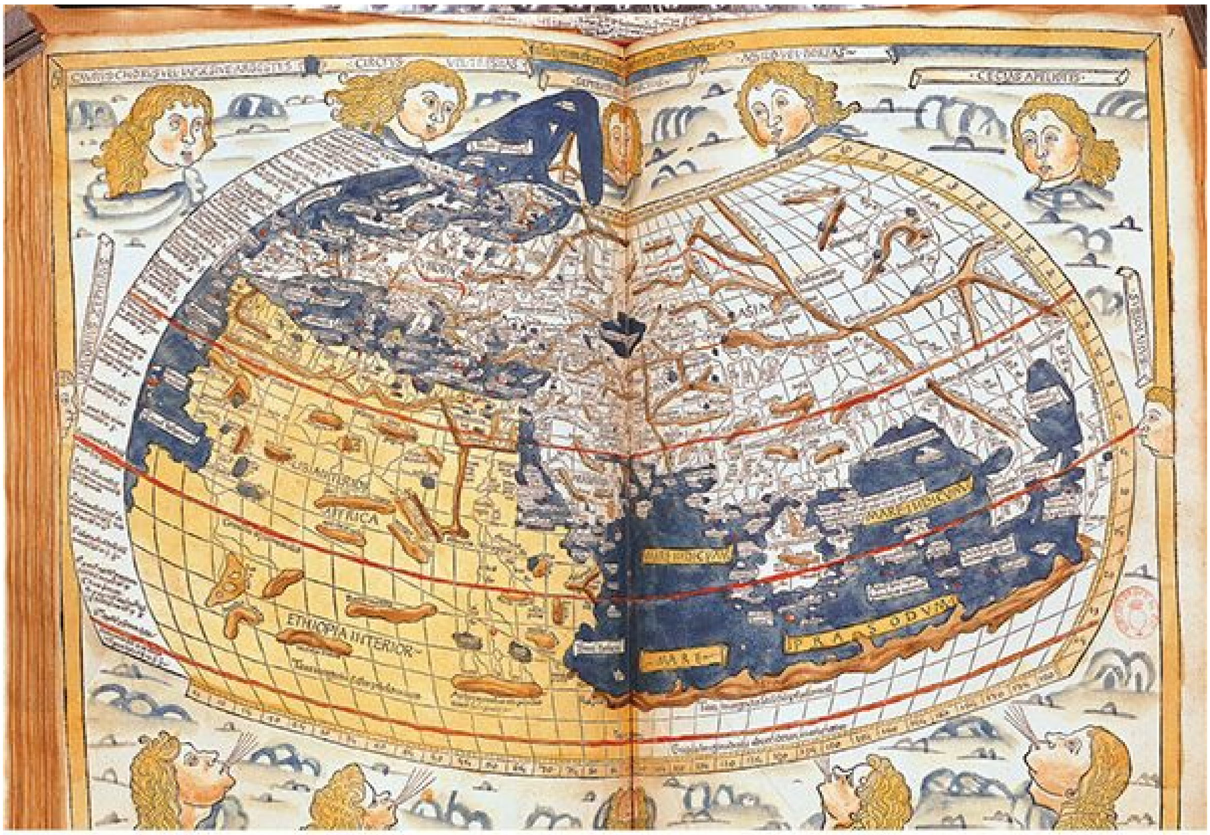
Christopher Columbus was not the first to cross the Atlantic. Ninth-century Vikings established short-lived settlements in Newfoundland, and it is probable that others made the voyage, either on purpose or accidentally, carried by westward currents off the coast of Africa. In the late fifteenth century the achievements of Portugal’s decades of exploration made the moment right for Christopher Columbus’s attempt to find a westward route across the Atlantic to Asia.

Christopher Columbus, a native of Genoa, was an experienced seaman and navigator. He had worked as a mapmaker in Lisbon and had spent time on Madeira. He was familiar with such fifteenth-century Portuguese navigational aids as *portolans* — written descriptions of the courses along which ships sailed — and the use of the compass as a navigational instrument.

Columbus was also a deeply religious man. He had witnessed the Spanish conquest of Granada and shared fully in the religious fervor surrounding that event. Like the Spanish rulers and most Europeans of his age, Columbus understood Christianity as a missionary religion that should be carried to all places of the earth.

Rejected for funding by the Portuguese in 1483 and by Ferdinand and Isabella in 1486, Columbus finally won the support of the Spanish monarchy in 1492. Buoyed by the success of the reconquista and eager to earn profits from trade, the Spanish crown agreed to make him viceroy over any territory he might discover and to give him one-tenth of the material rewards of the journey.

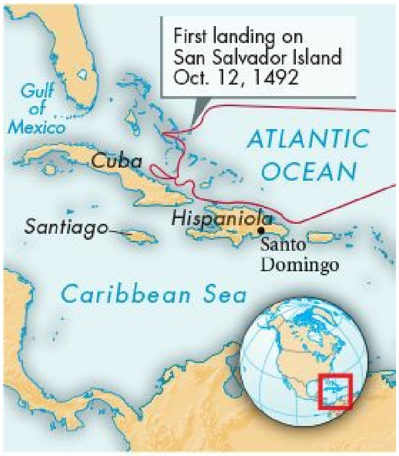
Columbus and his small fleet left Spain on August 3, 1492. Columbus dreamed of reaching the court of the Mongol emperor, the Great Khan, not realizing that the Ming Dynasty had overthrown the Mongols in 1368. Based on Ptolemy's *Geography* and other texts, he expected to pass the islands of Japan and then land on the east coast of China.



Bibliothèque Nationale, Paris, France/Bridgeman Images

Ptolemy's *Geography* The recovery of Ptolemy's *Geography* in the early fifteenth century gave Europeans new access to ancient geographical knowledge. This 1486 world map is a great advance over medieval maps but contains errors with significant consequences for future exploration. It shows a single continent watered by a single ocean, with land covering three-quarters of the world's surface. Africa and Asia are joined with Europe, making the Indian Ocean a landlocked sea and rendering the circumnavigation of Africa impossible. Australia and the Americas are nonexistent, and the continent of Asia is stretched far to the east, greatly shortening the distance from Europe to Asia via the Atlantic.

On October 12 Columbus landed in the Bahamas, which he christened San Salvador and claimed for the Spanish crown. In a letter he wrote to Ferdinand and Isabella on his return to Spain, Columbus described the natives as handsome, peaceful, and primitive. Believing he was somewhere off the east coast of Japan, in what he considered the Indies, he called them "Indians," a name that was later applied to all inhabitants of the Americas. Columbus concluded that they would make good slaves and could quickly be converted to Christianity. (See “Analyzing the Evidence: Columbus Describes His First Voyage,” above.)



Wiesner-Hanks et al., *A History of World Societies*, 11e, © 2018 Bedford/St. Martin’s

Columbus’s First Voyage to the New World, 1492–1493

Scholars have identified the inhabitants of the islands as the Taino (TIGH-noh) people. From San Salvador, Columbus sailed southwest, landing on Cuba on October 28. Deciding that he must be on the mainland of China near the coastal city of Quinsay (now Hangzhou), he sent a small embassy inland with letters from Ferdinand and Isabella and instructions to locate the city. Although they found no large settlement, the sight of Taino people wearing gold ornaments on Hispaniola suggested that gold was available in the region. In January, confident that its source would soon be found, he headed back to Spain to report on his discovery.

On his second voyage, Columbus took control of the island of Hispaniola and enslaved its indigenous peoples. On this and subsequent voyages, he brought with him settlers for the new Spanish territories, along with agricultural seed and livestock. Columbus himself, however, had limited skills in governing. Revolt soon broke out against him and his brother on Hispaniola. A royal expedition sent to investigate returned the brothers to Spain in chains, and a royal governor assumed control of the colony.

ANALYZING THE EVIDENCE

Columbus Describes His First Voyage

On his return voyage to Spain in February 1493, Christopher Columbus composed a letter intended for wide circulation and had copies of it sent ahead to Isabella, Ferdinand, and others when his ship docked at Lisbon. Because the letter sums up Columbus's understanding of his achievements, it is considered the most important document of his first voyage.

▩ Since I know that you will be pleased at the great success with which the Lord has crowned my voyage, I write to inform you how in thirty-three days I crossed from the Canary Islands to the Indies, with the fleet which our most illustrious sovereigns gave me. I found very many islands with large populations and took possession of them all for their Highnesses; this I did by proclamation and unfurled the royal standard. No opposition was offered.

I named the first island that I found "San Salvador," in honour of our Lord and Saviour who has granted me this miracle.… When I reached Cuba, I followed its north coast westwards, and found it so extensive that I thought this must be the mainland, the province of Cathay.[*] … From there I saw another island eighteen leagues eastwards which I then named "Hispaniola."[†] …

Hispaniola is a wonder. The mountains and hills, the plains and meadow lands are both fertile and beautiful. They are most suitable for planting crops and for raising cattle of all kinds, and there are good sites for building towns and villages. The harbours are incredibly fine and there are many great rivers with broad channels and the majority contain gold.[‡] The trees, fruits and plants are very different from those of Cuba. In Hispaniola there are many spices and large mines of gold and other metals.[§] …

The inhabitants of this island, and all the rest that I discovered or heard of, go naked, as their mothers bore them, men and women alike. A few of the women, however, cover a single place with a leaf of a plant or piece of cotton which they weave for the purpose. They have no iron or steel or arms and are not capable of using them, not because they are not strong and well built but because they are amazingly timid. All the weapons they have are canes cut at seeding time, at the end of which they fix a sharpened stick, but they have not the courage to make use of these, for very often when I have sent two or three men to a village to have conversation with them a great number of them have come out. But as soon as they saw my men all fled immediately, a father not even waiting for his son. And this is not because we have harmed any of them; on the contrary, wherever I have gone and been able to have conversation with them, I have given them some of the various things I had, a cloth and other articles, and received nothing in exchange. But they have still remained incurably timid. True, when they have been reassured and lost their fear, they are so ingenuous and so liberal with all their possessions that no one who has not seen them would believe it. If one asks for anything they have they never say no. On the contrary, they offer a share to anyone with demonstrations of heartfelt affection, and they are immediately content with any small thing, valuable or valueless, that is given them. I forbade the men to give them bits of broken crockery, fragments of glass or tags of laces, though if they could get them they fancied them the finest jewels in the world.

I hoped to win them to the love and service of their Highnesses and of the whole Spanish nation and to persuade them to collect and give us of the things which they possessed in abundance and which we needed. They have no religion and are not idolaters; but all believe that power and goodness dwell in the sky and they are firmly convinced that I have come from the sky with these ships and people. In this belief they gave me a good reception everywhere, once they had overcome their fear; and this is not because they are stupid — far from it, they are men of great intelligence, for they navigate all those seas, and give a marvellously good account of everything — but because they have never before seen men clothed or ships like these….

In all these islands the men are seemingly content with one woman, but their chief or king is allowed more than twenty. The women appear to work more than the men and I have not been able to find out if they have private property. As far as I could see whatever a man had was shared among all the rest and this particularly applies to food…. In another island, which I am told is larger than Hispaniola, the people have no hair. Here there is a vast quantity of gold, and from here and the other islands I bring Indians as evidence.

In conclusion, to speak only of the results of this very hasty voyage, their Highnesses can see that I will give them as much gold as they require, if they will render me some very slight assistance; also I will give them all the spices and cotton they want…. I will also bring them as much aloes as they ask and as many slaves, who will be taken from the idolaters. I believe also that I have found rhubarb and cinnamon and there will be countless other things in addition….

So all Christendom will be delighted that our Redeemer has given victory to our most illustrious King and Queen and their renowned kingdoms, in this great matter. They should hold great celebrations and render solemn thanks to the Holy Trinity with many solemn prayers, for the great triumph which they will have, by the conversion of so many peoples to our holy faith and for the temporal benefits which will follow, for not only Spain, but all Christendom will receive encouragement and profit.

This is a brief account of the facts.

QUESTIONS FOR ANALYSIS

1. How did Columbus explain the success of his voyage?
2. What was Columbus's view of the Native Americans he met?
3. Evaluate Columbus's statements that the Caribbean islands possessed gold, cotton, and spices.
4. Why did Columbus cling to the idea that he had reached Asia?

[*] Cathay is the old name for China. In the logbook and later in this letter Columbus accepts the natives' story that Cuba is an island that they can circumnavigate in something more than twenty-one days, yet he insists here and during the second voyage that it is in fact part of the Asiatic mainland.

[†] Hispaniola is the second-largest island of the West Indies; Haiti occupies the western third of the island, the Dominican Republic the rest.

[‡] This did not prove to be true.

[§] These statements are also inaccurate.

[**] Actually, Columbus was off Santa Maria in the Azores.

Spain “Discovers” the Pacific

Columbus never realized the scope of his achievement: that he had found a vast continent unknown to Europeans, except for the fleeting Viking presence centuries earlier. The Florentine navigator Amerigo Vespucci (veh-SPOO-chee) (1454–1512) realized what Columbus had not. Writing about his discoveries on the coast of modern-day Venezuela, Vespucci stated: “Those new regions which we found and explored with the fleet … we may rightly call a New World.” This letter was the first document to describe America as a continent separate from Asia. In recognition of Amerigo’s bold claim, the continent was named for him.

To settle competing claims to the Atlantic discoveries, Spain and Portugal turned to Pope Alexander VI. The resulting **Treaty of Tordesillas** (tawr-duh-SEE-yuhs) in 1494 gave Spain everything to the west of an imaginary line drawn down the Atlantic and Portugal everything to the east.

Treaty of Tordesillas The 1494 agreement giving Spain everything west of an imaginary line drawn down the Atlantic and giving Portugal everything to the east.

The search for profits determined the direction of Spanish exploration. Because its profits from Hispaniola and other Caribbean islands were insignificant compared to Portugal’s enormous riches from the Asian spice trade, Spain renewed the search for a western passage to Asia. In 1519 Charles I of Spain (who was also Holy Roman emperor Charles V) commissioned Ferdinand Magellan (1480–1521) to find a direct sea route to Asia. Magellan sailed southwest across the Atlantic to Brazil, and after a long search along the coast he located the strait off the southern tip of South America that now bears his name (see Map 16.2). After passing through the strait into the Pacific Ocean in 1520, his fleet sailed north up the west coast of South America and then headed west into the Pacific.

Terrible storms, disease, starvation, and violence devastated the expedition. Magellan himself was killed in a skirmish in the Malay Archipelago, and only one of the five ships that began the expedition made it back to Spain. This ship returned home in 1522 with only eighteen men aboard, having traveled from the east by way of the Indian Ocean, the Cape of Good Hope, and the Atlantic. The voyage — the first to circumnavigate the globe — had taken close to three years.

Despite the losses, this voyage revolutionized Europeans' understanding of the world by demonstrating the vastness of the Pacific. The earth was clearly much larger than Ptolemy's map had shown. Magellan's expedition also forced Spain's rulers to rethink their plans for overseas commerce and territorial expansion. The westward passage to the Indies was too long and dangerous for commercial purposes. Thus Spain soon abandoned the attempt to oust Portugal from the Eastern spice trade and concentrated on exploiting its New World territories.

Early Exploration by Northern European Powers

Spain's northern European rivals also set sail across the Atlantic during the early days of exploration, searching for a northwest passage to the Indies. In 1497 John Cabot (ca. 1450–1499), a Genoese merchant living in London, landed on Newfoundland. The next year he returned and explored the New England coast. These forays proved futile, and at that time the English established no permanent colonies in the territories they explored.

News of the riches of Mexico and Peru later inspired the English to renew their efforts, this time in the extreme north. Between 1576 and 1578 Martin Frobisher (ca. 1535–1594) made three voyages in and around the Canadian bay that now bears his name. Frobisher brought a quantity of ore back to England, but it proved to be worthless.

Early French exploration of the Atlantic was equally frustrating. Between 1534 and 1541 Frenchman Jacques Cartier (1491–1557) made several voyages and explored the St. Lawrence River of Canada, searching for a passage to the wealth of Asia. When this hope proved vain, the French turned to a new source of profit within Canada itself: trade in beavers and other furs. As had the Portuguese in Asia, French traders bartered with local peoples whom they largely treated as autonomous and equal partners. French fishermen also competed with the Spanish and English for the schools of cod they found in the Atlantic waters around Newfoundland.

Conquest and Settlement

What was the impact of Iberian conquest and settlement on the peoples and ecologies of the Americas?

Before Columbus's arrival, the Americas were inhabited by thousands of groups of indigenous peoples with distinct languages and cultures. These groups ranged from hunter-gatherer tribes organized into tribal confederations to settled agriculturalists to large-scale empires containing bustling cities and towns. The best estimate is that the peoples of the Americas numbered between 50 and 60 million in 1492. These numbers were decimated, and the lives of survivors radically altered, by the arrival of Europeans.

Spanish Conquest of the Aztec and Inca Empires

The first two decades after Columbus's arrival in the New World saw Spanish settlement of Hispaniola, Cuba, Puerto Rico, and other Caribbean islands. Based on rumors of a wealthy mainland civilization, the Spanish governor in Cuba sponsored expeditions to the Yucatán coast of the Gulf of Mexico, including one in 1519 under the command of the **conquistador** (kahn-KEES-tuh-dawr) Hernán Cortés (1485–1547). *Conquistador* was Spanish for "conqueror," a Spanish soldier-explorer who sought to conquer the New World for the Spanish crown. Alarmed by Cortés's ambition, the governor withdrew his support, but Cortés quickly set sail before being removed from command. Cortés and his party landed on the Mexican coast on April 21, 1519. His camp soon received visits by delegations of Aztec leaders bearing gifts and news of their great emperor.

The **Aztec Empire**, an alliance between the Mexica people and their conquered allies, had risen rapidly in size and power over the fifteenth century. At the time of the Spanish arrival, the empire was ruled by Moctezuma II (r. 1502–1520), from his capital at Tenochtitlan (tay-nawch-TEET-lahn), now Mexico City. The Aztecs were a sophisticated society and culture, with advanced mathematics, astronomy, and engineering. As in European nations at the time, a hereditary nobility dominated the army, the priesthood, and the state bureaucracy and reaped the gains from the agricultural labor of the common people.

The Aztec Capital of Tenochtitlan This woodcut map was published in 1524 along with Cortés's letters describing the conquest of the Aztecs. As it shows, Tenochtitlan occupied an island and was laid out in concentric circles. The administrative and religious buildings were at the heart of the city, which was surrounded by residential quarters. Cortés himself marveled at the city in his letters: "The city is as large as Seville or Cordoba…. There are bridges, very large, strong, and well constructed, so that, over many, ten horsemen can ride abreast…. The city has many squares where markets are held…. There is one square … where there are daily more than sixty thousand souls, buying and selling. In the service and manners of its people, their fashion of living was almost the same as in Spain, with just as much harmony and order."

Within weeks of his arrival, Cortés acquired translators who provided vital information on the empire and its weaknesses. (See "Thinking Like a Historian: Who Was Doña Marina?" page 452.) Through his interpreters, Cortés learned of strong local resentment against the Aztec Empire. The

Aztec state practiced brutal warfare against neighboring peoples to secure captives for religious sacrifices and laborers for agricultural and building projects. Once conquered, subject tribes paid continual tribute to the empire through their local chiefs. Realizing that he could exploit dissensions within the empire to his own advantage, Cortés forged an alliance with Tlaxcala (tlah-SKAH-lah), a subject kingdom of the Aztecs. In October a combined Spanish-Tlaxcalan force occupied the Aztec city of Cholula, the second largest in the empire, and massacred thousands of inhabitants. Strengthened by this victory, Cortés formed alliances with other native kingdoms. In November 1519, with a few hundred Spanish men and some six thousand indigenous warriors, he marched on Tenochtitlan.

Unlike other native leaders, Moctezuma refrained from attacking the Spaniards and instead welcomed Cortés and his men into Tenochtitlan. Moctezuma was apparently deeply impressed by Spanish victories and believed the Spanish were invincible. When Cortés took Moctezuma hostage, the emperor's influence crumbled. During the ensuing attacks and counterattacks, Moctezuma was killed. The Spaniards and their allies escaped from the city suffering heavy losses. Cortés quickly began gathering forces and making new alliances against the Aztecs. In May 1521 he led a second assault on Tenochtitlan, leading an army of approximately one thousand Spanish and seventy-five thousand native warriors.[1]

Invasion of Tenochtitlan, 1519–1521

The Spanish victory in late summer 1521 was hard-won and was greatly aided by the effects of smallpox, which had devastated the besieged population of the city. After establishing a new capital in the ruins of Tenochtitlan, Cortés and other conquistadors began the systematic conquest of Mexico, a decades-long and brutal process.

More remarkable than the defeat of the Aztecs was the fall of the remote **Inca Empire** in Peru. Living in a settlement perched more than 9,800 feet above sea level, the Incas were isolated from the Mesoamerican civilization of the Aztecs. Like the Mexica, the Incas had created a polity that rivaled that of the Europeans in population and complexity and that had reached its height in the fifteenth century. The Incas’ strength lay largely in their bureaucratic efficiency. Ruled from the capital city of Cuzco, the empire was divided into four major regions, each region into provinces, and each province into districts. Officials at each level used the extensive network of roads to transmit information and orders. While the Aztecs used a system of glyphs for writing, the Incas had devised a complex system of colored and knotted cords, called khipus, for administrative bookkeeping.

Inca Women Milking Cows This illustration of Inca women milking cows is from a collection of illustrations by a Spanish bishop that offers a valuable view of life in Peru in the 1780s.

By the time of the Spanish invasion, however, the Inca Empire had been weakened by a civil war over succession and an epidemic of disease, probably smallpox, spread through trade with groups in contact with Europeans. The Spanish conquistador Francisco Pizarro (ca. 1475–1541) landed on the northern coast of Peru on May 13, 1532, the very day the Inca leader Atahualpa (ah-tuh-WAHL-puh) won control of the empire. As Pizarro advanced across the Andes toward Cuzco (KOOS-ko), the capital of the Inca Empire, Atahualpa was also heading there for his coronation.

Like Moctezuma in Mexico, Atahualpa sent envoys to greet the Spanish. Motivated by curiosity about the Spanish, he intended to meet with them to learn more about them and their intentions. Instead the Spaniards ambushed and captured him, extorted an enormous ransom in gold, and then executed him on trumped-up charges in 1533. The Spanish then marched on to Cuzco, profiting, as with the Aztecs, from internal conflicts and forming alliances with local peoples. When Cuzco fell in 1533, the Spanish plundered immense riches in gold and silver.

The Conquest of Peru, 1532–1533

How was it possible for several hundred Spanish conquistadors to defeat powerful empires commanding large armies, vast wealth, and millions of inhabitants? Historians seeking answers to this question have emphasized a combination of factors: the military superiority provided by Spanish gunpowder, steel swords, and horses; divisions within the Aztec and Inca Empires, which produced many native allies and interpreters for the Spanish; and, most important, the devastating impact of contagious diseases among the indigenous population. Ironically, the well-organized, urban-based Aztec and Inca Empires were more vulnerable to wholesale takeover than were more decentralized and fragmented groups like the Maya in the Yucatán peninsula, whose independence was not wholly crushed until the end of the seventeenth century.

THINKING LIKE A HISTORIAN

Who Was Doña Marina?

In April 1519 Doña Marina was among twenty women given to the Spanish as slaves. Fluent in Nahuatl and Yucatec Maya (spoken by a Spanish priest accompanying Cortés), she acted as an interpreter and diplomatic guide for the Spanish. She had a close relationship with Cortés and bore his son, Don Martín Cortés, in 1522. Although no writings by Doña Marina survive, she figures prominently in both Spanish and indigenous sources on the conquest.

1 **Cortés's letter to Charles I, 1522.** This letter to Charles I contains one of only two written references to Doña Marina found in Cortés's correspondence with the king. He describes her as his "interpreter."

■ During the three days I remained in that city they fed us worse each day, and the lords and principal persons of the city came only rarely to see and speak with me. And being somewhat disturbed by this, my interpreter, who is an Indian woman from Putunchan, which is the great river of which I spoke to Your Majesty in the first letter, was told by another Indian woman and a native of this city that very close by many of Mutezuma's men were gathered, and that the people of the city had sent away their women and children and all their belongings, and were about to fall on us and kill us all; and that if she wished to escape she should go with her and she would shelter her. All this she told to Gerónimo de Aguilar, an interpreter whom I acquired in Yucatán, of whom I have also written to Your Highness; and he informed me.

2 **Díaz's account of the conquest of the Aztecs.** Bernal Díaz del Castillo participated in the conquest of the Aztecs alongside Cortés. His historical account of the conquest, written much later in life, provides the lengthiest descriptions of Doña Marina.

■ Early the next morning many Caciques and chiefs of Tabasco and the neighbouring towns arrived and paid great respect to us all, and they brought a present of gold, … and some other things of little value…. This present, however, was worth nothing in comparison with the twenty women that were given us, among them one very excellent woman called Doña Marina, for so she was named when she became a Christian.

… Cortés allotted one of the women to each of his captains and Doña Marina, as she was good looking and intelligent and without embarrassment, he gave to Alonzo Hernández Puertocarrero. When Puertocarrero went to Spain, Doña Marina lived with Cortés, and bore him a son named Don Martin Cortés.

… Her father and mother were chiefs and Caciques of a town called Paynala…. Her father died while she was still a little child, and her mother married another Cacique, a young man, and bore him a son. It seems that the father and mother had a great affection for this son and it was agreed between them that he should succeed to their honours when their days were done. So that there should be no impediment to this, they gave the little girl, Doña Marina, to some Indians from Xicalango, and this they did by night so as to escape observation, and they then spread the report that she had died, and as it happened at this time that a child of one of their Indian slaves died they gave out that it was their daughter and the heiress who was dead.

The Indians of Xicalango gave the child to the people of Tabasco and the Tabasco people gave her to Cortés.

… As Doña Marina proved herself such an excellent woman and good interpreter throughout the wars in New Spain, Tlaxcala and Mexico (as I shall show later on) Cortés always took her with him, and during that expedition she was married to a gentleman named Juan Jaramillo at the town of Orizaba.

Doña Marina was a person of the greatest importance and was obeyed without question by the Indians throughout New Spain.

Marina … said that God had been very gracious to her in freeing her from the worship of idols and making her a Christian, and letting her bear a son to her lord and master Cortés and in marrying her to such a gentleman as Juan Jaramillo, who was now her husband. That she would rather serve her husband and Cortés than anything else in the world, and would not exchange her place to be Cacica of all the provinces in New Spain.

Doña Marina knew the language of Coatzacoalcos, which is that common to Mexico, and she knew the language of Tabasco, as did also Jerónimo de Aguilar, who spoke the language of Yucatan and Tabasco, which is one and the same. So that these two could understand one another clearly, and Aguilar translated into Castilian for Cortés.

This was the great beginning of our conquests and thus, thanks be to God, things prospered with us. I have made a point of explaining this matter, because without the help of Doña Marina we could not have understood the language of New Spain and Mexico.

4 **The *Florentine Codex*.** In the decades following the conquest, a Franciscan monk, Bernardino de Sahagún, worked with indigenous partners to compile a history of Aztec society. Known today as the *Florentine Codex*, it contains images and text written in both Nahuatl and Spanish. The following excerpt describes the entry of the victorious Spanish into Tenochtitlan.

■ Next they went to Motecuhzoma's storehouse, in the place called Totocalco, where his personal treasures were kept. The Spaniards grinned like little beasts and patted each other with delight.

When they entered the hall of treasures, it was as if they had arrived in Paradise. They searched everywhere and coveted everything; they were slaves to their own greed….

They seized these treasures as they were their own, as if this plunder were merely a stroke of good luck. And when they had taken all the gold, they heaped up everything else in the middle of the patio.

La Malinche [Doña Marina] called all the nobles together. She climbed up to the palace roof and cried: "Mexicanos, come forward! The Spaniards need your help! Bring them food and pure water. They are tired and hungry; they are almost fainting from exhaustion! Why do you not come forward? Are you angry with them?"

The Mexicas were too frightened to approach. They were crushed by terror and would not risk coming forward. They shied away as if the Spaniards were wild beasts, as if the hour were midnight on the blackest night of the year. Yet they did not abandon the Spaniards to hunger and thirst. They brought them whatever they needed, but shook with fear as they did so. They delivered the supplies to the Spaniards with trembling hands, then turned and hurried away.

ANALYZING THE EVIDENCE

1. How would you compare the attitudes toward Doña Marina displayed in Cortés's letter to the Spanish crown (Source 1) and Díaz's account of the conquest (Source 2)?

Why would Cortés downplay his reliance on Doña Marina in correspondence with the Spanish king?

2. What skills and experience enabled Doña Marina to act as an intermediary between the Spanish and the Aztecs? Based on the evidence, what role did she play in interactions between the Spanish and the Aztecs?
3. According to Díaz (Source 2), how did Doña Marina feel about her relationship with Cortés and the Spanish? How do you interpret this passage? Is there any evidence in the other sources that supports or undermines the sentiments he attributed to her?
4. Based on the evidence of these sources, what role did indigenous women play in relations between Spanish and Aztec men? How exceptional was Doña Marina?

PUTTING IT ALL TOGETHER

Using the sources above, along with what you have learned in class and in this chapter, imagine the events and experiences described in these sources from Doña Marina's point of view. Reflect on the various aspects of Doña Marina described in the sources — betrayed daughter, slave, concubine, mother, wife, interpreter, and commander — and write an essay that uses her experience to explore the interaction among Spanish, Aztec, and other indigenous groups during the conquest period.

Portuguese Brazil

Unlike Mesoamerica or the Andes, the territory of Brazil contained no urban empires but instead had roughly 2.5 million nomadic and settled people divided into small tribes and many different language groups. In 1500 the Portuguese crown named Pedro Álvares Cabral commander of a fleet headed for the spice trade of the Indies. En route, the fleet sailed far to the west, claiming the coast where they accidentally landed for Portugal under the terms of the Treaty of Tordesillas. The Portuguese soon undertook a profitable trade with local people in brazilwood, a valued source of red dye, which inspired the name of the new colony.

In the 1520s Portuguese settlers brought sugarcane production to Brazil. They initially used enslaved indigenous laborers on sugar plantations, but the rapid decline in the indigenous population soon led to the use of forcibly transported Africans. In Brazil the Portuguese thus created a new form of colonization in the Americas: large plantations worked by enslaved people. This model of slave-worked sugar plantations would spread throughout the Caribbean in the seventeenth century.

Colonial Administration

By the end of the sixteenth century the Spanish and Portuguese had successfully overcome most indigenous groups and expanded their territory throughout modern-day Mexico, the southwestern United States, and Central and South America. In Mesoamerica and the Andes, the Spanish had taken over the cities and tribute systems of the Aztecs and the Incas, basing their control on the prior existence of well-established polities with organized tribute systems.

While early conquest and settlement were conducted largely by private initiatives, the Spanish and Portuguese governments soon assumed more direct control. In 1503 the Spanish granted the port of Seville a monopoly over all traffic to the New World and established the House of Trade to oversee economic matters. In 1523 Spain created the Royal and Supreme Council of the Indies, with authority over all colonial affairs subject to approval by the king. Spanish territories themselves were divided initially into two **viceroyalties**, or administrative divisions: New Spain, created in 1535; and Peru, created in 1542. In the eighteenth century two new viceroyalties, New Granada and La Plata, were created (see Map 16.2).

viceroyalties The name for the four administrative units of Spanish possessions in the Americas: New Spain, Peru, New Granada, and La Plata.

Within each territory, the viceroy, or imperial governor, exercised broad military and civil authority. The viceroy presided over the *audiencia* (ow-dee-EHN-see-ah), a board of judges that served as his advisory council and the highest judicial body. As in Spain, settlement in the Americas was centered on cities and towns. In each city, the municipal council, or *cabildo*, exercised local authority. Women were denied participation in public life, a familiar pattern from both Spain and precolonial indigenous society.

Portugal adopted similar patterns of rule, with India House in Lisbon functioning much like the Spanish House of Trade and royal representatives overseeing Portuguese possessions in West Africa and Asia. To secure the vast expanse of Brazil, in the 1530s the Portuguese implemented a distinctive system of rule, called **captaincies**, hereditary grants of land given to nobles and loyal officials who bore the costs of settling and administering their territories. Over time, the Crown secured greater power over the captaincies, appointing royal governors to act as administrators. The captaincy of Bahia was the site of the capital, Salvador, home to the governor general and other royal officials.

captaincies A system established by the Portuguese in Brazil in the 1530s, whereby hereditary grants of land were given to nobles and loyal officials who bore the costs of settling and administering their territories.

The Catholic Church played an integral role in Iberian rule. The papacy allowed Portuguese and Spanish officials greater control over the church than was the case at home, allowing them to appoint clerics and collect tithes. This control allowed colonial powers to use the church as an instrument to indoctrinate indigenous people (see “Religious Conversion”).

Indigenous Population Loss and Economic Exploitation

From the time of Christopher Columbus in Hispaniola, the Spanish made use of the **encomienda system** to profit from the peoples and territories they encountered in the Americas. This system was a legacy of the methods used to reward military leaders in the time of the reconquista. First in the Caribbean and then on the mainland, conquistadors granted their followers the right to forcibly employ groups of indigenous people as laborers and to demand tribute payments from them in exchange for providing food, shelter, and instruction in the Christian faith. This system was first used in Hispaniola to work gold fields and then in Mexico for agricultural labor and, when silver was discovered in the 1540s, for silver mining.

encomienda system A system whereby the Spanish crown granted the conquerors the right to forcibly employ groups of indigenous people as laborers and to demand tribute payments from them in exchange for providing food, shelter, and instruction in the Christian faith.

A 1512 Spanish law authorizing the use of the encomienda (en-ko-me-EN-duh) called for indigenous people to be treated fairly, but in practice the system led to terrible abuses. Spanish missionaries publicized these abuses, leading to debates in Spain about the nature and proper treatment of indigenous people (see “European Debates About Indigenous Peoples”). King Charles I responded to such complaints in 1542 with the New Laws, which set limits on the authority of encomienda holders.

The New Laws provoked a revolt among elites in Peru and were little enforced throughout Spanish territories. Nonetheless, the Crown gradually gained control over encomiendas in central areas of the empire and required indigenous people to pay tributes in cash, rather than in labor. To respond to a shortage of indigenous workers, royal officials established a new government-run system of forced labor, called *repartimiento* in New Spain and *mita* in Peru. Administrators assigned a certain percentage of the inhabitants of native communities to labor for a set period each year in public works, mining, agriculture, and other tasks.

Spanish systems for exploiting the labor of indigenous peoples were both a cause of and a response to the disastrous decline in their numbers that began soon after the arrival of Europeans. Some indigenous people died as a direct result of the violence of conquest and the disruption of agriculture and trade caused by warfare. The most important cause of death, however, was infectious disease. Having little or no resistance to diseases brought from the Old World, the inhabitants of the New World fell victim to smallpox, typhus, influenza, and other illnesses.

Spanish Exploitation of Indigenous Labor This image depicts Spanish conquistadors supervising indigenous laborers as they carry arms along the steep road from Veracruz to Tlaxcala in 1520. It was part of a larger painting, produced in the postconquest era and known as the *Lienzo de Tlaxcala*, that tells the story of the alliance between the Tlaxcala kingdom and the Spanish and their defeat of the Aztec Empire.

The pattern of devastating disease and population loss established in the Spanish colonies was repeated everywhere Europeans settled. Overall, population declined by as much as 90 percent or more but with important regional variations. In general, densely populated urban centers were worse hit than rural areas, and tropical, low-lying regions suffered more than cooler, higher-altitude ones.

Colonial administrators responded to native population decline by forcibly combining dwindling indigenous communities into new settlements and imposing the rigors of the encomienda and the repartimiento. By the end of the sixteenth century the search for fresh sources of labor had given birth to the new tragedy of the Atlantic slave trade (see “Sugar and Early Transatlantic Slavery”).

Patterns of Settlement

The century after the discovery of silver in 1545 marked the high point of Iberian immigration to the Americas. Although the first migrants were men, soon whole families began to cross the Atlantic, and the European population began to increase through natural reproduction. By 1600 American-born Europeans, called *Creoles*, outnumbered immigrants.

Iberian settlement was predominantly urban in nature. Spaniards settled into the cities and towns of the former Aztec and Inca Empires as the native population dwindled through death and flight. They also established new cities in which settlers were quick to develop urban institutions familiar to them from home: city squares, churches, schools, and universities.

Despite the growing number of Europeans and the rapid decline of the native population, Europeans remained a small minority of the total inhabitants of the Americas. Iberians had sexual relationships with native women, leading to the growth of a substantial population of mixed Iberian and Indian descent known as *mestizos* (meh-STEE-zohz). The large-scale arrival of enslaved Africans, starting in Brazil in the mid-sixteenth century, added new ethnic and racial dimensions to the population.

The Era of Global Contact

How was the era of global contact shaped by new commodities, commercial empires, and forced migrations?

The centuries-old Afroeurasian trade world was forever changed by the European voyages of discovery and their aftermath. For the first time, a truly global economy emerged in the sixteenth and seventeenth centuries, and it forged new links among far-flung peoples, cultures, and societies. The ancient civilizations of Europe, Africa, the Americas, and Asia confronted each other in new and rapidly evolving ways. Those confrontations often led to conquest, forced migration, and brutal exploitation, but they also contributed to cultural exchange and new patterns of life.

The Columbian Exchange

The travel of people and goods between the Old and New Worlds led to an exchange of animals, plants, and diseases, a complex process known as the **Columbian exchange**. As we have seen, the introduction of new diseases to the Americas had devastating consequences. But other results of the exchange brought benefits not only to the Europeans but also to native peoples.

Columbian exchange The exchange of animals, plants, and diseases between the Old and the New Worlds.

Everywhere they settled, the Spanish and Portuguese brought and raised wheat. Grapes and olives brought over from Spain did well in parts of Peru and Chile. Perhaps the most significant introduction to the diet of Native Americans came via the meat and milk of the livestock that the early conquistadors brought with them, including cattle, sheep, and goats. The horse enabled both the Spanish conquerors and native populations to travel faster and farther and to transport heavy loads more easily.

In turn, Europeans returned home with many food crops that became central elements of their diet. Crops originating in the Americas included tomatoes, squash, pumpkins, peppers, and many varieties of beans, as well as tobacco. One of the most important of such crops was maize (corn). By the late seventeenth century maize had become a staple in Spain, Portugal, southern France, and Italy, and in the eighteenth century it became one of the chief foods of southeastern Europe and southern China. Even more valuable was the nutritious white potato, which slowly spread from west to east, contributing everywhere to a rise in population.

While the exchange of foods was a great benefit to cultures across the world, the introduction of European pathogens to the New World had a disastrous impact on the native population. In Europe infectious diseases like smallpox, measles, and influenza — originally spread through contact with domestic animals — killed many people each year. Over centuries of dealing with these diseases, the European population had had time to adapt. Prior to contact with Europeans, indigenous peoples of the New World suffered from insect-borne diseases and some infectious ones, but their lack of domestic livestock spared them the host of highly infectious diseases known in the Old World. The arrival of Europeans spread these microbes among a totally unprepared population, and they fell victim in vast numbers (see “Indigenous Population Loss and Economic Exploitation”). The world after Columbus was thus unified by disease as well as by trade and colonization.

Sugar and Early Transatlantic Slavery

Two crucial and interrelated elements of the Columbian exchange were the transatlantic trade in sugar and slaves. Throughout the Middle Ages, slavery was deeply entrenched in the Mediterranean, but it was not based on race. How, then, did black African slavery enter the European picture and take root in South and then North America? In 1453 the Ottoman capture of Constantinople halted the flow of European slaves from the eastern Mediterranean. Additionally, the successes of the Christian reconquest of the Iberian Peninsula drastically diminished the supply of Muslim captives. Cut off from its traditional sources of slaves, Mediterranean Europe turned to sub-Saharan Africa, which had a long history of slave trading.

As Portuguese explorers began their voyages along the western coast of Africa in the 1440s, one of the first commodities they sought was slaves. While the first slaves were simply seized by small raiding parties, Portuguese merchants soon found that it was easier and more profitable to trade with African leaders, who were accustomed to dealing in enslaved people captured through warfare with neighboring powers. In 1483 the Portuguese established an alliance with the kingdom of Kongo. The royal family eventually converted to Christianity, and Portuguese merchants intermarried with Kongolese women, creating a permanent Afro-Portuguese community. From 1490 to 1530 Portuguese traders brought between three hundred and two thousand enslaved Africans to Lisbon each year.

Indians Working in a Spanish Sugar Mill Belgian engraver Theodore de Bry published many images of the European exploration and settlement of the New World. De Bry never crossed the Atlantic himself, instead basing his images on travel accounts and other firsthand sources. This image depicts the exploitation of indigenous people in a Spanish sugar mill.

In this stage of European expansion, the history of slavery became intertwined with the history of sugar. In the Middle Ages, sugarcane — native to the South Pacific — was brought to Mediterranean islands. Population increases and greater prosperity in the fifteenth century led to increasing demand for sugar. The establishment of sugar plantations on the Canary and Madeira Islands in the fifteenth century after Iberian colonization testifies to this demand.

Sugar was a particularly difficult crop to produce for profit, requiring constant, backbreaking labor. The invention of roller mills to crush the cane more efficiently meant that yields could be significantly augmented, but only if a sufficient labor force was found to supply the mills. Plantation owners solved the labor problem by forcing first native islanders and then transported Africans to perform the backbreaking work.

The transatlantic slave trade that would ultimately result in the forced transport of over 12 million individuals began in 1518, when Spanish king Charles I authorized traders to bring enslaved Africans to New World colonies. The Portuguese brought the first slaves to Brazil around 1550.

After its founding in 1621, the Dutch West India Company transported thousands of Africans to Brazil and the Caribbean, mostly to work on sugar plantations. In the late seventeenth century, with the chartering of the Royal African Company, the English began to bring slaves to Barbados and other English colonies in the Caribbean and mainland North America.

The Transatlantic Slave Trade

Before 1700, when slavers decided it was better business to improve conditions, some 20 percent of slaves died on the voyage from Africa to the Americas.[2] The most common cause of death was dysentery induced by poor-quality food and water, lack of sanitation, and intense crowding. On sugar plantations, death rates among enslaved people from illness and exhaustion were extremely high. Driven by rising demands for plantation crops, the tragic transatlantic slave trade reached its height in the eighteenth century.

Spanish Silver and Its Economic Effects

The sixteenth century has often been called Spain's golden century, but silver mined in the Americas was the true source of Spain's wealth. In 1545, at an altitude of fifteen thousand feet, the Spanish discovered an extraordinary source of silver at Potosí (poh-toh-SEE) (in present-day Bolivia) in unsettled territory captured from the Inca Empire. By 1550 Potosí yielded perhaps 60 percent of all the silver mined in the world. From Potosí and the mines at Zacatecas (za-kuh-TAY-kuhs) and Guanajuato (gwah-nah-HWAH-toh) in Mexico, huge quantities of precious metals poured forth.

Mining became the most important industry in the colonies. Millions of indigenous laborers suffered brutal conditions and death in the silver mines. Demand for new sources of labor for the mines also contributed to the intensification of the African slave trade. Profits for the Spanish crown were immense. The Crown claimed the quinto, one-fifth of all precious metals mined in South America, which represented 25 percent of its total income. Between 1503 and 1650, 35 million pounds of silver and over 600,000 pounds of gold entered Seville's port.

Spain's immense profits from silver paid for the tremendous expansion of its empire and for the large armies that defended it. However, the easy flow of money also dampened economic innovation. It exacerbated the rising inflation Spain was already experiencing in the mid-sixteenth century, a period of growing population and stagnant production. Several times between 1557 and 1647, King Philip II and his successors wrote off the state debt, thereby undermining confidence in the government and destroying the economy. When the profitability of the silver mines diminished in the 1640s, Spain's power was fundamentally undercut.

As Philip II paid his armies and foreign debts with silver bullion, Spanish inflation was transmitted to the rest of Europe. Between 1560 and 1600 prices in most parts of Europe doubled and in some cases quadrupled. Because money bought less, people who lived on fixed incomes, such as nobles, were badly hurt. Those who owed fixed sums of money, such as the middle class, prospered because in a time of rising prices, debts lessened in value each year. Food costs rose most sharply, and the poor fared worst of all.

In many ways, though, it was not Spain but China that controlled the world trade in silver. The Chinese demanded silver for their products and for the payment of imperial taxes. China was thus the main buyer of world silver, absorbing half the world's production. The silver market drove world trade, with New Spain and Japan acting as major sources of the supply of silver and China dominating demand. The world trade in silver is one of the best examples of the new global economy that emerged in this period.

The Birth of the Global Economy

With Europeans' discovery of the Americas and their exploration of the Pacific, the entire world was linked for the first time in history by seaborne trade. The opening of that trade brought into being three successive commercial empires: the Portuguese, the Spanish, and the Dutch.

In the sixteenth century the Portuguese controlled the sea route to India

(Map 16.3). From their bases at Goa on the Arabian Sea and at Malacca on the Malay Peninsula, ships carried goods to the Portuguese settlement at Macao. From Macao Portuguese ships loaded with Chinese silks and porcelains sailed to Japan and the Philippines, where Chinese goods were exchanged for Spanish silver from New Spain. Throughout Asia the Portuguese traded in slaves, some of whom were brought all the way across the Pacific to Mexico. (See "Individuals in Society: Catarina de San Juan," page 460.) They also exported horses from Mesopotamia and copper from Arabia to India; from India they exported hawks and peacocks for the Chinese and Japanese markets. Back to Portugal they brought Asian spices that had been purchased with textiles produced in India and with gold and ivory from East Africa. From their colony in Brazil they also shipped back sugar, produced by African slaves whom they had transported across the Atlantic.

MAP 16.3 Seaborne Trading Empires in the Sixteenth and Seventeenth Centuries By the mid-seventeenth century trade linked all parts of the world except for Australia. Notice that trade in slaves was not confined to the Atlantic but involved almost all parts of the world.

Becoming an imperial power a few decades later than the Portuguese, the Spanish were determined to claim their place in world trade. The Spanish Empire in the New World was basically land based, but across the

Pacific the Spaniards built a seaborne empire centered at Manila in the Philippines. Established in 1571, the city of Manila served as the transpacific bridge between Spanish America and China. In Manila Spanish traders used silver from American mines to purchase Chinese silk for European markets. The European demand for silk was so huge that in 1597, for example, 12 million pesos of silver, almost the total value of the transatlantic trade, moved from Acapulco in New Spain to Manila.

In the seventeenth century the Dutch challenged the Spanish and Portuguese Empires. The Dutch East India Company was founded in 1602 with the stated intention of capturing the spice trade from the Portuguese. Drawing on their commercial wealth and long experience in European trade, the Dutch emerged by the end of the century as the most powerful worldwide seaborne trading power (see “The Dutch Trading Empire” in Chapter 18).

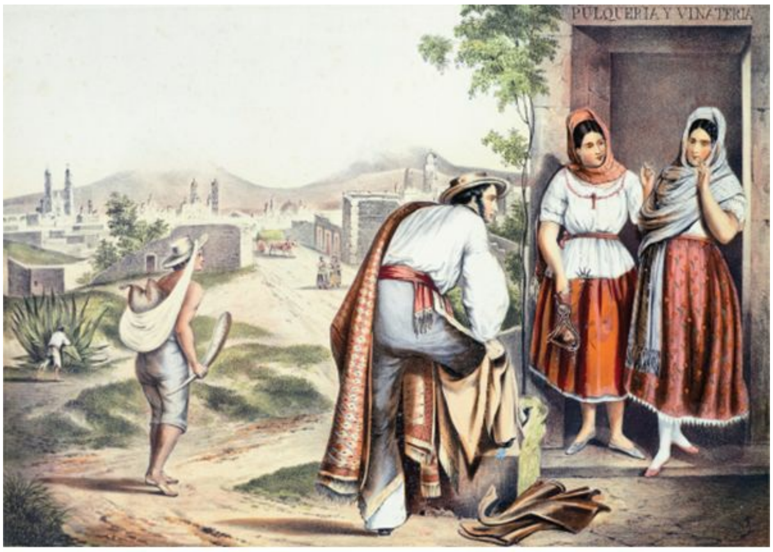
Catarina de San Juan



De Agostini Picture Library/Gianni Dagli Orti/Bridgeman Images

Women of Puebla, Mexico, in traditional clothing.

A LONG JOURNEY LED CATARINA DE SAN JUAN FROM enslavement in South Asia to adulation as a popular saint in Mexico. Her journey began on the west coast of India around 1610 when Portuguese traders captured a group of children, including the small girl who would become Catarina. Their ship continued around the southern tip of India, across the Bay of Bengal, through the Strait of Malacca, and across the South China Sea. It docked at Manila, a Spanish city in the Philippines, where the girl was sold at a slave auction. In 1619 Catarina boarded a ship that was part of the Manila Galleon, the annual convoy of Spanish ships that crossed the Pacific between Manila and the Mexican port of Acapulco. After a six-month voyage, Catarina arrived in Acapulco; she then walked to Mexico City and continued on to the city of Puebla.

In Puebla, Catarina became the property of a Portuguese merchant and worked as a domestic servant. She was one of thousands of *chinos*, a term for natives of the East Indies who were brought via the Philippines to Spanish America. Many were slaves, transported as part of a transoceanic slave trade that reached from the Indian Ocean to the South China Sea and across the Pacific to the Atlantic world. They constituted a small but significant portion of people forcibly transported by Europeans to the Americas in the late sixteenth and early seventeenth centuries to replace dwindling numbers of indigenous laborers. Chinos were considered particularly apt for domestic labor, and many wealthy Spanish Americans bought them in Manila.

Before crossing the Pacific, Catarina converted to Catholicism and chose her Christian name. In Puebla her master encouraged Catarina's faith and allowed her to attend mass every day. He also drafted a will emancipating her after his death, which occurred in 1619. With no money of her own, Catarina became the servant of a local priest. On his advice, Catarina reluctantly gave up her dream of becoming a lay sister and married a fellow chino named Domingo. The marriage was unhappy; Catarina reportedly refused to enter sexual relations with her husband and suffered from his debts, infidelity, and hostility to her faith. She found solace in renewed religious devotion, winning the admiration of priests and neighbors who flocked to her for spiritual comfort and to hear about her ecstatic visions. After fourteen years of marriage, Catarina became a widow and lived out her life in the home of wealthy supporters.

Catarina's funeral in 1688 drew large crowds. Her followers revered her as an unofficial saint, and soon the leaders of Puebla began a campaign to have Catarina beatified (officially recognized by the Catholic church as a saint). Her former confessors published accounts of her life emphasizing her piety, beauty, and exotic Asian origins and marveling at the miraculous preservation of her virginity through the perils of enslavement, long journeys at sea, and marriage. Much of what we know about Catarina derives from these sources and must be viewed as idealized, rather than as strictly historically accurate.

The Spanish Inquisition, which oversaw the process of beatification, rejected Catarina's candidacy and, fearing that popular adulation might detract from the authority of the church, forbade the circulation of images of and texts about her. Despite this ban, popular reverence for Catarina de San Juan continued, and continues to this day in Mexico.

QUESTIONS FOR ANALYSIS

1. Why would the Inquisition react so negatively to popular devotion to Catarina? What dangers did she pose to the Catholic Church in New Spain?
2. What does Catarina's story reveal about the global nature of the Spanish Empire and the slave trade in this period? What does it reveal about divisions within the Catholic Church?

Changing Attitudes and Beliefs

How did new encounters shape cultural attitudes and beliefs in Europe and the rest of the world?

The age of overseas expansion heightened Europeans' contacts with the rest of the world. These contacts gave birth to new ideas about the inherent superiority or inferiority of different races. Religion became another means of cultural contact, as European missionaries aimed to spread Christianity in both the New World and East Asia. The East-West contacts also led to exchanges of influential cultural and scientific ideas.

Religious Conversion

Converting indigenous people to Christianity was one of the most important justifications for European expansion. The first missionaries to the New World accompanied Columbus on his second voyage, and more than 2,500 Franciscans, Dominicans, Jesuits, and other friars crossed the Atlantic in the following century. Jesuit missionaries were also active in Japan and China in the sixteenth and seventeenth centuries, until authorities banned their teachings.

Catholic friars were among the first Europeans to seek an understanding of native cultures and languages as part of their effort to render Christianity comprehensible to indigenous people. They were also the most vociferous opponents of abuses committed by Spanish settlers.

Religion had been a central element of pre-Columbian societies, and many, if not all, indigenous people were receptive to the new religion that accompanied the victorious Iberians. (See "Global Viewpoints: Aztec and Spanish Views on Christian Conversion in New Spain," page 462.) In addition to spreading Christianity, missionaries taught indigenous peoples European methods of agriculture and instilled obedience to colonial masters. Despite the success of initial conversion efforts, authorities could not prevent the melding together of Catholic teachings with elements of pagan beliefs and practices.

GLOBAL VIEWPOINTS

Aztec and Spanish Views on Christian Conversion in New Spain

In justifying their violent conquest of the Aztec and Inca civilizations, Spanish conquistadors emphasized the need to bring Christianity to heathen peoples. For the conquered, the imposition of Christianity and the repression of their pre-existing religions were often experienced as yet another form of loss. The first document describes the response of the recently vanquished Aztec leaders of Tenochtitlan to Franciscan missionaries. Despite resistance, missionaries eventually succeeded in converting much of the indigenous population to Catholicism. In the second document, a firsthand account of the Spanish conquest written a few decades after the fall of Tenochtitlan, Bernal Díaz del Castillo expresses great satisfaction at the Catholic piety of some indigenous communities.

Aztec Response to the Franciscans’ Explanation of Their 1524 Mission

■ You have told us that we do not know the One who gives us life and being, who is Lord of the heavens and of the earth. You also say that those we worship are not gods. This way of speaking is entirely new to us, and very scandalous. We are frightened by this way of speaking because our forebears who engendered and governed us never said anything like this. On the contrary, they left us this our custom of worshiping our gods, in which they believed and which they worshiped all the time that they lived here on earth. They taught us how to honor them. And they taught us all the ceremonies and sacrifices that we make. They told us that through them [our gods] we live and are, and that we were beholden to them, to be theirs and to serve countless centuries before the sun began to shine and before there was daytime. They said that these gods that we worship give us everything we need for our physical existence: maize, beans, chia seeds, etc.…

All of us together feel that it is enough to have lost, enough that the power and royal jurisdiction have been taken from us. As for our gods, we will die before giving up serving and worshiping them.

Bernal Díaz del Castillo, from *The True History of the Conquest of New Spain, 1521*

■ It is a thing to be grateful for to God, and for profound consideration, to see how the natives assist in celebrating a holy Mass.… There is another good thing they do [namely] that both men, women and children, who are of the age to learn them, know all the holy prayers in their own languages and are obliged to know them. They have other good customs about their holy Christianity, that when they pass near a sacred altar or Cross they bow their heads with humility, bend their knees, and say the prayer "Our Father," which we Conquistadores have taught them, and they place lighted wax candles before the holy altars and crosses, for formerly they did not know how to use wax in making candles. In addition to what I have said, we taught them to show great reverence and obedience to all the monks and priests, and, when these went to their pueblos, to sally forth to receive them with lighted wax candles and to ring the bells, and to feed them very well…. Beside the good customs reported by me they have others both holy and good, for when the day of Corpus Christ comes, or that of Our Lady, or other solemn festivals when among us we form processions, most of the pueblos in the neighbourhood of this city of Guatemala come out in procession with their crosses and lighted wax tapers, and carry on their shoulders, on a litter, the image of the saint who is the patron of the pueblo.

QUESTIONS FOR ANALYSIS

1. What reasons do the leaders of Tenochtitlan offer for rejecting the teachings of Franciscan missionaries? What importance do they accord their own religious traditions?
2. What evidence does Díaz provide for the conversion of the indigenous people in the city of Guatemala?
3. How and why do you think the attitudes of indigenous peoples might have evolved from those expressed in the first document to those described in the second? Do you think the second document tells the whole story of religious attitudes under Spanish rule?

European Debates About Indigenous Peoples

Iberian exploitation of the native population of the Americas began from the moment of Columbus’s arrival in 1492. Denunciations of this abuse by Catholic missionaries, however, quickly followed, inspiring vociferous debates in both Europe and the colonies about the nature of indigenous peoples and how they should be treated. Bartolomé de Las Casas (1474–1566), a Dominican friar and former encomienda holder, was one of the earliest and most outspoken critics of the brutal treatment inflicted on indigenous peoples.

Mounting criticism in Spain led King Charles I to assemble a group of churchmen and lawyers to debate the issue in 1550 in the city of Valladolid. One side of the **Valladolid debate**, led by Juan Ginés de Sepúlveda, argued that conquest and forcible conversion were both necessary and justified to save indigenous people from the horrors of human sacrifice, cannibalism, and idolatry. To counter these arguments, Las Casas and his supporters depicted indigenous people as rational and innocent children, who deserved protection and tutelage from more advanced civilizations.

Valladolid debate A debate organized by Spanish king Charles I in 1550 in the city of Valladolid that pitted defenders of Spanish conquest and forcible conversion against critics of these practices.

Elsewhere in Europe, audiences also debated these questions. Eagerly reading denunciations of Spanish abuses by critics like Las Casas, they derived the **Black Legend** of Spanish colonialism, the notion that the Spanish were uniquely brutal and cruel in their conquest and settlement of the Americas. This legend helped other European powers overlook their own record of colonial violence and exploitation.

Black Legend The notion that the Spanish were uniquely brutal and cruel in their conquest and settlement of the Americas, an idea propagated by rival European powers.

New Ideas About Race

At the beginning of the transatlantic slave trade, most Europeans grouped

Africans into the despised categories of pagan heathens or Muslim infidels. As Europeans turned to Africa for new sources of slaves, they drew on myths about Africans' primitiveness and barbarity to defend slavery. (See “Analyzing the Evidence: Mixed Races,” page 463.)

Over time, the institution of slavery fostered a new level of racial inequality. Africans gradually became seen as utterly distinct from and wholly inferior to Europeans. In a transition from rather vague assumptions about Africans' non-Christian religious beliefs and general lack of civilization, Europeans developed increasingly rigid ideas of racial superiority and inferiority to safeguard the growing profits gained from plantation slavery. Black skin became equated with slavery itself as Europeans at home and in the colonies convinced themselves that blacks were destined by God to serve them as slaves in perpetuity.

Support for this belief went back to the Greek philosopher Aristotle's argument that some people are naturally destined for slavery and to biblical associations between darkness and sin, derived from the biblical story of Noah's curse upon the descendants of his disobedient son Ham to be the “servant[s] of servants.” Biblical genealogies listing Ham's sons as those who peopled North Africa and Cush (which includes parts of modern Egypt and Sudan) were read to mean that all inhabitants of those regions bore Noah's curse.

When Spanish settlers came to the Americas, they brought with them the religious and racial prejudices of the old country. One of the most important of these was the doctrine of *limpieza de sangre,* or purity of blood. This principle was originally adopted during the reconquista to distinguish Spaniards whose ancestors had always been Christian and who were therefore not tainted (in Christians' eyes) by the blood of Jewish or Muslim converts. After the conquest, the Spanish applied this notion in the Americas; because indigenous peoples had never been exposed to Christianity — the Spanish reasoned — they could not be considered impure like Jews and Muslims. Africans, however, fell into the same heretical category as Jews and Muslims. These distinctions help explain why the Spanish decided indigenous people could not be enslaved, while Africans and those of African descent could.

Despite these obsessions with racial purity, Spanish America from its first years was characterized by a high degree of racial mixing, which began as male conquistadors formed unions with women of high-ranking indigenous families. With the arrival of some thirty-five thousand enslaved Africans in Mexico during the sixteenth century, the mixing of peoples increased. Many of these unions were forced, with Spanish men seeking concubines among indigenous women and enslaved women of African descent. The fact that children inherited their legal status from their mothers encouraged enslaved men to seek wives among indigenous and *mestiza* (mixed) women. Defying neat boundaries that were supposed to exist between racial categories, the children born of these unions were viewed with suspicion by state and religious officials, and they suffered from a range of discriminatory laws.

An elaborate terminology emerged to describe the many possible combinations of indigenous, African, and European blood, which were known collectively as *castas*. *Mestizos* referred to people of mixed Spanish and Indian descent, whereas *mulattos* were those of Spanish and African origin. This painting belongs to a genre, known as casta paintings, that emerged in the late seventeenth century in Mexico and depicted couples composed of individuals of different ethnic origin and the children produced of their unions. This genre reflects the ambivalent fascination inspired by the unprecedented mixing of peoples in Spanish America.

QUESTIONS FOR ANALYSIS

1. What do these images suggest about the racial composition of the population of Spanish America and the interaction of people with different racial and ethnic backgrounds?
2. Who do you think the audience might have been for these images, and why would viewers be fascinated by them?
3. What elements of this chapter might suggest that these are romanticized or idealized depictions of relations among different racial and ethnic groups?

Chapter Summary

Prior to Columbus's voyages, well-developed trade routes linked the peoples and products of Africa, Asia, and Europe. Overall, Europe played a minor role in the Afroeurasian trade world. As the economy and population recovered from the Black Death, Europeans began to seek more direct and profitable access to the Afroeurasian trade world. Technological innovations, many borrowed from the East, enabled explorers to undertake ever more ambitious voyages.

In the aftermath of their conquests of Caribbean islands and the Aztec and Inca Empires, the Spanish established new forms of governance to dominate indigenous peoples and exploit their labor. The arrival of Europeans brought enormous population losses to native communities, primarily through the spread of infectious diseases. Disease was one element of the Columbian exchange, a complex transfer of germs, plants, and animals between the Old and New Worlds. These exchanges contributed to the creation of the first truly global economy. Tragically, a major component of global trade was the transatlantic slave trade, in which Europeans transported Africans to labor in the sugar plantations and silver mines of the New World. European nations vied for supremacy in global trade, with early Portuguese success in India and Asia being challenged first by the Spanish and then by the Dutch.

Increased contact with the outside world led Europeans to develop new ideas about cultural and racial differences. Debates occurred in Spain and its colonies over the nature of the indigenous peoples of the Americas and how they should be treated. Europeans had long held negative attitudes about Africans; as the slave trade grew, they began to express more rigid notions of racial inequality and to claim that Africans were inherently suited for slavery. Religion became another means of cultural contact, as European missionaries aimed to spread Christianity in the New World.

CONNECTIONS

Just two years separated Martin Luther's attack on the Catholic Church in 1517 and Ferdinand Magellan's discovery of the Pacific Ocean in 1520. Within a few short years western Europeans' religious unity and notions of terrestrial geography were shattered. In the ensuing decades Europeans struggled to come to terms with religious differences among Protestants and Catholics at home and with the multitudes of new peoples and places they encountered abroad. Like Muslim forces in the first centuries of Islam, Christian Europeans brought their religion with them and sought to convert conquered peoples to their faith. While some Europeans were fascinated and inspired by this new diversity, too often the result was suffering and violence. Europeans endured decades of religious civil war, and indigenous peoples overseas underwent massive population losses as a result of European warfare, disease, and exploitation. Both Catholic and Protestant religious leaders condoned the trade in slaves that ultimately brought suffering and death to millions of Africans.

Even as the voyages of discovery contributed to the fragmentation of European culture, they also played a role in state centralization and consolidation in the longer term. Henceforth, competition to gain overseas colonies became an integral part of European politics. While Spain’s enormous profits from conquest ultimately led to a weakening of its power, over time the Netherlands, England, and France used profits from colonial trade to help build modernized, centralized states.

Two crucial consequences emerged from this era of expansion. The first was the creation of enduring contacts among five of the seven continents of the globe — Europe, Asia, Africa, North America, and South America. From the sixteenth century onward, the peoples of the world were increasingly entwined in divergent forms of economic, social, and cultural exchange. The second was the growth of European power. Europeans controlled the Americas and gradually assumed control over existing trade networks in Asia and Africa. Although China remained the world’s most powerful economy until at least 1800, the era of European dominance was born.

Review the Main Ideas

Answer the focus questions from each section of the chapter.

1. What was the Afroeurasian trade world prior to the era of European exploration? (p. 438)
2. How and why did Europeans undertake ambitious voyages of expansion? (p. 441)
3. What was the impact of Iberian conquest and settlement on the peoples and ecologies of the Americas? (p. 449)
4. How was the era of global contact shaped by new commodities, commercial empires, and forced migrations? (p. 456)
5. How did new encounters shape cultural attitudes and beliefs in Europe and the rest of the world? (p. 459)

Make Comparisons and Connections

Analyze the larger developments and continuities within and across chapters.

1. If Europe was at the periphery of the global trading system prior to 1492, where was it situated by the middle of the sixteenth century? What had changed? What had not?
2. How does the spread of Christianity in the aftermath of European conquest in

the New World compare with the earlier spread of Christianity under the Roman Empire (Chapter 6) and the spread of Buddhism (Chapter 7) and Islam (Chapters 9, 10, 12)?

3. How did European expansion in the period covered in this chapter draw on earlier patterns of trade and migration in Africa (Chapter 10) and Asia (Chapters 12, 13)?
4. To what extent did the European voyages of expansion and conquest inaugurate an era of global history? Did this era represent the birth of “globalization”? Why or why not?

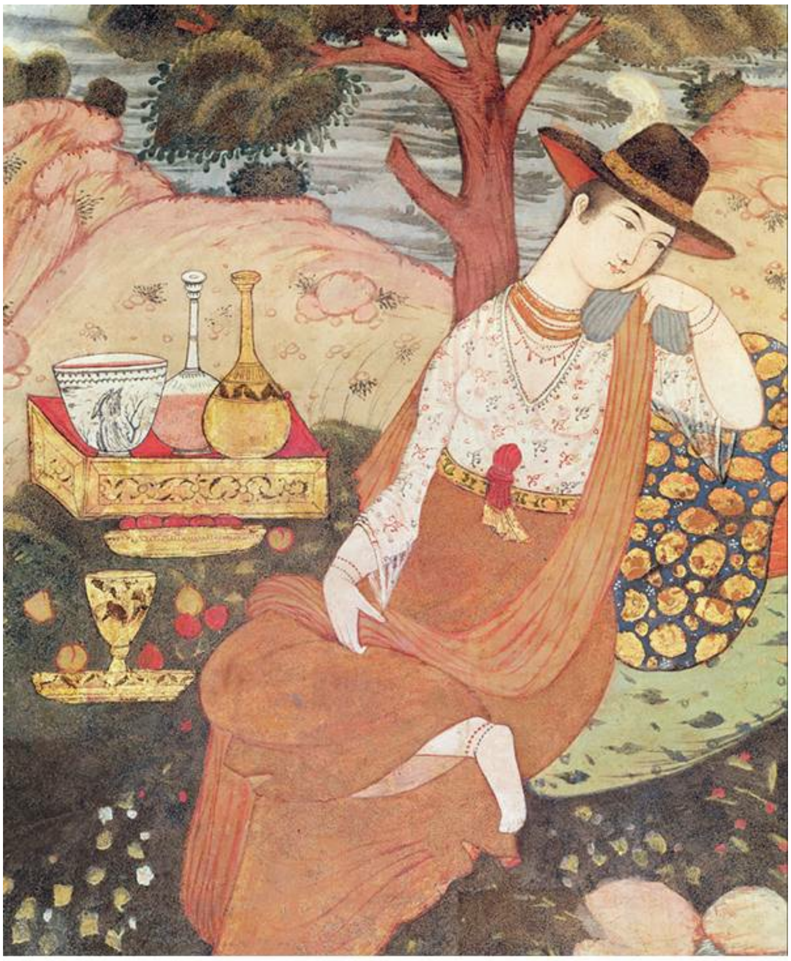
The Islamic World Powers

1300–1800



Chehel Sotoun, or *The 40 Columns*, Isfahan, Iran/Bridgeman Images

Persian Princess

The ruling houses of the Islamic empires were great patrons of art and architecture. This depiction of a princess in a garden is from an early-seventeenth-century palace built by Shah Abbas of the Safavid

Dynasty in Persia.

After the decline of the Mongol Empire in the mid-fourteenth century, powerful Islamic states emerged in south and west Eurasia. By the sixteenth century the Ottoman Empire, centered in Anatolia; the Safavid (SAH-fah-vid) Empire in Persia; and the Mughal (MOO-guhl) Empire in India controlled vast territories from West Africa to Central Asia, from the Balkans to the Bay of Bengal.

Lasting more than six centuries (1299–1922), the Ottoman Empire was one of the largest, best-organized, and most enduring political entities in world history. In Persia (now Iran) the Safavid Dynasty created a Shi'a state and presided over a brilliant culture. In India the Mughal leader Babur and his successors gained control of much of the Indian subcontinent. Mughal rule inaugurated a period of radical administrative reorganization in India and the flowering of intellectual and architectural creativity. Although these three states were often at war with each other, they shared important characteristics and challenges. Their ruling houses all emerged from Turkish tribal organizations, and they all had to adapt their armies to the introduction of firearms. Over time, they became strongly linked culturally, as merchants, poets, philosophers, artists, and military advisers moved relatively easily across their political boundaries. Before the end of this period, Europeans were also active in trade in these empires, especially in India.

The Turkish Ruling Houses: The Ottomans, Safavids, and Mughals

How were the three Islamic empires established, and what sorts of governments did they set up?

Before the Mongols arrived in Central Asia and Persia, another nomadic people from the region of modern Mongolia, the Turks, had moved west, gained control over key territories from Anatolia to Delhi in north India, and contributed to the decline of the Abbasid caliphate in the thirteenth century. As Mongol strength in Persia and Central Asia deteriorated in the late thirteenth to mid-fourteenth centuries, the Turks resumed their expansion. In the late fourteenth century the Turkish leader Timur (1336–1405), also called Tamerlane, built a Central Asian empire from his base in Samarkand that reached into India and through Persia to the Black Sea. After his death, his sons and grandson fought each other for succession, and by 1450 his empire was in rapid decline. Meanwhile, Sufi orders (groups of Islamic mystics) thrived, and Islam became the most important force integrating the region. It was from the many small Turkish chiefs that the founders of the three main empires emerged.

The Expansion of the Ottoman Empire

The **Ottomans** took their name from Osman (r. 1299–1326), the chief of a band of seminomadic Turks that had migrated into western Anatolia while the Mongols still held Persia. The Ottomans gradually expanded at the expense of other small Turkish states and the Byzantine Empire (Map 17.1). Although temporarily slowed by defeat at the hands of Timur in 1402, the Ottomans quickly reasserted themselves after Timur's death in 1405.

Mapping the Past

MAP 17.1 The Ottoman Empire at Its Height, 1566 The Ottomans, like their great rivals the Habsburgs, rose to rule a vast dynastic empire encompassing many different peoples and ethnic groups. The army and the bureaucracy served to unite the disparate territories into a single state.

ANALYZING THE MAP Trace the coastlines of the Ottoman Empire. What were the major port cities of the empire? Which regions were encompassed within the empire at its height?

CONNECTIONS If the Ottoman Empire is compared to Europe of the same period (see Map 18.2), which had more of its territory near the sea? How did proximity to the Mediterranean shape the politics of Ottoman-European relations in this period?

Ottomans Ruling house of the Turkish empire that lasted from 1299 to 1922.

Osman's campaigns were intended to subdue, not to destroy. The Ottomans built their empire by absorbing the Muslims of Anatolia and by becoming the protector of the Orthodox Church and of the millions of Greek Christians in Anatolia and the Balkans. A series of victories between 1326 and 1352 made the Ottomans masters of the Balkans. After these victories, the Ottomans made slaves of many captives and trained them as soldiers. These troops were outfitted with guns and artillery and trained to use them effectively.

Sultan Mehmet II Mehmet was called “the Conqueror” because at age twenty-one he captured Constantinople and ended the Byzantine Empire, but he is also known for his patronage of the arts and appreciation of beauty.

In 1453, during the reign of Sultan Mehmet II (r. 1451–1481), the Ottomans conquered Constantinople, capital of the Byzantine Empire, which had lasted a thousand years. Once Constantinople was theirs, the Ottoman **sultans** (supreme political and military rulers) considered themselves successors to both the Byzantine and Seljuk Turk emperors, and they quickly absorbed the rest of the Byzantine Empire. In the sixteenth century they continued to expand through the Middle East and into North Africa.

sultan An Arabic word used by the Ottomans to describe a supreme political and military ruler.

To begin the transformation of Constantinople (renamed Istanbul) into an imperial Ottoman capital, Mehmet ordered wealthy residents to build mosques, markets, fountains, baths, and other public facilities. To make up for the loss of population through war, Mehmet transplanted inhabitants of other territories to the city, granting them tax remissions and possession of empty houses. He wanted them to start businesses, make Istanbul prosperous, and transform it into a microcosm of the empire.

Gunpowder, which was invented by the Chinese and adapted to artillery use by the Europeans, played an influential role in the expansion of the Ottoman state. Mastering this technology, the Ottomans used it to gain control of shipping in the eastern Mediterranean and eliminate the Portuguese from the Red Sea and the Persian Gulf. In 1514, under the superb military leadership of Selim (r. 1512–1520), the Ottomans turned the Safavids back from Anatolia. When the Ottomans acquired Syria and Palestine (1516) and Egypt (1517), they gained control of the holy cities of Islam. Before long the Ottomans had extended their rule across North Africa to Tunisia and Algeria. For the next four centuries a majority of Arabs lived under Ottoman rule.

Suleiman I (r. 1520–1566) extended Ottoman dominion to its widest geographical extent (see Map 17.1). Suleiman's army crushed the Hungarians at Mohács in 1526, killing the king and thousands of his nobles. Three years later the Turks unsuccessfully besieged the Habsburg capital of Vienna. From the late fourteenth to the early seventeenth centuries, the Ottoman Empire was a key player in European politics. In 1525 Francis I of France and Suleiman struck an alliance; both believed that only their collaboration could prevent Habsburg domination of Europe. The Habsburg emperor Charles V retaliated by seeking an alliance with Safavid Persia. Suleiman renewed the French agreement with Francis's son, Henry II (r. 1547–1559), and this accord became the cornerstone of Ottoman policy in western Europe. Ottoman pressure contributed to the official recognition of Lutheran Protestants at the Peace of Augsburg in 1555 and the consolidation of the national monarchy in France.

Though usually victorious on land, the Ottomans did not enjoy complete dominion on the seas. Competition with the Habsburgs and pirates for control of the Mediterranean led the Ottomans to conquer Cyprus in 1570 and settle thousands of Turks from Anatolia there. In response, Pope Pius V organized a Holy League against the Turks, which won a victory in 1571 at Lepanto off the west coast of Greece with a squadron of more than two hundred Spanish, Venetian, and papal galleys. Still, the Turks remained supreme on land and quickly rebuilt their entire fleet.

To the east, war with Safavid Persia occupied the sultans' attention throughout the sixteenth and well into the seventeenth century. Several issues lay at the root of the long and exhausting conflict: religious antagonism between the Sunni Ottomans and the Shi'a Persians, competition to expand at each other's expense in Mesopotamia, desire to control trade routes, and European alliances. (For more on the Shi'a faith, see "The Safavid Empire in Persia.") Finally, in 1638 the Ottomans captured Baghdad, and the treaty of Kasr-I-Shirim established a permanent border between the two powers.

The Ottoman political system reached its classic form under Suleiman I. All authority flowed from the sultan to his public servants: provincial governors, police officers, military generals, heads of treasuries, and **viziers** (chief assistants to caliphs). Suleiman ordered Lütfi Paşa (d. 1562), a poet and juridical scholar of slave origin, to draw up a new general code of laws that prescribed penalties for routine criminal acts such as robbery, adultery, and murder. It also sought to reform bureaucratic and financial corruption, such as foreign merchants' payment of bribes to avoid customs duties, imprisonment without trial, and promotion in the provincial administration because of favoritism rather than ability. The legal code also introduced the idea of balanced government budgets. The head of the religious establishment was given the task of reconciling sultanic law with Islamic law.

viziers Chief assistants to caliphs.

The Ottomans ruled their more distant lands, such as those in North Africa, relatively lightly. Governors of distant provinces collected taxes and maintained trade routes, but their control did not penetrate deeply into the countryside.

The Ottoman Empire’s Use of Slaves

The power of the Ottoman central government was sustained through the training of slaves. Slaves were captured in battle; purchased from Spain, North Africa, and Venice; or drafted through the system known as **devshirme**, by which the sultan’s agents compelled Christian families in the Balkans to sell their boys. The slave boys were converted to Islam and trained for the imperial civil service and the standing army. The brightest 10 percent entered the palace school, where they learned to read and write Arabic, Ottoman Turkish, and Persian in preparation for administrative jobs. Other boys were sent to Turkish farms, where they acquired physical toughness in preparation for military service. Known as **janissaries** (Turkish for “recruits”), they formed the elite army corps. Thoroughly indoctrinated and absolutely loyal to the sultan, the janissary corps adapted easily to the use of firearms. The devshirme system enabled the Ottomans to apply merit-based recruitment to military and administrative offices at little cost and provided a means of assimilating Christians living in Ottoman lands.

devshirme A process whereby the sultan’s agents swept the provinces for Christian youths to be trained as soldiers or civil servants.

janissaries Turkish for “recruits”; they formed the elite army corps.

The Ottoman ruling class included people of varied ethnic origins who rose through the bureaucratic and military ranks, many beginning as the sultan’s slaves. In return for their services to the sultan, they held landed estates for the duration of their lives. Because all property belonged to the sultan and reverted to him on the holder’s death, Turkish nobles, unlike their European counterparts, did not have a local base independent of the ruler. The absence of a hereditary nobility and of private ownership of agricultural land differentiates the Ottoman system from European feudalism.

Another distinctive characteristic of the Ottomans was the sultan’s failure to marry. From about 1500 on, the sultans did not contract legal marriages but perpetuated the ruling house through concubinage. A slave **concubine** (a woman who is a recognized spouse but of lower status than a wife) could not expect to exert power the way a local or foreign noblewoman could. (For a notable exception, see “Individuals in Society: Hürrem,” page 474.) When one of the sultan’s concubines delivered a boy, she raised him until the age of ten or eleven. Then the child was given a province to govern under his mother’s supervision. Because succession to the throne was open to all the sultan’s sons, fratricide often resulted upon his death, and the losers were blinded or executed.

concubine A woman who is a recognized spouse but of lower status than a wife.

Slave concubinage paralleled the Ottoman development of slave soldiers and slave viziers. All held positions entirely at the sultan’s pleasure, owed loyalty solely to him, and were thus more reliable than a hereditary nobility. Great social prestige, as well as the opportunity to acquire power and wealth, was attached to being a slave of the imperial household.

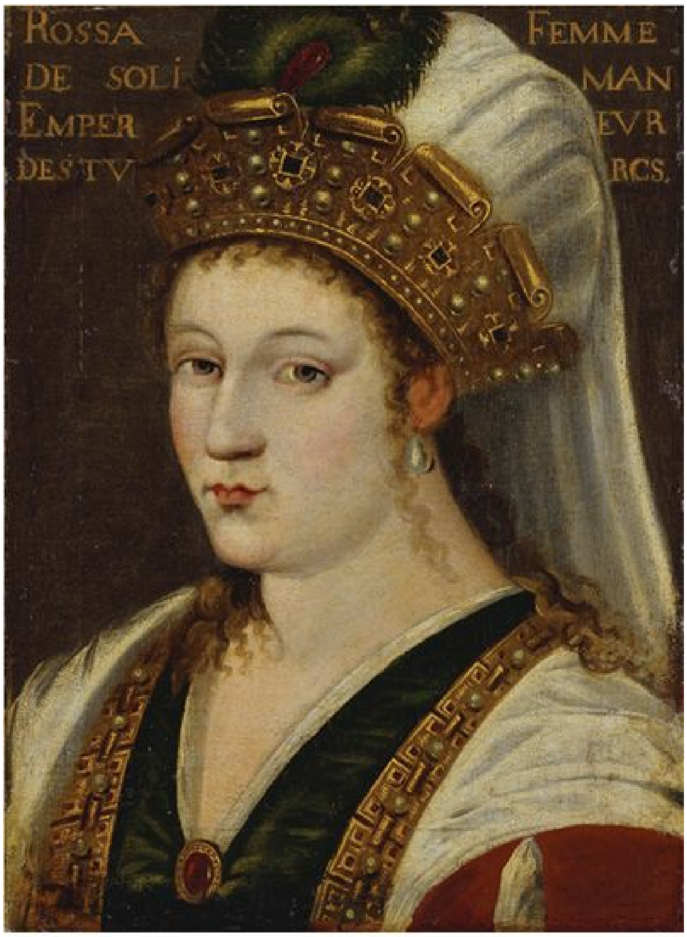
Hürrem



Rosa, Consort of Suleiman, Emperor of the Turks, ca. 1600–1670 [oil on canvas], French School/Royal Collections Trust © Her Majesty Queen Elizabeth II, 2017/Bridgeman Images

Hürrem depicted by a contemporary European artist.

HÜRREM (1505?–1558) WAS BORN IN THE WESTERN Ukraine (then part of Poland), the daughter of a Ruthenian priest, and was given the Polish name Aleksandra Lisowska. When Tartars raided, they captured and enslaved her. In 1520 she was given as a gift to Suleiman on the occasion of his accession to the throne. The Venetian ambassador (probably relying on secondhand or thirdhand information) described her as “young, graceful, petite, but not beautiful.” She was given the Turkish name Hürrem, meaning “joyful.”

Hürrem apparently brought joy to Suleiman. Their first child was born in 1521. By 1525 they had four sons and a daughter; sources note that by that year Suleiman visited no other woman. But he waited eight or nine years before breaking Ottoman dynastic tradition by making Hürrem his legal wife, the first slave concubine so honored. For the rest of her life, Hürrem played a highly influential role in the political, diplomatic, and philanthropic life of the Ottoman state. First, great power flowed from her position as mother of the prince, the future sultan Selim II (r. 1566–1574). Then, as the intimate and most trusted adviser of the sultan, she was Suleiman's closest confidant. During his frequent trips to the far-flung corners of his multiethnic empire, Hürrem wrote him long letters filled with her love and longing for him and her prayers for his safety in battle. She also shared political information about affairs in Istanbul, the activities of the grand vizier, and the attitudes of the janissaries. At a time when some people believed that the sultan's absence from the capital endangered his hold on the throne, Hürrem acted as his eyes and ears for potential threats.

Hürrem was the sultan's contact with her native Poland, which sent more embassies to Istanbul than any other power. Through her correspondence with King Sigismund I, peace between Poland and the Ottomans was maintained. When Sigismund II succeeded his father in 1548, Hürrem sent congratulations on his accession, along with two pairs of pajamas (originally a Hindu garment but commonly worn in southwestern Asia) and six handkerchiefs. Also, she sent the shah of Persia gold-embroidered sheets and shirts that she had sewn herself, seeking to display the wealth of the sultanate and to keep peace between the Ottomans and the Safavids.

The enormous stipend that Suleiman gave Hürrem permitted her to participate in his vast building program. In Jerusalem (in the Ottoman province of Palestine) she founded a hospice for fifty-five pilgrims that included a soup kitchen that fed four hundred pilgrims a day. In Istanbul Suleiman built and Hürrem endowed the Haseki (meaning "royal favorite concubine") mosque complex and a public bath for women near the Women's Market.

Perhaps Hürrem tried to fulfill two functions hitherto distinct in Ottoman political theory: those of the sultan's favorite and of mother of the prince. She also performed the conflicting roles of slave concubine and imperial wife. Many Turks resented Hürrem's interference at court. They believed she was behind the execution of Suleiman's popular son Mustafa on a charge of treason to make way for her own son to succeed as sultan.

QUESTIONS FOR ANALYSIS

1. How does Hürrem compare to powerful women in other places, such as Empress Wu in China, Isabella of Castile, Catherine de' Medici of France, Elizabeth I of England, or any other you know about?
2. What was Hürrem's "nationality"? What role did it play in her life?

The Safavid Empire in Persia

With the decline of Timur’s empire after 1450, Persia was controlled by Turkish lords, with no single one dominant until 1501, when fourteen-year-old Isma’il (1487–1524) led a Turkish army to capture Tabriz and declared himself **shah** (Persian word for “king”).

shah Persian word for “king.”

The strength of the early **Safavid** state rested on three crucial features. First, the Safavid state utilized the skills of urban bureaucrats and made them an essential part of the civil machinery of government. Second, it secured the loyalty and military support of nomadic Turkish Sufis known as **Qizilbash** (KIH-zihl-bahsh) (a Turkish word meaning “redheads” that was applied to these people because of the red hats they wore). In return for the vast grazing lands granted to them, the Qizilbash supplied the shah with troops.

Safavid The dynasty that ruled all of Persia and other regions from 1501 to 1722; its state religion was Shi’ism.

Qizilbash Nomadic Turkish Sufis who supplied the early Safavid state with military troops in exchange for grazing rights.

The third source of Safavid strength was the Shi’a faith, which became the compulsory religion of the empire. The Shi’a believed that leadership among Muslims rightfully belonged to the Prophet Muhammad’s descendants. Because Isma’il claimed descent from a line of twelve infallible imams (leaders) beginning with Ali (Muhammad’s cousin and son-in-law), he was officially regarded as their representative on earth. Isma’il recruited Shi’a scholars to instruct and guide his people, and he persecuted and exiled Sunni **ulama** (religious scholars who interpret the Qur’an and the Sunna, the deeds and sayings of Muhammad). To this day, Iran remains the only Muslim state in which Shi’ism is the official religion.

ulama Religious scholars who interpret the Qur’an and the Sunna, the deeds and sayings of Muhammad.

Safavid power reached its height under Shah Abbas (r. 1587–1629), who moved the capital from Qazvin to Isfahan. His military achievements, support for trade and commerce, and endowment of the arts earned him the epithet “the Great.” In the military realm he adopted the Ottoman practice of building an army of slaves, primarily captives from the Caucasus, and used them as a counterweight to the Qizilbash, who had come to be considered a threat. He also increased the use of gunpowder weapons and made alliances with European powers against the Ottomans and Portuguese. In his campaigns against the Ottomans, Shah Abbas captured Baghdad, Mosul, and Diarbakr in Mesopotamia (Map 17.2).

MAP 17.2 The Safavid Empire, 1587–1629 In the late sixteenth century the power of the Safavid kingdom of Persia rested on its strong military force, its Shi'a Muslim faith, and its extraordinarily rich trade in rugs and pottery. Many of the cities on the map, such as Tabriz, Qum, and Shiraz, were great rug-weaving centers.

Conflict between the Ottomans and the Safavids was not an even match. The Safavids did not have as many people or as much wealth as the Ottomans and continually had to defend against encroachments on their western border. Still, they were able to attract some of the Turks in Ottoman lands who felt that their government had shifted too far from its nomadic roots. After Shah Abbas, Safavid power was sapped by civil war between tribal factions vying for control of the court.

The Mughal Empire in India

Of the three great Islamic empires of the early modern world, the **Mughal** Empire of India was the largest, wealthiest, and most populous. Extending over 1.2 million square miles at the end of the seventeenth century, with a population between 100 and 150 million, and with fabulous wealth and resources, the Mughal Empire surpassed the other two by a wide margin. In the sixteenth century only the Ming Dynasty in China could compare.

Mughal A term used to refer to the Muslim empire of India, which was the largest, wealthiest, and most populous of the Islamic empires of the early modern world.

The Mughal Empire, 1526–1857

In 1504 Babur (r. 1483–1530), a Turkish ruler forced out of a small territory in Central Asia, captured Kabul and established a kingdom in Afghanistan. An adventurer who claimed descent from Chinggis Khan and Timur, Babur moved southward in search of resources to restore his fortunes. In 1526, with a force of only twelve thousand men equipped with firearms, Babur defeated the sultan of Delhi at Panipat. Babur's capture of the cities of Agra and Delhi, key fortresses of the north, paved the way for further conquests in northern India. Although many of his soldiers wished to return north with their spoils, Babur decided to stay in India.

A gifted writer, Babur wrote an autobiography in Turkish that recounts his military campaigns, describes places and people he encountered, reports his difficulties giving up wine, and shows his wide-ranging interests in everything from fruit and swimming to a Turkish general who excelled at leapfrog. He was not particularly impressed by India, as can be inferred from this description in his memoirs:

> Hindustan is a country which has few pleasures to recommend it. The people are not handsome. They have no idea of the charms of friendly society, of frankly mixing together, or familiar discourse. They have no genius, no comprehension of mind, no politeness of manner, no kindness or fellow-feeling, no ingenuity or mechanical invention in planning or executing their handicraft works, no skill or knowledge in design or architecture; they have no horses, no good flesh, no grapes or muskmelons, no good fruits, no ice or cold water, no good food or bread in their bazaars, no baths or colleges, no candles, no torches, not a candlestick.[1]

During the reign of Babur's son Humayun (r. 1530–1540 and 1555–1556), the Mughals lost most of their territories in Afghanistan. Humayun went into temporary exile in Persia, where he developed a deep appreciation for Persian art and literature. The reign of Humayun's son Akbar (r. 1556–1605) may well have been the greatest in the history of India. A boy of thirteen when he succeeded to the throne, Akbar pursued expansionist policies. Under his dynamic leadership, the Mughal state took definitive form and encompassed most of the subcontinent north of the Godavari River. No kingdom or coalition of kingdoms could long resist Akbar's armies. The once-independent states of northern India were forced into a centralized political system under the sole authority of the Mughal emperor.

Akbar replaced Turkish with Persian as the official language of the Mughal Empire, and Persian remained the official language until the British replaced it with English in 1835. To govern this vast region, Akbar developed an administrative bureaucracy centered on four co-equal ministers: finance; the army and intelligence; the judiciary and religious patronage; and the imperial household, whose jurisdiction included roads, bridges, and infrastructure throughout the empire. Under Akbar's Hindu finance minister, Raja Todar Mal, a uniform system of taxes was put in place. In the provinces imperial governors were appointed by and responsible solely to the emperor. Whereas the Ottoman sultans and Safavid shahs made extensive use of slaves acquired from non-Muslim lands for military and administrative positions, Akbar used the services of royal princes, nobles, and warrior-aristocrats. Initially these men were

Muslims from Central Asia, but to reduce their influence, Akbar vigorously recruited Persians and Hindus. No single ethnic or religious faction could challenge the emperor.

Akbar’s descendants extended the Mughal Empire further. His son Jahangir (r. 1605–1628) consolidated Mughal rule in Bengal. (See “Global Viewpoints: Mughal and French Views on Priorities for Monarchs,” at right.) Jahangir’s son Shah Jahan (r. 1628–1658) launched fresh territorial expansion. Faced with dangerous revolts by the Muslims in Ahmadnagar and the resistance of the newly arrived Portuguese in Bengal, Shah Jahan not only crushed this opposition but also strengthened his northwestern frontier. Shah Jahan’s son Aurangzeb (r. 1658–1707), unwilling to wait for his father to die, deposed him and confined him for years in a small cell. A puritanically devout and strictly orthodox Muslim, as well as a skillful general and a clever diplomat, Aurangzeb ruled more of India than did any previous Mughal emperor, having extended the realm deeper into south India. His reign, however, also marked the beginning of the empire’s decline. His non-Muslim subjects were not pleased with his religious zealotry, and his military campaigns were costly. In the south resistance to Mughal rule led to major uprisings. (For more on Aurangzeb’s rule, see “Non-Muslims Under Muslim Rule.”)

GLOBAL VIEWPOINTS

Mughal and French Views on Priorities for Monarchs

Jahangir, the fourth Mughal emperor, was as much a patron of the arts as a military commander. Like his great-grandfather Babur, he wrote a memoir. Jahangir's representation of himself and his actions in the memoir can be compared to that of the French king Louis XIV, less than a century later, whose advice to his heir has been preserved.

Jahangir's *Memoirs*

■ At that period when I took my departure from Lahore for Agra, on the occasion recently described, it happily occurred to me to direct that the different landholders on that route should plant at every town and village, and every stage and halting place, all the way from Lahore to Agra, mulberry and other large and lofty trees affording shade, but particularly those with broad leaves and wide-spreading branches, in order that to all time to come the way-worn and weary traveler might find under their shadow repose and shelter from the scorching rays of the sun during the summer heats. . . . And, lastly, at the passage of every river, whether large or small, convenient bridges were erected, so that the industrious traveler might be able to pursue his objects without obstruction or delay. . . .

With regard to the maxims which should govern the policy of sovereign princes, it has been said, that to resolve without the concurrence of men of experience is the most fallacious of proceedings; but I contend, nevertheless, that there is no safety in council, unless founded in rectitude of mind. I maintain, that if we entrust the concerns of the state to the opinions of another, we give to the Almighty an associate in the secrets of the heart. . . . He that conducts the destinies of his country by the judgment of another, must not forget that he will nevertheless be himself responsible, at the awful day of account, for all the exactions, the tyranny, the unjust decisions, violence, and oppression to which the people may have been exposed, through such imprudent delegation. It is from the reigning sovereign that the awful reckoning will be required, not from those who have been his advisers.

Louis XIV's *Memoirs*

■ The cleverest private individuals take advice from other clever people about their little concerns. What should be the rule for kings who have in their hands the public weal, and whose resolutions harm or benefit the whole earth? Decisions of such importance should never be formed, if possible, without calling upon all the most enlightened, reasonable and wise among our subjects. . . . Besides, our lofty position in some way separates us from our people to whom our ministers are closer, and are consequently able to see a thousand things of which we know nothing, but on which nevertheless we must make up our minds and take measures. Add to this their age, experience, deliberations, and their greater liberty to obtain information and suggestions from their inferiors, who in their turn gather them from others, step by step down to the lowest.

But when on important occasions they have reported to us all the aspects and all the opposing reasons, all that is done elsewhere in similar cases, all that has been done formerly, and all that might be done today, it is incumbent upon us, my son, to choose what must be actually done. And in regard to that choice I will make bold to tell you that if we do not lack good sense or courage there is no other who can make a better one than us.

QUESTIONS FOR ANALYSIS

1. Are you more impressed by the similarities between these two monarchs' comments on consultation with advisers or by the differences? What might account for the similarities and the differences?
2. What can you infer about the personalities of these two monarchs from their remarks?
3. Jahangir describes in great detail the improvements to the roads in his empire. Why would a ruler take pride in the improvement of roads?

Cultural Flowering

What cultural advances occurred under the rule of the Ottoman, Safavid, and Mughal Empires?

All three Islamic empires presided over extraordinary artistic and intellectual flowering in everything from carpetmaking to architecture and gardening, from geography and astronomy to medicine. At the same time, new religious practices (and conflicts) emerged, and people found new outlets for socializing and exchanging ideas. Artistic and intellectual advances spread from culture to culture, probably because of the common Persian influence on the Turks since the tenth century. This exchange was also aided by shared languages, especially Arabic, Turkish, and Persian. Persian was used as the administrative language by the Mughals in India, and Arabic was a lingua franca of the entire region because of its centrality in Islam. In Ottoman lands both Persian and Arabic were literary languages, but Turkish slowly became the lingua franca of the realm.

The Arts

One of the arts all three empires shared was carpetmaking. Carpet designs and weaving techniques demonstrate both cultural integration and local distinctiveness. Turkic migrants carried their weaving traditions with them as they moved but also readily adopted new motifs, especially from Persia. In Safavid Persia, Shah Abbas was determined to improve his country's export trade and built the small cottage business of carpet weaving into a national industry. In the capital city of Isfahan alone, factories employed more than twenty-five thousand weavers who produced woolen carpets, brocades, and silks of brilliant color, design, and quality. Women and children were often employed as weavers, especially of the most expensive rugs, because their smaller hands could tie tinier knots.

Another art that spread from Persia to both Ottoman and Mughal lands was miniature painting, especially for book illustration. There was an interplay between carpets and miniature painting. Naturalistic depictions of lotus blossoms, peonies, chrysanthemums, tulips, carnations, birds, and even dragons appear in both book illustrations and carpets.

In Mughal India, as throughout the Muslim world, books were regarded as precious objects. Time, talent, and expensive materials went into their production, and they were highly coveted because they reflected wealth, learning, and power. Akbar reportedly possessed twenty-four thousand books when he died. The historian Abu'l-Fazl described Akbar's library and love of books:

> His Majesty's library is divided into several parts. . . . Prose works, poetical works, Hindi, Persian, Greek, Kashmirian, Arabic, are all separately placed. In this order they are also inspected. Experienced people bring them daily and read them before His Majesty, who hears every book from beginning to end . . . and rewards the readers with presents of cash either in gold or silver, according to the number of leaves read out by them. . . . There are no historical facts of past ages, or curiosities of science, or interesting points of philosophy, with which His Majesty, a leader of impartial sages, is unacquainted.[2]

City and Palace Building

In all three empires strong rulers built capital cities and imperial palaces as visible expressions of dynastic majesty. Suleiman "the Magnificent" used his fabulous wealth and thousands of servants to adorn Istanbul with palaces, mosques, schools, and libraries. The building of hospitals, roads, and bridges and the reconstruction of the water systems of the great pilgrimage sites at Mecca and Jerusalem benefited his subjects. Safavid Persia and Mughal India produced rulers with similar ambitions.

The greatest builder under the Ottomans was Mimar Sinan (1491–1588), a Greek-born devshirme recruit who rose to become imperial architect under Suleiman. A contemporary of Michelangelo, Sinan designed 312 public buildings, including mosques, schools, hospitals, public baths, palaces, and burial chapels. His masterpieces, the Shehzade and Suleimaniye Mosques in Istanbul, were designed to maximize the space under the dome.

Shah Abbas made his capital, Isfahan, the jewel of the Safavid Empire. He had his architects place a polo ground in the center and surrounded it with palaces, mosques, and bazaars. In the bazaar one could find splendid rugs, pottery and fine china, metalwork of exceptionally high quality, and silks and velvets of stunning weave and design. A city of perhaps 750,000 people, Isfahan also contained 162 mosques, 48 schools where future members of the ulama learned the sacred Muslim sciences, 273 public baths, and the vast imperial palace. Mosques were richly decorated with blue tile. Private houses had their own garden courts, and public gardens, pools, and parks adorned the wide streets.

Among the Mughal emperors, Shah Jahan had the most sophisticated interest in architecture. Because his capital at Agra was cramped, in 1639 he decided to found a new capital city at Delhi. In the design and layout of the buildings, Persian ideas predominated. The walled palace-fortress alone extended over 125 acres. Built partly of red sandstone, partly of marble, it included private chambers for the emperor; mansions for the wives, widows, and concubines of the imperial household; huge audience rooms for the conduct of public business; baths; and vast gardens filled with flowers, trees, and thirty silver fountains spraying water. In 1650, with living quarters for guards, military officials, merchants, dancing girls, scholars, and hordes of cooks and servants, the palace-fortress housed fifty-seven thousand people. It also boasted a covered public bazaar.

Two Masterpieces of Islamic Architecture Istanbul’s Suleimaniye Mosque, designed by Sinan and commissioned by Suleiman I, was finished in 1557. Its interior (bottom) is especially spacious. The Taj Mahal, built about a century later in Agra in northern India, is perhaps the finest example of Mughal architecture. Its white marble exterior is decorated with Arabic inscriptions and floral designs.

For his palace, Shah Jahan ordered the construction of the Peacock Throne. This famous piece, encrusted with emeralds, diamonds, pearls, and rubies, took seven years to fashion and cost the equivalent of $5 million. It served as the imperial throne of India until 1739, when the Persian warrior Nadir Shah seized it as plunder and carried it to Persia.

Shah Jahan’s most enduring monument is the Taj Mahal. Between 1631 and 1648 twenty thousand workers toiled over the construction of this memorial in Agra to Shah Jahan’s favorite wife, who died giving birth to their fifteenth child. One of the most beautiful structures in the world, the Taj Mahal is both an expression of love and a superb architectural blending of Islamic and Indian culture.

Gardens

Many of the architectural masterpieces of this age had splendid gardens attached to them. Gardens represent a distinctive and highly developed feature of Persian culture. They commonly were walled, with a pool in the center and geometrically laid-out flowering plants, especially roses. Identified with paradise in Arab tradition, gardens served not only as centers of prayer and meditation but also as places of leisure and revelry. After the incorporation of Persia into the caliphate in the seventh century, formal gardening spread west and east through the Islamic world, as illustrated by the magnificent gardens of Muslim Spain, southern Italy, and, later, southeastern Europe. When Babur established the Mughal Dynasty in India, he adapted the Persian garden to the warmer southern climate. Gardens were laid out near palaces, mosques, shrines, and mausoleums, including the Taj Mahal, which had four water channels symbolizing the four rivers of paradise.

Polo Two teams of four on horseback ride back and forth on a field measuring 200 by 400 yards, trying to hit a 4½-ounce wooden ball with a 4-foot mallet through the opponent's goal. Because a typical match involves many high-speed collisions among the horses, each player has to maintain a string of expensive ponies in order to change mounts several times during the game. Students of the history of sports believe the game originated in Persia, as shown in this sixteenth-century miniature, and then spread to India, China, and Japan. Brought from India to England, where it became very popular among the aristocracy in the nineteenth century, polo is a fine example of cross-cultural influences.

Gardens, of course, are seasonal. To remind themselves of paradise during the cold winter months, rulers, city people, and nomads ordered Persian carpets, most of which feature floral patterns and have formal garden designs.

Intellectual Advances and Religious Trends

Between 1400 and 1800 the culture of the Islamic empires developed in many directions. Particularly notable were new movements within Islam as well as advances in mathematics, geography, astronomy, and medicine. Building on the knowledge of earlier Islamic writers and stimulated by Ottoman naval power, the geographer and cartographer Piri Reis created the *Book of the Sea* (1521), which contained 129 chapters, each with a map incorporating all Islamic (and Western) knowledge of the seas and navigation and describing harbors, tides, dangerous rocks and shores, and storm areas. In the field of astronomy, Takiyuddin Mehmet (1521–1585) built an observatory at Istanbul. His *Instruments of the Observatory* catalogued astronomical instruments and described an astronomical clock that fixed the location of heavenly bodies with greater precision than ever before.

There were also advances in medicine. Under Suleiman the imperial palace itself became a center of medical science, and the large number of hospitals established in Istanbul and throughout the empire testifies to his support for medical research and his concern for the sick. Abi Ahmet Celebi (1436–1523), the chief physician of the empire, produced a study on kidney and bladder stones. Recurrent outbreaks of the plague posed a challenge for physicians in Muslim lands. Muhammad had once said not to go to a country where an epidemic existed but also not to leave a place because an epidemic broke out. As a consequence, when European cities began enforcing quarantines to control the spread of the plague, early Muslim rulers dismissed such efforts. By the sixteenth century, however, a better understanding of contagion led to a redefinition of the proper response to a plague epidemic and allowed for leaving the city in search of clean air.

Illustrated Medical Manual The Turkish physician Serafeddin Sabuncuoglu (1385–1470) wrote a treatise of surgery in Turkish, with illustrations, in 1465. This page shows a physician cauterizing leprosy lesions.

In the realm of religion, the rulers of all three empires drew legitimacy from their support for Islam. The Sunni-Shi’a split between the Ottomans and Safavids led to efforts to define and enforce religious orthodoxy on both sides. For the Safavids this entailed suppressing Sufi movements and Sunnis, even marginalizing — sometimes massacring — the original Qizilbash warriors, who had come to be seen as politically disruptive. Sectarian conflicts within Islam were not as pronounced in Mughal lands, perhaps because Muslims were greatly outnumbered by non-Muslims, mostly Hindus.

Sufi fraternities thrived throughout the Muslim world in this era, even when the states tried to limit them. In India Sufi orders also influenced non-Muslims. The mystical Bhakti movement among Hindus involved dances, poems, and songs reminiscent of Sufi practice. The development of the new religion of the Sikhs (SEEKS) was also influenced by Sufis. The Sikhs traced themselves back to a teacher in the sixteenth century who argued that God did not distinguish between Muslims and Hindus but saw everyone as his children. Sikhs rejected the caste system (division of society into hereditary groups) and forbade alcohol and tobacco, and men did not cut their hair, covering it instead with a turban. The Sikh movement was most successful in northwest India, where Sikh men armed themselves to defend their communities.

Despite all the signs of cultural vitality in the three Islamic empires, none of them adopted the printing press or went through the sorts of cultural expansion associated with it in China and Europe. Until 1729 the Ottoman authorities prohibited printing books in Turkish or Arabic (Jews, Armenians, and Greeks could establish presses and print in their own languages). Printing was not banned in Mughal India, but neither did the technology spread, even after Jesuit missionaries printed Bibles in Indian languages beginning in the 1550s. The copying of manuscripts was a well-established practice, and those who made their living this way sometimes organized to keep competition at bay. It also needs to be noted that by the end of this period, scientific knowledge was not keeping up with advances made in Europe (see “The Scientific Revolution” in Chapter 19).

Coffeehouses and Their Social Impact

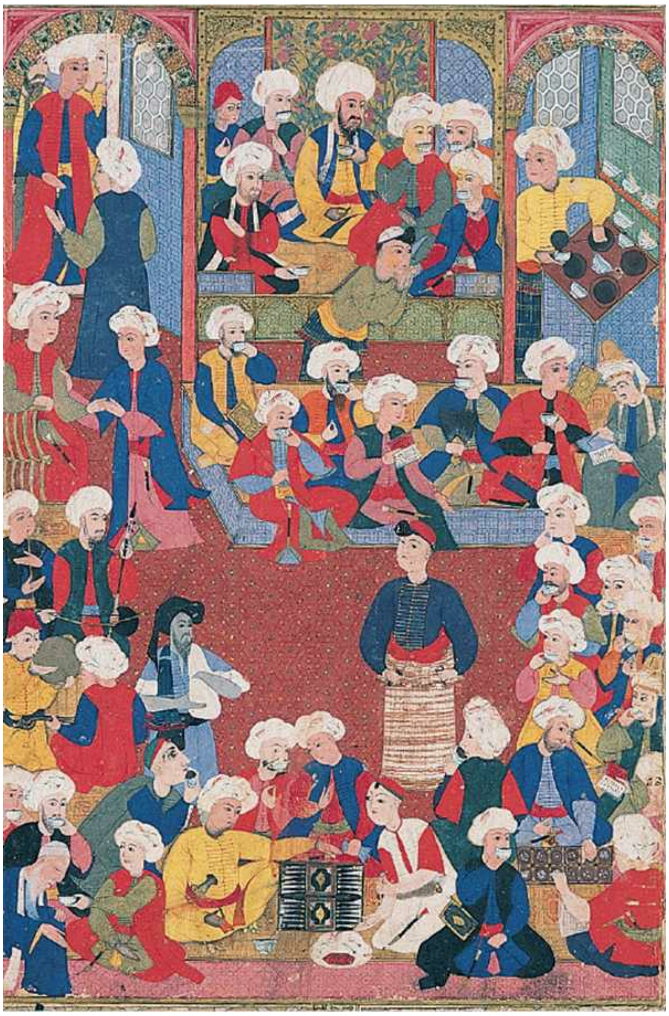
In the mid-fifteenth century a new social convention spread throughout the Islamic world — drinking coffee. Arab writers trace the origins of coffee drinking to Yemen Sufis, who sought a trancelike concentration on God to the exclusion of everything else and found that coffee helped them stay awake. Before long, coffee was being used as a business lubricant — an extension of hospitality to a potential buyer in a shop. Merchants carried the Yemenite practice to Mecca in about 1490. From Mecca, where pilgrims were introduced to it, coffee drinking spread to Egypt and Syria. In 1555 two Syrians opened a coffeehouse in Istanbul. (See “Analyzing the Evidence: Coffee Drinking,” above.)

Coffeehouses provided a place for conversation and male sociability; there a man could entertain his friends cheaply and more informally than at home. But coffeehouses encountered religious and governmental opposition: some people argued that coffee was intoxicating, making it analogous to wine, which was prohibited to Muslims, and others asserted that political discussion in coffeehouses could lead to sedition. On the other hand, the coffee trade was a major source of profit that local notables sought to control.

Although debate over the morality of coffeehouses continued through the sixteenth century, their eventual acceptance represented a revolution in Islamic life: socializing was no longer confined to the home. In the seventeenth century coffee and coffeehouses spread to Europe. (For reaction to another new product that spread quickly despite opposition, see “Analyzing the Evidence: Katib Chelebi on Tobacco,” above.)

ANALYZING THE EVIDENCE

Coffee Drinking



© The Trustees of the Chester Beatty Library, Dublin, Ireland/Bridgeman Images

Coffee beans are native to east Africa and were first grown in Ethiopia. They were brought to Yemen by Sufis in the fifteenth century. There the red beans were boiled in water to produce a hot beverage, which was appreciated for its ability to help participants stay awake during long rituals. By the sixteenth century coffee drinking had spread to other Islamic lands. By then people had learned to roast the beans and grind them finely before adding hot water.

In 1511 some conservative imams in Mecca ruled that coffee should be banned because of its stimulating effects, but the Ottoman sultan Suleiman I overturned their ruling in 1524, helping spread the custom of coffee drinking. As a caffeinated drink, coffee was much like tea. Both proved very popular even though they provided no calories. Because alcohol was forbidden to Muslims, coffee in some ways took its place, providing occasions for socializing either in coffeehouses or in homes or palaces.

This painting by an unknown Ottoman artist is in the Persian miniature style, which is noted for its bright colors and finely drawn details. Part of an album of painting and calligraphy on vellum (fine parchment), the image depicts a banquet where coffee drinking is part of the entertainment. The guests of honor are sitting in a recessed alcove, entertained by three musicians. An attendant in the upper right has a set of cups, and elsewhere in the picture men are shown sipping from cups.

QUESTIONS FOR ANALYSIS

1. How many individuals are shown sipping coffee? What other activities are depicted?
2. How does the artist convey differences in the ages of those drinking coffee?
3. Are there any women in the picture, or are the figures all men? How do you know?
4. Does this picture suggest any reasons why coffee became a popular drink?

ANALYZING THE EVIDENCE

Katib Chelebi on Tobacco

Katib Chelebi (1609–1657) was an Ottoman civil servant who spent much of his time as an accountant for the Turkish army, accompanying it on several important campaigns. Over time, he became passionate about learning and pursued not only Islamic law but also ancient Greek philosophy, geography, and modern European sciences. He wrote several important books, including a bibliographical encyclopedia. The book of essays from which the following extract comes also discusses such contemporary issues as coffee, singing, opium, shaking hands, bowing, and bribery.

Sometime in the latter half of the ninth century of the Hijra [in the fifteen century], after some Spanish ships had discovered the New World, the Portuguese and English were exploring its shores to find a passage from the Eastern to the Western Ocean. They came to an island* close to the mainland, called in the Atlas “Gineya.” Due to the negative impact of the humidity of the sea air on his nature, a doctor from the crew of the ship suffered from what appeared to be a lymphatic disorder. While he was looking for a cure, employing hot and dry things in accordance with the dictum “Cure is in the opposite,” his ship arrived at the aforementioned island, and he saw that some sort of a leaf was burning. Smelling its scent, he understood that it was a hot scent, and he started sucking the smoke through a pipe-like instrument. As he benefited from this, he collected a large quantity of that leaf and used it while he stayed there. The people on the ship, saying “This is a beneficial cure” and following his example, collected a lot of the leaf. They start smoking this way one after another. After the ship arrived in England, smoking spread to France and other places; without knowing about its origin and thinking that it can be used leisurely, people started smoking tobacco. Most of them became addicted and considered it a stimulating drug. As it became a common phenomena in the East and the West, it remained unhindered by prohibition.

It appeared around 1010 A.H. [1601 C.E.]. Since then various preachers mentioned it, and many learned men wrote treatises; some argued that it is religiously prohibited, and others disapproved. Those who were addicted, on the other hand, replied to these with their own treatises. After a while, in the court of the sultan [that is, in Istanbul], Şeyhi Ibrahim Efendi, the surgeon of the Palace, showed extreme care for the topic and talked about it at length and preached in the public seminar of Sultan Mehemmed Mosque and hung on the wall copies of the counsel and religious opinion [*fatwa*] in vain. As he talked about it, people smoked more and became more obstinate. Seeing it doesn't help, he gave in.

Later, towards the end of his reign, Sultan Murad IV [1612–1640] banned coffee houses in order to close down the door of evil acts and tobacco because it caused some fires [in the city]. When people disregarded the prohibition, the power of the Sultan necessitated reprimanding those who by smoking performed the sin of acting against the imperial order. Occasionally, [due to] the sultan's ruthlessness in suppression and in accordance with the dictum "Mankind craves what is forbidden," people's desire and craving to smoke equally increased. Many men were sent to the realm of nothingness due to this crime. At the encampments on the way to the Baghdad campaign, while fifteen to twenty leading soldiers were being executed in the presence of the sultan with extreme torment with the accusation of smoking tobacco, they still carried little pipes, some under their shirts, and some in their pockets and smoked at every opportunity. In Istanbul, there was no end to those who smoked in the barracks and public latrines. Even under such harsh suppression, those who smoked were more than those who didn't. After he [Sultan Murad IV] passed away, at times it was prohibited, and at times it was permitted, and finally, during the time of the late grand mufti Bahai Effendi issued a fatwa ruling that tobacco was permissible; among the people smoking became prevalent and popular once more. Yet, thanks to the fact that the high imperial order chastised the addicts from time to time, some quit. However, in all of the fourth of the world that is inhabited it was being smoked. Such is the story of tobacco. Now, let's consider the contexts for and characteristics of smoking in the form of a few arguments:

The first argument is that people can be prevented through prohibition and can quit tobacco. Since habit is second nature, we need to push aside this possibility. Addicts cannot be made to quit this way. . . .

The second discussion concerns the question of whether tobacco is good or bad with respect to reason. We can neglect the approval of it by addicts, and the intelligent accepted it as bad; either the judgment of good or bad have to be determined by both reason and religious law. . . .

The third argument is about its benefits and harmful effects. There is no doubt that it is financially harmful. However, since it becomes one of the most essential items for the addict, he doesn't mind its financial harm. Its harm on the body is well attested. Since tobacco pollutes the essence of air breathed by people, it is physically harmful.

The fourth argument is whether or not it is an innovation according to religion. It is an innovation according to the religious law, since it appeared in recent times. Moreover, it cannot be argued that it is an acceptable innovation. It is also rationally an innovation, because smoking hasn't been seen or heard of by the intelligent since the time of Adam. . . .

The fifth argument concerns if it is religiously abominable or not. There is no way to deny that it is abominable in reason and in religion; everyone has accepted this argument. Since the scent of tobacco smoke and the scent of its leaves are not abominable in themselves, for it to be accepted as abominable, its excessive use is a condition.[†] . . .

The sixth argument is about its being unlawful or not. To produce a judgment on a topic through independent reasoning is accepted as a method in books of religious law. There are sufficient conditions collected to proscribe tobacco through an analysis of available proof. Yet it is preferable not to proclaim it forbidden. It is recommended to accept it as religiously permissible in order to protect people from insisting on sin by doing forbidden acts through the application of a legal principle.

The seventh argument is whether or not it is religiously permissible. Since tobacco appeared in recent times, it is not clearly considered and mentioned in books of religious law. Consequently, following the dictum, "In things permissibility is inherent," smoking is considered as permissible and legitimate.

QUESTIONS FOR ANALYSIS

1. What do you learn about social life in the Ottoman Empire from this essay?
2. What can you infer about the sorts of arguments that were made by Islamic jurists in Katib Chelebi's day?
3. How open-minded was Katib Chelebi? What evidence from the text led you to your conclusion?

[*] Some learned people argue that since the name of the island meant "sheet [*tabaka*]," a sheet of tobacco is named after that. However, this claim couldn't be verified.

[†] For example, as long as one doesn't drink boza [a slightly intoxicating drink made from millet] to the level that he gets drunk it is not religiously prohibited.

Non-Muslims Under Muslim Rule

How did Christians, Jews, Hindus, and other non-Muslims fare under these Islamic states?

Drawing on Qur’anic teachings, Muslims had long practiced a religious tolerance unknown in Christian Europe. Muslim rulers for the most part guaranteed the lives and property of Christians and Jews in exchange for their promise of obedience and the payment of a poll tax. In the case of the Ottomans, this tolerance was extended not only to the Christians and Jews who had been living under Muslim rule for centuries but also to the Serbs, Bosnians, Croats, and other Orthodox Christians in the newly conquered Balkans. In 1454 Rabbi Isaac Sarfati sent a letter to the Jews in the Rhineland, Swabia, Moravia, and Hungary, urging them to move to Turkey because of the favorable treatment there. A massive migration to Ottoman lands followed. When Ferdinand and Isabella of Spain expelled the Jews in 1492 and later, many migrated to the Ottoman Empire.

The Safavid authorities made efforts to convert Armenian Christians in the Caucasus, and many seem to have embraced Islam, some more voluntarily than others. Nevertheless, the Armenian Christian Church retained its vitality, and under the Safavids Armenian Christians were prominent merchants in long-distance trade. (See “Thinking Like a Historian: Forced Relocation of Armenians to Persia,” page 486.)

Babur and his successors acquired even more non-Muslim subjects with their conquests in India, which included not only Hindus but also substantial numbers of Jains, Zoroastrians, Christians, and Sikhs. Over time, the number of Indians who converted to Islam increased, but the Mughal rulers did not force conversion. Akbar went the furthest in promoting Muslim-Hindu accommodation. He celebrated important Hindu festivals, such as Diwali, the festival of lights, and he wore his uncut hair in a turban as a concession to Indian practice. Also, Akbar twice married Hindu princesses, one of whom became the mother of his heir, Jahangir, and he appointed the Spanish Jesuit Antonio Monserrate (1536–1600) as tutor to one of his sons. Eventually, Hindus totaled 30 percent of the imperial bureaucracy.

Emperor Akbar in the City of Fatehpur Sikri In 1569 Akbar founded the city of Fatehpur Sikri (the City of Victory) to honor the Muslim holy man Sheik Salim Chishti, who had foretold the birth of Akbar's son and heir Jahangir. Akbar is shown here seated on the cushion in the center overseeing the construction of the city. The image is contained in the *Akbarnama*, a book of illustrations Akbar commissioned to officially chronicle his reign. (Victoria & Albert Museum, London, UK/Bridgeman Images)

Some of Akbar's successors, above all Aurangzeb, were less tolerant. Aurangzeb appointed censors of public morals in important cities to enforce Islamic laws against gambling, prostitution, drinking, and the use of narcotics. He forbade sati — the self-immolation of widows on their husbands' funeral pyres — and the castration of boys to be sold as eunuchs. He also abolished all taxes not authorized by Islamic law.

Aurangzeb’s reversal of Akbar’s religious tolerance and cultural cosmopolitanism extended further. He ordered the destruction of some Hindu temples and tried to curb Sikhism. He also required Hindus to pay higher customs duties than Muslims. Out of fidelity to Islamic law, he even criticized his mother’s tomb, the Taj Mahal: “The lawfulness of a solid construction over a grave is doubtful, and there can be no doubt about the extravagance involved.”[3] Aurangzeb’s attempts to enforce rigid Islamic norms proved highly unpopular and aroused resistance that weakened Mughal rule.

THINKING LIKE A HISTORIAN

Forced Relocation of Armenians to Persia

Many times over the course of history, people have been forced to move, often by new conquerors. Such was the fate of the Christian Armenian population when in 1603 Shah Abbas of Persia captured much of Armenia from the Ottomans. One group of Armenian merchants, moved from the town of Julfa to a new suburb of Isfahan, named New Julfa, fared relatively well, in part because Shah Abbas employed them as royal merchants and financiers.

1 **Iskandar Munshi, a Persian account of the Armenian deportation, 1616.** The court historian Iskandar Munshi (ca. 1560–ca. 1652) not surprisingly put a positive spin on Shah Abbas's deportation of the Armenians.

■ When [the Ottoman commander] Jegal-oglu reached Erivan, the Shah was camped near the . . . River. From there he dispatched Maqsud Sultan Kangarluy, . . . to transfer the civilian population of . . . Julfa to Isfahan. . . . There they were allotted land along the banks of the Zayanda, and houses with small gardens gradually grew up there; the properties were exempt from extraordinary taxes. Today, there are three thousand families living there, safe from the vicissitudes of fortune; the beauty of their new home had caused them to forget their former one.

2 **Arakel of Tabriz, an Armenian account of the deportation, 1658.** The Armenian historian Arakel of Tabriz (d. ca. 1670) presents the forced migration of perhaps a half million Armenians as a tragedy.

■ On the way, when they reached the small town of Julfa, the large and diverse population of the town, who had prepared themselves earlier, came out to greet the shah, as befitting a king. Old and young dressed and equipped, robed in magnificent garments of golden cloth, walked in a procession to greet the shah. Young lads carried sweet and precious wine in golden cups. With lit candles, frankincense and incense, and singing fine hymns, Armenian priests walked in front and sang with beautiful voices. . . .

After accomplishing all the tasks and undertakings that he had begun, the shah, together with his entire army, left Erevan and advanced toward Kars. . . . There, he informed his confidants about a plan that he had had in mind for a long time: to deport the Christian population and to destroy the land of Armenia. . . . Not one soul was to be left behind, be he a Christian or a Muslim, willing to leave or not. . . .

The Persian troops dispatched to drive the people forced them out and drove them from villages and towns; they set the places on fire, burning all the houses and dwellings without pity. The hay and straw, the wheat and barley, and other supplies stored by the people were all destroyed and burned as well. . . . For the Persians looked at the throng of people and their own army and saw that it was huge in numbers. It would take many days to transfer such a large mass across the river. . . . The numbers of people were great and there were not enough boats and rafts. . . .

The pitiless Persian soldiers drove the people and forced them to enter the water. When they waded into the river, fear made them wail and scream louder and louder. They began to cross, some grabbing a corner of a boat, others holding to rafts, others to the tails of horses, bulls, and oxen, and yet others by swimming. . . . Although some managed to swim across, many others perished by drowning.

[After being asked why he conferred favors on the Armenian merchants of New Julfa, Shah Abbas responded as follows.]

"Do not be angry over my fleeting and empty love toward them. Do not blame me, for I have brought them by force to our land. I have spent much money, effort, and tricks, not for their benefit, but for ours. They shall benefit our land and shall increase our population. If you kill the Christians who were driven from their land into ours, none will accept our faith. It would only make them fear us and secretly escape, one by one, to their own land."

3 **Jean Chardin, a French merchant's account of his travels, 1686.** The French jewelry merchant Jean Chardin (1643–1713) spent several years in Persia between 1669 and 1677. His account of his travels proved popular and was quickly translated into English.

■ [Shah Abbas] was a just and equitable prince, and all his endeavors had this one tendency, to render the kingdom flourishing and his people happy. He found his empire all torn to pieces and usurped, and the greatest part of it impoverished and pillaged. But it is scarce to be believed, what effect his good government had, throughout his dominions. To give the reader but barely one single instance of it; he brought into the capital city a colony of Armenians, who were a laborious and industrious people, and had nothing in the world when they came there; but in the space of thirty years they grew so exceeding rich, that there were above threescore merchants among them, who, one with another, were worth from an hundred thousand crowns, to two millions, in money and merchandize.

4 **John Fryer, an English physician's travels in Persia and India, 1681.** John Fryer (ca. 1650–1733) was a surgeon for the British East India Company. His account of his travels included information on natural history as well as social customs.

■ The Armenians being skilled in all the intricacies and subtleties of trade at home, and travelling with these into the remotest kingdoms, become by their own industry, and by being factors of their own kindred's honesty, the wealthiest men, being expert at bargains wherever they come, evading thereby brokerage; and studying all the arts of thrift, will travel for fifty shillings, where we cannot for fifty thomands. . . . From such beginnings do they raise sometimes great fortunes for themselves and masters. . . .

For so it was provided by Shah Abbas when he deprived them of their own princes, and redeemed them from the Turkish slavery; between whose arms and the Persians, they hung miserably harassed, according to the successes of either's forces, for a long time; removing them from Erevan, Tabriz, and Syria, their native soil, . . . by which they became not only safe from their enemies, but they improved the glory of Isfahan by their unwearied industry, there being many of them credible merchants at this time, accounted worth an hundred thousand thomand (each thomand being three pound and a noble); so mightily do they increase under this umbrage, in riches and freedom; for whilst they sit lazily at home, their factors abroad in all parts of the earth return to their hives laden with honey. . . .

They have sumptuous houses, enriched either by being merchants, or interpreters to foreign ministers, they being addicted to learn languages; few care for manual arts, or mechanic trades, though some apply themselves to husbandry.

5 **A throne given to the Russian tsar.** When merchants in the Armenian Trading Company petitioned the Russian tsar for tax-exempt status in 1659, they presented this heavily bejeweled throne as a gift.

ANALYZING THE EVIDENCE

1. Based on Sources 1 and 2, do you think it is plausible that Persian merchants complained to Shah Abbas that he was treating the Armenians too well?
2. Based on Sources 1–4, how well did the Armenian merchants adjust to their new circumstances? Do these texts give evidence of any continuing grievances?
3. Chardin (Source 3) and Fryer (Source 4) were in Persia in much the same period.

What might account for their rather different understandings of the relations between the Safavid rulers and the Armenian merchants?

4. Why would Armenian merchants give the Russian tsar a gift as expensive as the throne in Source 5?

PUTTING IT ALL TOGETHER

Using the sources above, along with what you have learned in class and in this chapter, write a short essay that examines the experiences of the deported Armenians, perhaps comparing their experiences to those of other communities forced to leave their homes in earlier or later times (such as the Israelites in the ancient Middle East or the Cherokees and other Native Americans in North America).

Shifting Trade Routes and European Penetration

How were the Islamic empires affected by the gradual shift toward trade routes that bypassed their lands?

It has widely been thought that a decline in the wealth and international importance of the Muslim empires could be directly attributed to the long-term shift in trading patterns that resulted from the discoveries of Columbus, Magellan, and other European explorers. The argument is that new sea routes enabled Europeans to acquire goods from the East without using Muslim intermediaries, so that the creation of European colonial powers beginning in the sixteenth century led directly and indirectly to the eclipse of the Ottomans, Safavids, and Mughals. Recent scholars have challenged these ideas as too simplistic. First, it was not until the eighteenth century that political decline became evident in the three Islamic empires. Second, Turkish, Persian, and Indian merchants remained very active as long-distance traders into the eighteenth century and opened up many new routes themselves. It is true that in the Islamic empires New World crops like potatoes and sweet potatoes fueled population increases less rapidly than in western Europe and East Asia. By 1800 the population of India was about 190 million, that of Safavid lands about 8 million, and that of Ottoman lands about 24 million. (By comparison, China's population stood at about 300 million in 1800 and Russia's about 35 million.)

European Rivalry for Trade in the Indian Ocean

Shortly before Babur's invasion of India, the Portuguese had opened the subcontinent to Portuguese trade. In 1510 they established the port of Goa on the west coast of India as their headquarters and through an aggressive policy took control of Muslim shipping in the Indian Ocean and Arabian Sea, charging high fees to let ships through. The Portuguese historian Barrões attempted to justify Portugal's seizure of commercial traffic that the Muslims had long dominated:

> It is true that there does exist a common right to all to navigate the seas and in Europe we recognize the rights which others hold against us; but the right does not extend beyond Europe and therefore the Portuguese as Lords of the Sea are justified in confiscating the goods of all those who navigate the seas without their permission.[4]

In short, the Portuguese decided that Western principles of international law should not restrict them in Asia. As a result, they controlled the spice trade over the Indian Ocean for almost a century.

In 1602 the Dutch formed the Dutch East India Company with the stated goal of wresting the enormously lucrative spice trade from the Portuguese. In 1685 they supplanted the Portuguese in Ceylon (Sri Lanka). The scent of fabulous profits also attracted the English. With a charter signed by Queen Elizabeth, eighty London merchants organized the British East India Company. In 1619 Emperor Jahangir granted a British mission important commercial concessions. Soon, by offering gifts, medical services, and bribes to Indian rulers, the British East India Company was able to set up twenty-eight coastal forts/trading posts. By 1700 the company had founded the cities that became Madras and Calcutta (today called Chennai and Kolkata) and had taken over Bombay (today Mumbai), which had been a Portuguese possession (Map 17.3).

MAP 17.3 **India, 1707–1805** In the eighteenth century Mughal power gradually yielded to the Hindu Marathas and to the British East India Company.

The British called their trading posts factory-forts. The term *factory* did not signify manufacturing; it designated the walled compound containing the residences, gardens, and offices of British East India

Company officials and the warehouses where goods were stored before being shipped to Europe. The company president exercised political authority over all residents.

Factory-forts existed to make profits from Asian-European trade, which was robust due to the popularity of Indian and Chinese wares in Europe in the late seventeenth and early eighteenth centuries. The European middle classes wanted Indian textiles, which were colorful, durable, cheap, and washable. The upper classes desired Chinese wallpaper and porcelains and Indian silks and cottons. Other Indian goods in demand included pepper and other spices, sugar, and opium. To pay for these goods, the British East India Company sold silver, copper, zinc, lead, and fabrics to the Indians. Profits grew even larger after 1700, when the company began to trade with China.

Merchant Networks in the Islamic Empires

The shifting trade patterns associated with European colonial expansion brought no direct benefit to the Ottomans and the Safavids, whose merchants could now be bypassed by Europeans seeking goods from India, Southeast Asia, or China. Yet merchants from these Islamic empires often proved adaptable, finding ways to benefit from the new trade networks.

In the case of India, the appearance of European traders led to a rapid increase in overall trade, helping Indian merchants and the Indian economy. Some Indian merchants in Calcutta and Bombay, for instance, made gigantic fortunes from trade within Asia carried on European ships. Block-printed cotton cloth, produced by artisans working at home, was India’s chief export.

English Dress Made of Indian Printed Cotton Cloth Early British traders in India were impressed with the quality of the textiles made there and began ordering designs that would be popular with the English. This dress, created around 1770–1780 in England, is made of printed cotton (chintz) from the southeastern part of India. Chintz became so popular in England that it was eventually banned because it was threatening local textile industries.

Within India the demand for cotton cloth, as well as for food crops, was so great that Akbar had to launch a wide-scale road-building campaign. From the Indian region of Gujarat, Indian merchant bankers shipped their cloth worldwide: across the Indian Ocean to Aden and the Muslim-controlled cities on the east coast of Africa; across the Arabian Sea to Muscat and Hormuz and up the Persian Gulf to the cities of Persia; up the Red Sea to the Mediterranean; by sea also to Malacca, Indonesia, China, and Japan; by land across Africa to Ghana on the west coast; and to

Astrakhan, Poland, Moscow, and even the Russian cities on the distant Volga River. Indian businessmen had branch offices in many of these places, and all this activity produced fabulous wealth for some Indian merchants. Indian merchants were often devout Hindus, Muslims, Buddhists, or Jains, evidence that undermines the argument of some Western writers, notably Karl Marx (see “The Birth of Socialism” in Chapter 24), that religion retarded Asia’s economic development.

Throughout Muslim lands both Jews and Christians were active in commerce. A particularly interesting case involves the Armenian Christians in the sixteenth to eighteenth centuries. Armenian merchants had been trading from their base in Armenia for centuries and were especially known for their trade in Persian silk. When the Portuguese first appeared on the western coast of India in 1498 and began to settle in south India, they found many Armenian merchant communities already there. A few decades later Akbar invited Armenians to settle in his new capital, Agra. In 1603 Shah Abbas captured much of Armenia, taking it from the Ottomans, and forcing the Armenians to move more deeply into Persia. (See “Thinking Like a Historian: Forced Relocation of Armenians to Persia,” page 486.)

Armenian merchant networks stretched from Venice and Amsterdam in western Europe, Moscow in Russia, and Ottoman-controlled Aleppo and Smyrna to all the major trading cities of India and even regions farther east, including Guangzhou in southern China and Manila in the Philippines. Many Armenian communities in these cities became quite substantial, built churches, and recruited priests. The merchant about to take a journey would borrow a sum of money to purchase goods and would contract to pay it back with interest on his return. Using couriers, these Armenian merchants sent long letters describing the trade environment and the prices that could be realized for given goods.

From the British East India Company to the British Empire in India

Britain’s presence in India began with the British East India Company and its desire to profit from trade. Managers of the company in London discouraged all unnecessary expenses and financial risks and thus opposed missionary activities or interference in local Indian politics. Nevertheless, the company responded to political instability in India in the early eighteenth century by extending political control. When warlords appeared or an uprising occurred, people from the surrounding countryside flocked into the company’s factory-forts, which gradually came to exercise political authority over the territories around them. The company’s factories evolved into defensive installations manned by small garrisons of native troops — known as **sepoys** — trained in Western military weapons and tactics.

sepoys The native Indian troops who were trained as infantrymen.

Britain eventually became the dominant foreign presence in India, despite challenges from the French. From 1740 to 1763 Britain and France were engaged in a tremendous global struggle, and India, like North America in the Seven Years' War (see Chapter 22), became a battlefield and a prize. The French won land battles, but English sea power proved decisive by preventing the landing of French reinforcements. The Treaty of Paris of 1763 recognized British control of much of India, marking the beginning of the British Empire in India.

How was Britain to govern so large a territory? Eventually, the East India Company was pushed out of its governing role because the English Parliament distrusted the company, believing it was corrupt. The Regulating Act of 1773 created the office of governor general to exercise political authority over the territory controlled by the company. The East India Company Act of 1784 required that the governor general be chosen from outside the company, and it made company directors subject to parliamentary supervision.

Implementation of these reforms fell to three successive governors: Warren Hastings (r. 1774–1785), Lord Charles Cornwallis (r. 1786–1794), and the marquess Richard Wellesley (r. 1797–1805). Hastings sought allies among Indian princes, laid the foundations for the first Indian civil service, abolished tolls to facilitate internal trade, placed the salt and opium trades under government control, and planned a codification of Muslim and Hindu laws. Cornwallis introduced the British style of property relations, in which the rents of tenant farmers supported the landlords. Wellesley was victorious over local rulers who resisted British rule, vastly extending British influence in India. Like most nineteenth-century British governors of India, Wellesley believed that British rule strongly benefited the Indians. With supreme condescension, he wrote that British power should be established over the Indian princes in order "to deprive them of the means of prosecuting any measure or of forming any confederacy hazardous to the security of the British empire, and to enable us to preserve the tranquility of India by exercising a general control over the restless spirit of ambition and violence which is characteristic of every Asiatic government."[5]

Political Decline

What common factors led to the decline of central power in the Islamic empires in the seventeenth and eighteenth centuries?

By the end of the eighteenth century all three of the major Islamic empires were on the defensive and losing territory (Map 17.4). They faced some common problems — succession difficulties, financial strain, and loss of military superiority — but their circumstances differed in significant ways as well.

MAP 17.4 The Muslim World, ca. 1700 The three great Islamic empires were adjacent to each other and of similar physical size. Many of their other neighbors were Muslim as well.

The first to fall was the Safavid Empire. Persia did not have the revenue base to maintain the sort of standing armies that the Ottomans and the Mughals had. Decline in the strength of the army encouraged increased foreign aggression. In 1722 the Afghans invaded from the east, seized Isfahan, and were able to repulse an Ottoman invasion from the west. In Isfahan thousands of officials and members of the shah's family were executed. In the following century no leaders emerged capable of reuniting all of Persia. In this political vacuum, Shi'a religious institutions grew stronger.

The Ottoman Empire also suffered from poor leadership. Early Ottoman practice had guaranteed that the sultans would be forceful men. The sultan's sons gained administrative experience as governors of provinces and military experience on the battlefield as part of their education. After the sultan died, any son who wanted to succeed had to contest his brothers to claim the throne, after which the new sultan would have his defeated brothers executed. Although bloody, this system led to the succession of capable, determined men. After Suleiman's reign, however, the tradition was abandoned. To prevent threats of usurpation, sons of the sultan were brought up in the harem, confined there as adults, and denied roles in government. The result was a series of rulers who were minor children or incompetent adults, leaving power in the hands of high officials and the mothers of the heirs. Political factions formed around viziers, military leaders, and palace women. In the contest for political favor, the devshirme was abandoned, and political and military ranks were filled by Muslims.

The Ottoman Empire's military strength also declined. The defeat of the Turkish fleet by the Spanish off the coast of Greece at Lepanto in 1571 marked the loss of Ottoman dominance in the Mediterranean. By the terms of a peace treaty with Austria signed at Karlowitz (1699), the Ottomans lost the major European provinces of Hungary and Transylvania, along with the tax revenues they had provided. Also, the Ottoman armies were depending more on mercenaries, and they did not keep up with the innovations in drill, command, and control that were then transforming European armies. From the late seventeenth century Ottoman armies began losing wars and territory along both northern and eastern borders. In 1774 the empire lost the lands on the northern bank of the Black Sea to Russia. In North Africa the local governors came to act more independently, sometimes starting hereditary dynasties.

In Mughal India the old Turkish practice of letting heirs fight for the throne persisted, leading to frequent struggles over succession, but also to strong rulers. Yet military challenges proved daunting there as well. After defeating his father and brothers, Aurangzeb made it his goal to conquer the south. The stiffest opposition came from the Marathas, a militant Hindu group centered in the western Deccan. From 1681 until his death in 1707, Aurangzeb led repeated sorties through the Deccan. He took many forts and won several battles, but total destruction of the Maratha guerrilla bands eluded him.

Aurangzeb’s death led to thirteen years of succession struggles, shattering the empire. His eighteenth-century successors were less successful than the Ottomans in making the dynasty the focus of loyalty. Mughal provincial governors began to rule independently, giving only minimal allegiance to the throne at Delhi. Meanwhile, the Marathas pressed steadily northward, constituting the gravest threat to Mughal authority. Threats also came from the west. In 1739 the Persian adventurer Nadir Shah invaded India, defeated the Mughal army, looted Delhi, and, after a savage massacre, carried off a huge amount of treasure, including the Peacock Throne. Constant skirmishes between the Afghans and the Marathas for control of the Punjab and northern India ended in 1761 at Panipat, where the Marathas were crushed by the Afghans. At that point, India no longer had a state strong enough to impose order on the subcontinent or check the penetration of the Europeans. Not until 1857, however, did the Mughal Dynasty come to a formal end.

In all three empires fiscal difficulties contributed to strain on the state. A long period of peace in the late sixteenth century and again in the mid-eighteenth century, as well as a decline in the frequency of visits of the plague, led to a doubling of the population. Increased population, coupled with the “little ice age” of the mid-seventeenth century, meant that the land could not sustain so many people, nor could the towns provide jobs for the thousands of agricultural workers who fled to them. The return of demobilized soldiers aggravated the problem. Inflation, famine, and widespread uprisings resulted. Power was seized by local notables and military strongmen at the expense of central government officials.

Chapter Summary

After the decline of the Mongols in Central Asia and Persia, many small Turkic-ruled states emerged in the region from Anatolia through Afghanistan. Three of them went on to establish large empires: the Ottomans in Anatolia, the Safavids in Persia, and the Mughals in India. The Ottoman Empire's political system reached its classic form under Suleiman I. All authority flowed from the sultan to his public servants: provincial governors, police officers, military generals, heads of treasuries, and viziers. In Persia for some time Turkish lords competed for power, with no single one dominant until 1501, when a fourteen-year-old military leader declared himself shah. The strength of this Safavid state rested in part on the skills of urban bureaucrats, who were vital to the civil machinery of government. Babur, from his base in Afghanistan, founded the Mughal Empire in India. His grandson Akbar extended Mughal rule far into India. Whereas the Ottoman sultans and Safavid shahs used slaves acquired from non-Muslim lands for military and administrative positions, Akbar relied on the services of royal princes, nobles, and warrior-aristocrats. All three empires quickly adapted to new gunpowder technologies.

Each of the three Islamic empires presided over an extraordinary artistic and intellectual flowering in everything from carpetmaking and book illustration to architecture and gardening, from geography and astronomy to medicine. Each of these empires drew legitimacy from its support for Islam. There were, however, key differences: the Ottomans and Mughals supported the Sunni tradition, the Safavids the Shi'a tradition.

The three Islamic empires all had a substantial number of non-Muslim subjects. The Ottomans ruled over the Balkans, where most of the people were Christian, and Muslims in India were greatly outnumbered by Hindus.

European exploration opened new trade routes and enabled Europeans to trade directly with India and China, bypassing Muslim intermediaries in the Middle East. Within India British merchants increased their political control in politically unstable areas, leading before the end of the eighteenth century to a vast colonial empire in India.

By the end of the eighteenth century all three of the major Islamic empires were losing territory. The first to fall was the Safavid Empire. From the late seventeenth century Ottoman armies began losing wars along the northern and eastern borders, resulting in substantial loss of territory. Military challenges proved daunting in Mughal India as well. In all three empires, as central power declined, local notables and military strongmen seized power.

CONNECTIONS

From 1300 to 1800 and from North Africa to India, Islamic civilization thrived under three dynastic houses: the Ottomans, the Safavids, and the Mughals. All three empires had a period of expansion when territory was enlarged, followed by a high point politically and culturally, and later a period of contraction, when territories broke away. Two of the empires had large non-Muslim populations. India, even under Mughal rule, remained a predominantly Hindu land, and the Ottomans, in the process of conquering the Balkans, acquired a population that was largely Greek Orthodox Christians. Though all three states supported Islam, the Safavids took Shi'a teachings as orthodox, while the other two favored Sunni teachings. At the cultural level, the borders of these three states were porous, and people, ideas, art motifs, languages, and trade flowed back and forth.

In East Asia the fifteenth through eighteenth centuries also saw the creation of strong, prosperous, and expanding states, though in the case of China (under the Qing Dynasty) and Japan (under the Tokugawa Shogunate) the eighteenth century was a cultural high point, not a period of decline. The Qing emperors were Manchus, from the region northeast of China proper, reminiscent of the Mughals, who began in Afghanistan. As in the Islamic lands, during these centuries the presence of European powers became an issue in East Asia, though the details were quite different. Although one of the commodities that the British most wanted was the tea produced in China, Britain did not extend political control in China the way it did in India. Japan managed to refuse entry to most European traders after finding their presence and their support for missionary activity disturbing. Chapter 21 takes up these developments in East Asia.

In the next three chapters the focus is on two other regions of the world, Europe and Africa. To fully understand what Britain was doing in India requires more background on what was happening in Europe from 1500 to 1800, a period when religious differences were causing strife between European states that were at the same time beginning to build overseas empires. By the eighteenth century the Scientific Revolution and the Enlightenment were having a major impact on people's lives in Europe, and the slave trade was tying Europe to both Africa and the Americas.

Review the Main Ideas

Answer the focus questions from each section of the chapter.

1. How were the three Islamic empires established, and what sorts of governments did they set up? (p. 470)
2. What cultural advances occurred under the rule of the Ottoman, Safavid, and Mughal Empires? (p. 478)
3. How did Christians, Jews, Hindus, and other non-Muslims fare under these Islamic states? (p. 484)
4. How were the Islamic empires affected by the gradual shift toward trade routes that bypassed their lands? (p. 488)
5. What common factors led to the decline of central power in the Islamic empires in the seventeenth and eighteenth centuries? (p. 492)

Make Comparisons and Connections

Analyze the larger developments and continuities within and across chapters.

1. In what sense were the states of the Ottomans, Safavids, and Mughals empires rather than large states? Do all three equally deserve the term “empire”? Why or why not?
2. How did the expansion of European presence in the Indian Ocean after 1450 impinge on the societies and economies of each of the Islamic empires?

3. What made it possible for Islamic rulers to tolerate more religious difference than European Christian rulers of the same period did (Chapters 14 and 15)?

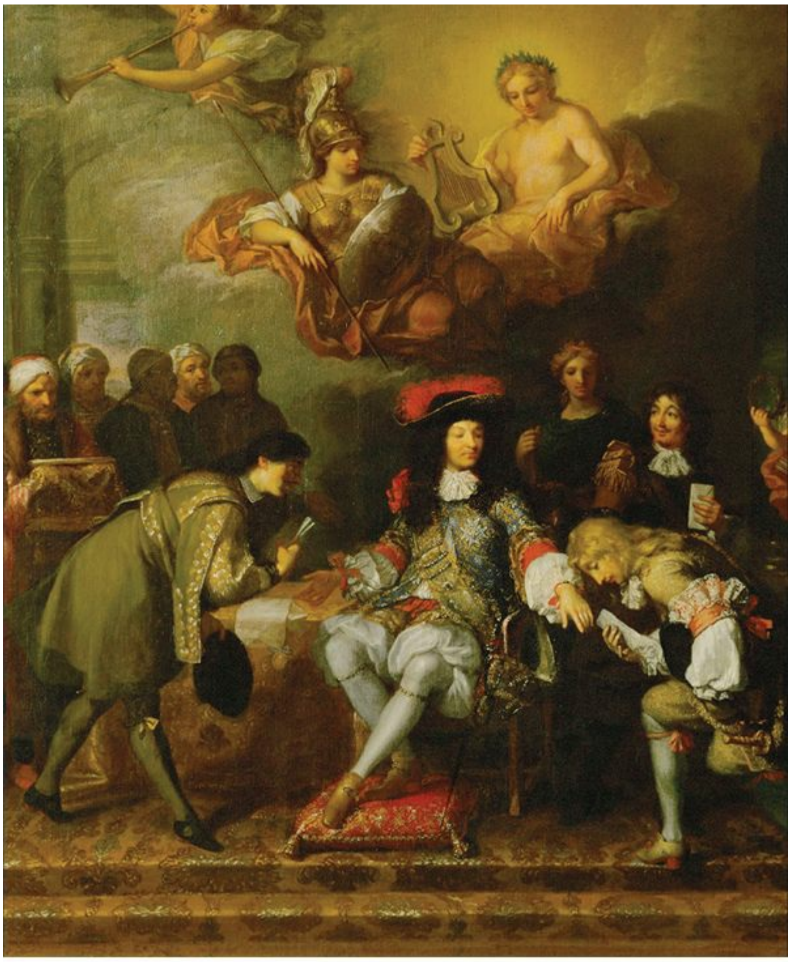
European Power and Expansion

1500–1750



Peace Treaty of Nijmegen, 1678/Museum of Fine Arts, Budapest, Hungary/Erich Lessing/Art Resource, NY

Louis XIV

In this painting, King Louis XIV receives foreign ambassadors to celebrate a peace treaty. The king grandly occupied the center of his court, which in

turn served as the pinnacle for the French people and, at the height of his glory, for all of Europe.

The two centuries that opened the early modern era witnessed crisis and transformation in Europe. What one historian has described as the long European "struggle for stability" originated with conflicts sparked by the Protestant and Catholic Reformations in the early sixteenth century and continued with economic and social breakdown into the late seventeenth century.[1] To consolidate their authority and expand their territories, European rulers increased the size of their armies, imposed higher taxes, and implemented bureaucratic forms of government. By the end of the seventeenth century they had largely succeeded in restoring order and securing increased power for the state.

The growth of state power within Europe raised a series of questions: Who held supreme power? What made it legitimate? Conflicts over these questions led to rebellions and at times outright civil war. Between roughly 1589 and 1715 two basic patterns of government emerged from these conflicts: absolute monarchy and the constitutional state. Almost all subsequent European governments were modeled on one of these patterns, which have also greatly influenced the rest of the world.

Whether a government was constitutional or absolutist, an important foundation of state power was empire and colonialism. Jealous of the riches and prestige the Iberian powers gained from their overseas holdings, England, France, and the Netherlands vied for territory in Asia and the Americas, while Russia pushed its borders east to the Pacific and west into central Europe. This was a distinctive moment in world history when exchange within and among empires produced constant movement of people, goods, and culture, with no one region or empire able to dominate the others entirely.

The Protestant and Catholic Reformations

How did the Protestant and Catholic Reformations change power structures in Europe and shape European colonial expansion?

As a result of a movement of religious reform known as the **Protestant Reformation**, Western Christendom broke into many divisions in the sixteenth century. This splintering happened not only for religious reasons but also because of political and social factors. Religious transformation provided a source of power for many rulers and shaped European colonial expansion.

Protestant Reformation A religious reform movement that began in the early sixteenth century and split the Western Christian Church.

The Protestant Reformation

In early-sixteenth-century western Europe, calls for reform in the church came from many quarters, both within and outside the church. Critics of the church concentrated their attacks on clerical immorality, ignorance, and absenteeism. Charges of immorality were aimed at a number of priests who were drunkards, neglected the rule of celibacy, gambled, or indulged in fancy dress. Charges of ignorance applied to barely literate priests who delivered poor-quality sermons.

In regard to absenteeism, many clerics, especially higher ecclesiastics, held several benefices (offices) simultaneously. However, they seldom visited the communities served by the benefices. Instead they collected revenues from all the benefices assigned to them and hired a poor priest to fulfill their spiritual duties.

There was also local resentment of clerical privileges and immunities. Priests, monks, and nuns were exempt from civic responsibilities, such as defending the city and paying taxes. Yet religious orders frequently held large amounts of urban property. City governments were increasingly determined to integrate the clergy into civic life. This brought city leaders into opposition with bishops and the papacy, which for centuries had stressed the independence of the church from lay control.

This range of complaints helps explain why the ideas of Martin Luther (1483–1546), a priest and professor of theology from the German University of Wittenberg, found a ready audience. Luther and other Protestants — the word comes from a “protest” drawn up by a group of reforming princes in 1529 — developed a new understanding of Christian doctrine in which salvation came through God’s grace by faith alone and religious authority rested solely in the Bible. These ideas directly contradicted the teachings of the Catholic Church, but they were attractive to educated people and urban residents, and they spread rapidly through preaching, hymns, and the printing press.

Domestic Scene The Protestant notion that the best form of Christian life was marriage and a family helps explain the appeal of Protestantism to middle-class urban men and women, such as those shown in this domestic scene. The large covered bed at the back was both a standard piece of furniture in urban homes and a symbol of proper marital sexual relations.

Luther lived in the Holy Roman Empire, a loose collection of largely independent states in which the emperor had far less authority than did the monarchs of western Europe. The Habsburg emperor, Charles V, was a staunch supporter of Catholicism, but the ruler of the territory in which Luther lived protected the reformer. Although Luther appeared before Charles V when he was summoned, he was not arrested and continued to preach and write.

Luther’s ideas appealed to the local rulers of the empire for a variety of reasons. Though Germany was not a nation, people did have an understanding of being German because of their language and traditions. Luther frequently used the phrase “we Germans” in his attacks on the papacy, and his appeal to national feeling influenced many rulers. Also, while some German rulers were sincerely attracted to Lutheran ideas, material considerations swayed many others. The adoption of Protestantism would mean the legal confiscation of church properties. Thus many political authorities in the empire used the religious issue to extend their power and to enhance their independence from the emperor. Luther worked closely with political authorities, viewing them as fully justified in reforming the church in their territories. Thus, just as in the Ottoman and Safavid Empires, rulers drew their legitimacy in part from their support for religion. By 1530 many parts of the Holy Roman Empire and Scandinavia had broken with the Catholic Church.

In England the issue of the royal succession triggered that country's break with Rome, and a Protestant Church was established during the 1530s under King Henry VIII (r. 1509–1547) and reaffirmed under his daughter Elizabeth I (r. 1558–1603). Church officials were required to sign an oath of loyalty to the monarch, and people were required to attend services at the state church, which became known as the Anglican Church.

Protestant ideas also spread into France, the Netherlands, Scotland, and eastern Europe. In all these areas, a second generation of reformers built on earlier ideas to develop their own theology and plans for institutional change. The most important of the second-generation reformers was the Frenchman John Calvin (1509–1564), who reformed the city of Geneva, Switzerland. Calvin believed that God was absolutely sovereign and omnipotent and that humans had no free will. Thus men and women could not actively work to achieve salvation, because God had decided at the beginning of time who would be saved and who damned, a theological principle called predestination.

The church in Geneva served as the model for the Presbyterian Church in Scotland, the Huguenot (HYOO-guh-naht) Church in France, and the Puritan Churches in England and New England. Calvinism became the compelling force in international Protestantism, first in Europe and then in many Dutch and English colonies around the world. Calvinism was also the dominant form of Protestantism in France (Map 18.1).

MAP 18.1 Religious Divisions, ca. 1555 In the mid-sixteenth century, much of Europe remained Catholic. The Peace of Augsburg (1555) allowed the ruler of each territory in the Holy Roman Empire to determine the religion of its people. The northern territories of the empire became Lutheran, as did Scandinavia, while much of the southern empire remained Catholic. Sizable Calvinist populations existed in Scotland, the Netherlands, and central Europe. Eastern Europe was dominated by Orthodox Christianity, and the Ottoman Empire to the south and southeast was Muslim.

The Catholic Reformation

In response to the Protestant Reformation, by the 1530s the papacy was leading a movement for reform within the Roman Catholic Church. Many historians see the developments within the Catholic Church after the Protestant Reformation as two interrelated movements, one a drive for internal reform linked to earlier reform efforts and the other a Counter-Reformation that opposed Protestantism spiritually, politically, and militarily.

Pope Paul III (pontificate 1534–1549) established the Supreme Sacred Congregation of the Roman and Universal Inquisition, often called the Holy Office, with judicial authority over all Catholics and the power to imprison and execute. He also called a general council of the church, which met intermittently from 1545 to 1563 at the city of Trent. The Council of Trent laid a solid basis for the spiritual renewal of the Catholic Church. It gave equal validity to the Scriptures and to tradition as sources of religious truth and tackled problems that had disillusioned many Christians. Bishops were required to live in their dioceses and to establish a seminary for educating and training clergy. Finally, it placed great emphasis on preaching to and instructing the laity. For four centuries the Council of Trent served as the basis for Roman Catholic faith, organization, and practice.

Just as seminaries provided education, so did new religious orders, which aimed to raise the moral and intellectual level of the clergy and people. The Ursuline (UHR-suh-luhn) order of nuns, founded by Angela Merici (1474–1540), attained enormous prestige for its education of women.

Another important new order was the Society of Jesus, or **Jesuits**. Founded by Ignatius Loyola (1491–1556) in 1540, this order played a powerful international role in strengthening Catholicism in Europe and spreading the faith around the world. Recruited primarily from wealthy merchant and professional families, the Society of Jesus developed into a highly centralized organization. It established well-run schools to educate the sons of the nobility as well as the poor. The Jesuits achieved phenomenal success for the papacy and the reformed Catholic Church, carrying Christianity to South and Central America, India, and Japan before 1550 and to Brazil, North America, and the Congo in the seventeenth century. Also, as confessors and spiritual directors to kings, Jesuits exerted great political influence.

Religious Violence

Religious differences led to riots, civil wars, and international conflicts in Europe during the sixteenth century. In the Holy Roman Empire fighting began in 1546. The empire was a confederation of hundreds of principalities, independent cities, duchies, and other polities loosely united under an elected emperor. The initial success of Emperor Charles V led to French intervention on the side of the Protestants, lest the emperor acquire even more power. In 1555 Charles agreed to the Peace of Augsburg, which officially recognized Lutheranism and ended religious war in Germany for many decades. Under this treaty, the political authority in each territory of the Holy Roman Empire was permitted to decide whether the territory would be Catholic or Lutheran. His hope of uniting his empire under a single church dashed, Charles V abdicated in 1556, transferring power over his Spanish and Dutch holdings to his son Philip II and his imperial power to his brother Ferdinand.

In France armed clashes between Catholic royalists and Calvinist antiroyalists occurred in many parts of the country. A savage Catholic attack on Calvinists in Paris on August 24, 1572 — Saint Bartholomew's Day — occurred at the marriage of the king's sister Margaret of Valois to the Protestant Henry of Navarre. The Saint Bartholomew's Day massacre initiated a civil war that dragged on for fifteen years, destroying agriculture and commercial life in many areas.

In the Netherlands the movement for church reform developed into a struggle for Dutch independence. In the 1560s Spanish authorities attempted to suppress Calvinist worship and raised taxes. Civil war broke out from 1568 to 1578 between Catholics and Protestants in the Netherlands and between the provinces of the Netherlands and Spain. Eventually the ten southern provinces came under the control of the Spanish Habsburg forces. The seven northern provinces, led by Holland, formed the Union of Utrecht (United Provinces of the Netherlands) and in 1581 declared their independence from Spain. The north was Protestant, and the south remained Catholic. Hostilities continued until 1609, when Spain agreed to a truce that recognized the independence of the northern provinces.

The era of religious wars was also the time of the most extensive witch persecutions in European history, with between 100,000 and 200,000 people officially tried for witchcraft in the sixteenth and seventeenth centuries. Both Protestants and Catholics persecuted accused witches, with church officials and secular authorities acting together. The heightened sense of God's power and divine wrath in the Reformation era was an important factor in the witch-hunts, as were new demonological ideas, legal procedures involving torture, and neighborhood tensions. Though the gender balance of the accused varied widely in different parts of Europe, between 75 and 85 percent of those tried and executed were women, whom some demonologists viewed as weaker and so more likely to give in to the Devil.

Seventeenth-Century Crisis and Rebuilding

How did seventeenth-century European rulers overcome social and economic crisis to build strong states?

Historians often refer to the seventeenth century as an "age of crisis" because Europe was challenged by population losses, economic decline, and social and political unrest. These difficulties were partially due to climate changes that reduced agricultural productivity. But they also resulted from military competition among European powers, the religious divides of the Reformations, increased taxation, and war. Peasants and the urban poor were especially hard hit by the economic problems, and they frequently rioted against high food prices.

The atmosphere of crisis encouraged governments to take emergency measures to restore order, measures that they successfully turned into long-term reforms that strengthened the power of the state. In the long run, European states proved increasingly able to impose their will on the populace.

The Social Order and Peasant Life

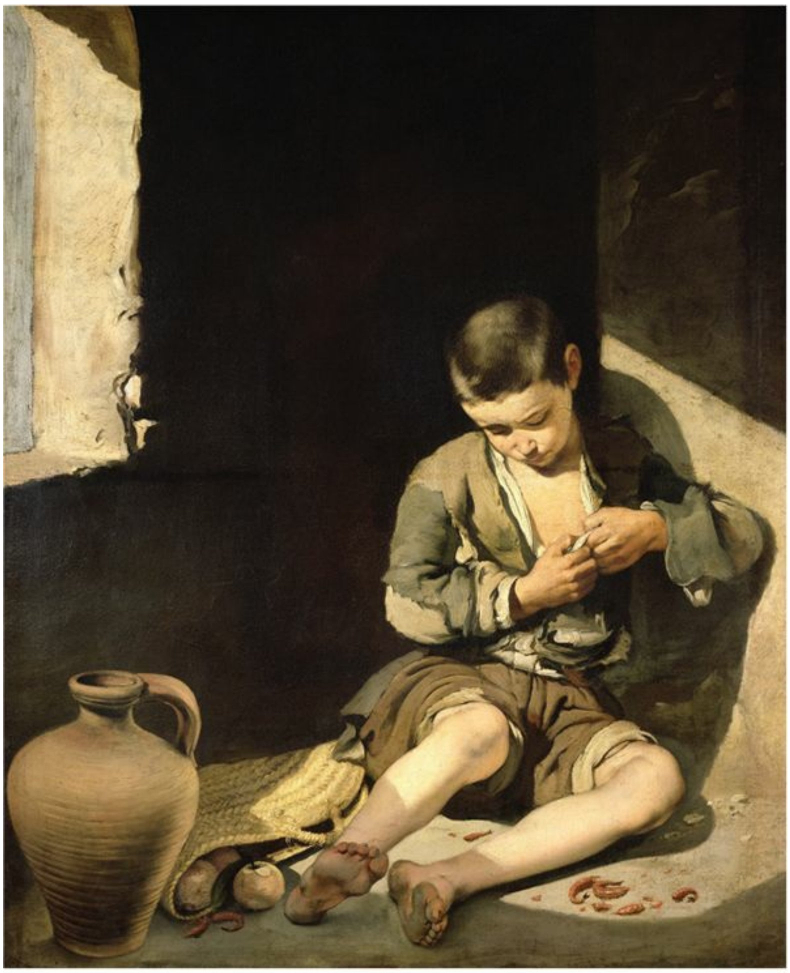
Peasants occupied the lower tiers of a society organized in hierarchical levels. In much of Europe, the monarch occupied the summit and was celebrated as a semidivine being chosen by God to embody the state. The clergy generally constituted the first order of society, due to its sacred role interceding with God on behalf of its flocks. Next came nobles, whose privileged status derived from their ancient bloodlines and leadership in battle. Many prosperous mercantile families had bought their way into the nobility through service to the monarchy in the fifteenth and sixteenth centuries, and they constituted a second tier of nobles. Those lower on the social scale, the peasants and artisans who formed the vast majority of the population, were expected to show deference to their betters. This was the "Great Chain of Being" that linked God to his creation in a series of ranked social groups.

In addition to being rigidly hierarchical, European societies were patriarchal. Religious and secular law commanded a man's wife, children, servants, and apprentices to respect and obey him. Fathers were entitled to use physical violence, imprisonment, and other forceful measures to impose their authority. These powers were balanced by expectations that a good father would care benevolently for his dependents.

In the seventeenth century the vast majority of Europeans lived in the countryside, as was the case in most parts of the world. In western Europe a small number of peasants owned enough land to feed themselves and possessed the livestock and plows necessary to work their land. Independent farmers were leaders of the peasant village. Below them were small landowners and tenant farmers who did not have enough land to be self-sufficient. At the bottom were villagers who worked as dependent laborers and servants. Private landowning among peasants was a distinguishing feature of western Europe. In central and eastern Europe the vast majority of peasants toiled as serfs for noble landowners, while in the Ottoman Empire all land belonged to the sultan.

Economic Crisis and Popular Revolts

In the seventeenth century a period of colder and more variable climate afflicted much of the globe. Dubbed the “little ice age” by historians, this period of cold weather accompanied by both too much rain and episodes of severe drought resulted in shorter growing seasons with lower yields. A bad harvest created food shortages; a series of bad harvests could lead to famine. Recurrent famines significantly diminished the population of Europe and Asia in this period, through reduced fertility, increased susceptibility to disease, and outright starvation.



Louvre, Paris, France/Bridgeman Images

The Young Beggar The mid-seventeenth century was a harsh period for many Europeans, who faced meager harvests, unemployment, high taxation, and social unrest.

Industry also suffered. In Europe the output of woolen textiles, the most important industrial sector, declined sharply. Food prices were high, wages stagnated, and unemployment soared. This economic crisis was not universal: it struck various regions at different times and to different degrees. In the middle decades of the century, for example, Spain, France, Germany, and the British Isles all experienced great economic difficulties, as did China, but these years were the golden age of the Netherlands (see "The Dutch Republic"). Japan also emerged relatively unscathed, as did South Asia and the Americas.

The urban poor and peasants were the hardest hit. When the price of bread rose beyond their capacity to pay, they frequently expressed their anger by rioting. Women often led these actions, since their role as mothers gave them some impunity in authorities' eyes. Historians have used the term **moral economy** for this vision of a world in which community needs predominate over competition and profit and in which necessary goods should thus be sold at a fair price.

moral economy The early modern European view that community needs predominated over competition and profit and that necessary goods should thus be sold at a fair price.

During the middle years of the seventeenth century, harsh conditions transformed neighborhood bread riots into armed uprisings across much of Europe. Popular revolts were common in England, France, and throughout the Spanish Empire, particularly during the 1640s. At the same time that he struggled to put down an uprising in Catalonia, the economic center of the realm, Spanish king Philip IV faced revolt in Portugal, the northern provinces of the Netherlands, and Spanish-occupied Sicily. France suffered an uprising in the same period that won enthusiastic support from both nobles and peasants, while the English monarch was tried and executed by his subjects and Russia experienced an explosive rebellion. In China a series of popular revolts culminated in the fall of the Ming empire in 1644, demonstrating the global reach of the seventeenth-century crisis.

Municipal and royal authorities struggled to overcome popular revolt in the mid-seventeenth century. They feared that stern repressive measures, such as sending in troops to fire on crowds, would create martyrs and further inflame the situation, while full-scale occupation of a city would be very expensive and detract from military efforts elsewhere. The limitations of royal authority gave some leverage to rebels. To quell riots, royal edicts were sometimes suspended, prisoners released, and discussions initiated. By the beginning of the eighteenth century rulers had gained much greater control over their populations, as a result of the achievements in state-building discussed below (see “European Achievements in State-Building”).

The Thirty Years’ War

In addition to harsh economic conditions, popular unrest was greatly exacerbated by the impact of the decades-long conflict known as the **Thirty Years’ War** (1618–1648), a war that drew in almost every European state. The background to the war was a shift in the balance between the population of Protestants and Catholics in the Holy Roman Empire that led to the deterioration of the Peace of Augsburg. Lutheran princes felt compelled to form the Protestant Union (1608), and Catholics retaliated with the Catholic League (1609). Dynastic interests were also involved; the Spanish Habsburgs strongly supported the goals of their Austrian relatives: the unity of the empire and the preservation of Catholicism within it.

Thirty Years' War A large-scale conflict extending from 1618 to 1648 that pitted Protestants against Catholics in central Europe, but also involved dynastic interests, notably of Spain and France.

The war began with a conflict in Bohemia (part of the present-day Czech Republic) between the Catholic League and the Protestant Union but soon spread through the Holy Roman Empire, drawing in combatants from across Europe. After a series of initial Catholic victories, the tide of the conflict turned due to the intervention of Sweden, under its king Gustavus Adolphus (r. 1594–1632), and then France, whose prime minister, Cardinal Richelieu (REESH-uh-lyuh), intervened on the side of the Protestants to undermine Habsburg power.

The 1648 Peace of Westphalia that ended the Thirty Years' War marked a turning point in European history. The treaties that established the peace not only ended conflicts fought over religious faith but also recognized the independent authority of more than three hundred German princes (Map 18.2), reconfirming the emperor's severely limited authority. The Augsburg agreement of 1555 became permanent, adding Calvinism to Catholicism and Lutheranism as legally permissible creeds. The United Provinces of the Netherlands, known as the Dutch Republic, won official freedom from Spain.

MAP 18.2 Europe After the Thirty Years' War Which country emerged from the Thirty Years' War as the strongest European power? What dynastic house was that country's major rival in the early modern period?

The Thirty Years' War was probably the most destructive event in central Europe prior to the world wars of the twentieth century. Perhaps one-third of urban residents and two-fifths of the rural population died, and agriculture and industry withered. Across Europe, states increased taxes to meet the cost of war, further increasing the suffering of a traumatized population.

European Achievements in State-Building

In this context of warfare, economic crisis, popular revolt, and demographic decline, rulers took urgent measures to restore order and rebuild their states. In some states, absolutist models of government prevailed. In others, constitutionalist forces dominated. Despite their political differences, all these states sought to protect and expand their frontiers, raise taxes, consolidate central control, establish social welfare programs, and compete for colonies and trade in the New and Old Worlds. In so doing, they followed a broad pattern of state-building and consolidation of power found across Eurasia in this period.

Rulers who wished to increase their authority encountered formidable obstacles, including poor communications, entrenched local power structures, and ethnic and linguistic diversity. Nonetheless, over the course of the seventeenth century both absolutist and constitutional governments achieved new levels of power and national unity. They did so by transforming emergency measures of wartime into permanent structures of government and by subduing privileged groups through the combined use of force and economic and social incentives. Increased state authority may be seen in four areas in particular: a tremendous growth in the size and professionalism of armies; much higher taxes; larger and more efficient bureaucracies; and territorial expansion both within Europe and overseas. A fifth important area of European state growth — government sponsorship of scientific inquiry — will be discussed in Chapter 19.

Over time, centralized power added up to something close to **sovereignty**. A state may be termed sovereign when it possesses a monopoly over the instruments of justice and the use of force within clearly defined boundaries. In a sovereign state, no nongovernmental system of courts competes with state courts in the dispensation of justice. Also, private armies present no threat to central authority. While seventeenth-century states did not acquire full sovereignty, they made important strides toward that goal.

sovereignty Authority of states that possess a monopoly over the instruments of justice and the use of force within clearly defined boundaries and in which private armies present no threat to central control; seventeenth-century European states made important advances toward sovereignty.

Absolutist States in Western and Central Europe

What was absolutism, and how did it evolve in seventeenth-century Spain, France, and Austria?

Rulers in absolutist states asserted that, because they were chosen by God, they were responsible to God alone. Under the rule of **absolutism**, monarchs claimed exclusive power to make and enforce laws, denying any other institution or group the authority to check their power. This system was limited in practice by the need to maintain legitimacy and compromise with elites. Spain, France, and Austria provide three key examples of the development of the absolutist state.

absolutism A political system common to early modern Europe in which monarchs claimed exclusive power to make and enforce laws, without checks by other institutions; this system was limited in practice by the need to maintain legitimacy and compromise with elites.

Spain

The discovery of silver at Potosí in 1545 had produced momentous wealth for Spain, allowing it to dominate Europe militarily (see “Spanish Silver and Its Economic Effects” in Chapter 16). Yet Spain had inherent weaknesses that the wealth of empire had hidden. When Philip IV took the throne in 1621, he inherited a vast and overstretched empire, which combined different kingdoms with their own traditions and loyalties. Spanish silver had created great wealth but also dependency. While Creoles undertook new industries in the colonies and European nations targeted Spanish colonial trade, industry and finance in Spain itself remained undeveloped.

Spain’s limitations became apparent during the first half of the seventeenth century. Between 1610 and 1650 Spanish trade with the colonies in the New World fell 60 percent due to competition from colonial industries and from Dutch and English traders. To make matters worse, in 1609 the Crown expelled some three hundred thousand Moriscos, or former Muslims, significantly reducing the pool of skilled workers and merchants. At the same time, disease decimated the enslaved workers who toiled in South American silver mines. Moreover, the mines started to run dry, and the quantity of metal produced steadily declined after 1620 and Dutch privateers seized the entire silver fleet in 1628.

In Madrid the expenses of war and imperial rule constantly exceeded income. Despite the efforts of Philip’s able chief minister, Gaspar de Guzmán, Count-Duke of Olivares, it proved impossible to force the kingdoms of the empire to shoulder the cost of its defense. To meet state debt, the Spanish crown repeatedly devalued the coinage and declared bankruptcy, which resulted in the collapse of national credit and steep inflation.

Spanish aristocrats, attempting to maintain an extravagant lifestyle they could no longer afford, increased the rents on their estates. High rents and heavy taxes drove the peasants from the land, leading to a decline in agricultural productivity. In cities wages and production stagnated. Spain also ignored new scientific methods that might have improved agricultural or manufacturing techniques because they came from the heretical nations of Holland and England.

The painter Velázquez has portrayed himself working on a canvas, while her parents, the king and queen of Spain, are reflected in the mirror behind the princess.

Spain’s situation worsened with internal rebellions and fresh military defeats during the Thirty Years’ War and the remainder of the seventeenth century. The Treaty of Westphalia, which ended the Thirty Years' War, compelled Spain to recognize the independence of the Dutch Republic, and another treaty in 1659 granted extensive territories to France. Finally, in 1688 the Spanish crown reluctantly recognized the independence of Portugal. With these losses, the era of Spanish dominance in Europe ended.

The Foundations of French Absolutism

Although France was the largest and most populous state in western Europe, its position at the beginning of the seventeenth century appeared extremely weak. Struggling to recover from decades of religious civil war, France posed little threat to Spain's predominance in Europe. By the end of the century the countries' positions were reversed.

Henry IV (r. 1589–1610) inaugurated the Bourbon dynasty, defusing religious tensions and rebuilding France's economy. He issued the Edict of Nantes in 1598, allowing Huguenots (French Protestants) the right to worship in 150 traditionally Protestant towns throughout France. He invested in infrastructure and raised revenue by selling royal offices instead of charging high taxes. Despite his efforts at peace, Henry was murdered in 1610 by a Catholic zealot.

Cardinal Richelieu (1585–1642) became first minister of the French crown on behalf of Henry's young son Louis XIII (r. 1610–1643). Richelieu designed his domestic policies to strengthen royal control. He extended the use of intendants, commissioners for each of France's thirty-two districts who were appointed by and were responsible to the monarch. By using the intendants to gather information and ensure royal edicts were enforced, Richelieu reduced the power of provincial nobles. Richelieu also viewed France's Huguenots as potential rebels, and he laid seige to La Rochelle, a Protestant stronghold. Richelieu's main foreign policy goal was to destroy the Habsburgs' grip on territories that surrounded France. Consequently, Richelieu supported Habsburg enemies, including Protestants, during the Thirty Years' War (see "The Thirty Years' War").

Cardinal Jules Mazarin (1602–1661) succeeded Richelieu as chief minister for the next child-king, the four-year-old Louis XIV, who inherited the throne from his father in 1643. Mazarin's struggle to increase royal revenues to meet the costs of the Thirty Years' War led to the uprisings of 1648–1653 known as the Fronde. In Paris magistrates of the Parlement of Paris, the nation's most important law court, were outraged by the Crown's autocratic measures. These so-called robe nobles (named for the robes they wore in court) encouraged violent protest by the common people. As rebellion spread outside Paris and to the sword nobles (the traditional warrior nobility), civil order broke down completely, and young Louis XIV had to flee Paris.

Much of the rebellion faded, however, when Louis XIV was declared king in his own right in 1651, ending the regency of his mother, Anne of Austria. The French people were desperate for peace and stability after the disorders of the Fronde and were willing to accept a strong monarch who could restore order. Louis pledged to do just that, insisting that only his absolute authority stood between the French people and a renewed descent into chaos.

Louis XIV and Absolutism

During the long reign of Louis XIV (r. 1643–1715), known as the Sun King, the French monarchy overcame weakness and division to become the most powerful nation in western Europe. Louis based his authority on the **divine right of kings**: God had established kings as his rulers on earth, and they were answerable ultimately to him alone. However, Louis also recognized that kings could not simply do as they pleased. They had to obey God's laws and rule for the good of the people.

divine right of kings The belief propagated by absolutist monarchs in Europe that they derived their power from God and were only answerable to him.

Like his counterpart, the Kangxi emperor of China, who inherited his realm only two decades after the Sun King did (see "Competent and Long-Lived Emperors" in Chapter 21), Louis XIV impressed his subjects with his discipline and hard work. (See "Global Viewpoints: Descriptions of Louis XIV of France and the Kangxi Emperor of China," at right.) He ruled his realm through several councils of state and insisted on taking a personal role in many of the councils' decisions. Despite increasing financial problems, Louis never called a meeting of the Estates General, the traditional French representative assembly composed of the three estates of clergy, nobility, and commoners. The nobility, therefore, had no means of united expression or action. To further restrict their political power, he excluded them from his councils and chose instead capable men of modest origins.

Although personally tolerant, Louis hated division. He insisted that religious unity was essential to the security of the state. In 1685 Louis revoked the Edict of Nantes. Around two hundred thousand Protestants, including some of the kingdom's most highly skilled artisans, fled France.

Louis's insistence on "one king, one law, one religion" contrasts sharply with the religious tolerance exhibited by Muslim empires in the Middle East and South Asia (see "Non-Muslims Under Muslim Rule" in Chapter 17).

Despite his claims to absolute authority, there were multiple constraints on Louis's power. As a representative of divine power, he was obliged to rule in a way that seemed consistent with virtue and paternal benevolence. He had to uphold the laws issued by his royal predecessors. Moreover, he also relied on the collaboration of nobles. Without their cooperation, it would have been impossible for Louis to extend his power throughout France or wage his many foreign wars. GLOBAL VIEWPOINTS

Descriptions of Louis XIV of France and the Kangxi Emperor of China

King Louis XIV of France (1638–1715) and the Kangxi emperor of Qing China (1654–1722) lived remarkably parallel lives. They both inherited realms in childhood and learned to rule from powerful women, in Louis's case his mother, Queen Anne of Austria, and in Kangxi's case his grandmother, Grand Empress Dowager Xiaozhuang. Both rulers built magnificent palaces and demonstrated hard work, discipline, and a thirst for glory and power. Louis sent Jesuits to the Chinese court to spread European scientific knowledge and Catholicism. The emperor originally welcomed them and was fascinated by their learning and technology, but he eventually banned them and Christianity from his realm. The following descriptions of Louis XIV and the Kangxi emperor, written by a French courtier and a Jesuit missionary, respectively, underline the similar qualities observers noted in the two rulers.

The Duke of Saint-Simon, *Memoirs of Louis XIV, His Court, and the Regency, 1739–1749*.

■ [He was] the very figure of a hero, so impregnated with a natural but most imposing majesty that it appeared even in his most insignificant gestures and movements, without arrogance but with simple gravity. . . . He was as dignified and majestic in his dressing gown as when dressed in robes of state, or on horseback at the head of his troops.

He excelled in all sorts of exercise and liked to have every facility for it. No fatigue nor stress of weather made any impression on that heroic figure and bearing; drenched with rain or snow, pierced with cold, bathed in sweat or covered with dust, he was always the same. . . .

[He had] the ability to speak well and to listen with quick comprehension; much reserve of manner adjusted with exactness to the quality of different persons; a courtesy always grave, always dignified, always distinguished, and suited to the age, rank, and sex of each individual, and, for the ladies, always an air of natural gallantry. . . .

Nothing could be regulated with greater exactitude than were his days and hours. In spite of all his variety of places, affairs, and amusements, with an almanac and a watch one might tell, three hundred leagues away, exactly what he was doing. . . . If he administered reproof, it was rarely, in few words, and never hastily. He did not lose control of himself ten times in his whole life, and then only with inferior persons, and not more than four or five times seriously.

Father Joachim Bouvet, *The History of Cang-Hy, the Present Emperour of China, 1699*

■ His whole Deportment is very Majestick, being well proportion'd in his

Limbs, and pretty Tall, the Feature of his Face very exact, with a large and brisk Eye, beyond what is observable among others of that Nation; He is a little crooked Nosed, and pitted with the Small-pox, but not so as to be in the least disfigur'd by them.

But the rare Accomplishments of his Mind, surpass infinitely those of his Body. His Natural Genius is such as can be parallel'd but by few, being endow'd with a Quick and piercing Wit, a vast Memory, and Great Understanding; His Constancy is never to be shaken by any sinister Event, which makes him the fittest Person in the World, not only to undertake, but also to accomplish Great Designs.

To be short, his inclinations are so Noble, and in all respects so Answerable to the High Station of so Great a Prince, that his People stand in Admiration of his Person, being equally Charm'd with his Love and Justice, and the Tenderness he shews for his Subjects, and with his virtuous Inclinations; which as they are always guided by the Dictates of Reason, so, they render him an Absolute Master of his Passions.

QUESTIONS FOR ANALYSIS

1. What qualities did the Duke of Saint-Simon and Father Bouvet admire in Louis XIV and the Kangxi emperor? What similarities do you find among the qualities they describe?
2. Based on what you have read in this chapter, why was it important for an absolute ruler to possess the qualities the authors describe? What weaknesses do these excerpts suggest a would-be ruler should avoid, and why?

THINKING LIKE A HISTORIAN

What Was Absolutism?

Historians have long debated the nature of "absolutism" in seventeenth-century Europe. While many historians have emphasized the growth of state power in this period, especially under Louis XIV of France, others have questioned whether such a thing as "absolutism" ever existed. The following documents will allow you to draw your own conclusions about absolutism.

1 **Jacques-Bénigne Bossuet, political treatise, 1709.** In 1670 Louis XIV appointed Bishop Bossuet tutor to his son and heir, known as the dauphin. In *Politics Drawn from the Very Words of Holy Scripture,* Bossuet argued that royal power was divine and absolute, but not without limits.

■ It appears from all this that the person of the king is sacred, and that to attack him in any way is sacrilege. God has the kings anointed by his prophets with the holy unction in like manner as he has bishops and altars anointed. But even without the external application in thus being anointed, they are by their very office the representatives of the divine majesty deputed by Providence for the execution of his purposes. Accordingly God calls Cyrus his anointed. "Thus saith the Lord to his anointed, to Cyrus, whose right hand I have holden, to subdue nations before him." Kings should be guarded as holy things, and whosoever neglects to protect them is worthy of death. . . . There is something religious in the respect accorded to a prince. The service of God and the respect for kings are bound together. St. Peter unites these two duties when he says, "Fear God. Honour the king.". . . But kings, although their power comes from on high, as has been said, should not regard themselves as masters of that power to use it at their pleasure; . . . they must employ it with fear and self-restraint, as a thing coming from God and of which God will demand an account.

2 **Letter of the prince of Condé, royal governor of the province of Burgundy, to Controller General Jean-Baptiste Colbert, June 18, 1662.** In this letter, the king's representative in the province of Burgundy reports on his efforts to compel the leaders of the province to pay taxes levied by the royal government. The Estates of Burgundy comprised representatives of the three orders, or estates, of society: the clergy, the nobility, and the commoners.

■ Since then the Estates have deliberated every day, persuaded that the extreme misery in this province — caused by the great levies it has suffered, the sterility [of the land] in recent years, and the disorders that have recently occurred — would induce the king to give them some relief. That is why they offered only 500,000 for the free gift. Then, after I had protested this in the appropriate manner, they raised it to 600,000, then 800,000, and finally 900,000 livres. Until then I had stood firm at 1.5 million, but when I saw that they were on the verge of deciding not to give any more . . . I finally came down to the 1.2 million livres contained in my instructions and invited them to deliberate again, declaring that I could not agree to present any other proposition to the king and that I believed that there was no better way to serve their interests than to obey the king blindly. They agreed with good grace and came this morning to offer me a million. They begged me to leave it at that and not to demand more from them for the free gift; and since I told them they would have to do a little better to satisfy the king completely on this occasion, they again exaggerated their poverty and begged me to inform the king of it, but said that, rather than not please him, they preferred to make a new effort, and they would leave it up to me to declare what they had to do. I told them that I believed His Majesty would have the goodness to be satisfied with 1.05 million livres for the free gift, and they agreed. . . . So Monsieur, there is the deed done.

3 **Louis XIV, *Memoir for the Instruction of the Dauphin.*** In 1670 Louis XIV finished a memoir he had compiled for the education of his son and heir. Presented in the king's voice — although cowritten with several royal aides — the memoir recounts the early years of Louis's reign and explains his approach to absolute rule.

■ For however it be held as a maxim that in every thing a Prince should employ the most mild measures and first, and that it is more to his advantage to govern his subjects by persuasive than coercive means, it is nevertheless certain that whenever he meets with impediments or rebellion, the interest of his crown and the welfare of his people demand that he should cause himself to be indispensably obeyed; for it must be acknowledged there is nothing can so securely establish the happiness and tranquility of a country as the perfect combination of all authority in the single person of the Sovereign. The least division in this respect often produces the greatest calamities; and whether it be detached into the hands of individuals or those of corporate bodies, it always is there in a state of fermentation.

. . . [B]esides the insurrections and the intestine commotions which the ambition of power infallibly produces when it is not repressed, there are still a thousand other evils created by the inactivity of the Sovereign. Those who are nearest his person are the first to observe his weakness, and are also the first who are desirous of profiting by it. Every one of those persons have necessarily others who are subservient to their avaricious views, and to whom they at the same time give the privilege of imitating them. Thus, from the highest to the lowest is a systematic corruption communicated, and it becomes general in all classes.

4 **Hyacinthe Rigaud, portrait of Louis XIV, 1701.** This was one of Louis XIV's favorite portraits of himself. He liked it so much that he had many copies of the portrait made; his successors had their own portraits painted in the same posture with the same clothing and accoutrements.

ANALYZING THE EVIDENCE

1. What elements of royal authority does the portrait of Louis XIV in Source 4 present to viewers? How would you compare this depiction of political power with images of modern-day politicians? How would you explain the differences?

2. What justification do the sources offer for Louis's claim to exercise "absolute" political authority? Based on his own words in Source 3, how do you think Louis would have viewed the constitutional governments of England and the Dutch Republic?
3. Compare and contrast the evidence for Louis's power given in these sources with evidence for limitations on it. What resources would a king have to muster to enlarge his army drastically (Source 5)? What insight do the negotiations over taxation (Source 2) give you into the ways the royal government acquired those resources?

PUTTING IT ALL TOGETHER

The Wars of Louis XIV

Louis XIV kept France at war for thirty-three of the fifty-four years of his personal rule. Under the leadership of François le Tellier, marquis de Louvois, Louis's secretary of state for war, France acquired a huge professional army. The French army almost tripled in size. Uniforms and weapons were standardized, and a system of training and promotion was devised. As in so many other matters, Louis's model was emulated across Europe, resulting in a continent-wide transformation in military capability that scholars have referred to as a "military revolution."

During this long period of warfare, Louis's goal was to expand France to what he considered its natural borders and to win glory for the Bourbon dynasty. His results were mixed. During the 1660s and 1670s, French armies won a number of important victories. The wars of the 1680s and 1690s, however, brought no additional territories and placed unbearable strains on French resources.

Louis's last war, the War of the Spanish Succession (1701–1713), was endured by a French people suffering high taxes, crop failure, and widespread malnutrition and death. This war was the result of Louis's unwillingness to abide by a previous agreement to divide Spanish possessions between France and the Holy Roman emperor upon the death of the childless Spanish king Charles II (r. 1665–1700). In 1701 the English, Dutch, Austrians, and Prussians formed the Grand Alliance against Louis XIV. War dragged on until 1713, when it was ended by the Peace of Utrecht (Map 18.3).

Mapping the Past

MAP 18.3 Europe After the Peace of Utrecht, 1715 The series of treaties commonly called the Peace of Utrecht ended the War of the Spanish Succession and redrew the map of Europe. A French Bourbon king succeeded to the Spanish throne. France surrendered the Spanish Netherlands (later Belgium), then in French hands, to Austria and recognized the Hohenzollern rulers of Prussia. Spain ceded Gibraltar to Great Britain, for which it has been a strategic naval station ever since. Spain also granted Britain the *asiento*, the contract for supplying African slaves to America.

ANALYZING THE MAP Identify the areas on the map that changed hands as a result of the Peace of Utrecht. How did these changes affect the balance of power in Europe?

CONNECTIONS How and why did so many European countries possess scattered or discontiguous territories? What does this suggest about European politics in this period? Does this map suggest potential for future conflict?

The Peace of Utrecht marked the end of French expansion. Thirty-three years of war had given France the rights to all of Alsace and some commercial centers in the north. But at what price? At the time of Louis's death in 1715, an exhausted France hovered on the brink of bankruptcy.

The Economic Policy of Mercantilism

France’s ability to build armies and fight wars depended on a strong economy. Fortunately for Louis, Jean-Baptiste Colbert (1619–1683) brilliantly occupied the position of controller general of finance from 1665 to 1683. Colbert’s central principle was that the wealth and the economy of France should serve the state. To this end, Colbert rigorously applied mercantilist policies to France.

Mercantilism is a collection of governmental policies for the regulation of economic activities by and for the state, with the aim of increasing state power. It derives from the idea that a nation’s international power is based on its wealth, specifically its supply of gold and silver. To accumulate wealth, a country always had to sell more goods abroad than it bought from foreign countries.

mercantilism A system of economic regulations aimed at increasing the power of the state derived from the belief that a nation’s international power was based on its wealth, specifically its supply of gold and silver.

To increase exports, Colbert supported old industries and created new ones. He enacted new production regulations, created guilds to boost quality standards, and encouraged foreign craftsmen to immigrate to France. To encourage the purchase of French goods, he abolished many domestic tariffs and raised tariffs on foreign products. In 1664 Colbert founded the Company of the East Indies with hopes of competing with the Dutch for Asian trade. Colbert also sought to increase France’s control over and presence in New France (Canada) (see “Colonial Empires of England and France”).

During Colbert’s tenure as controller general, Louis was able to pursue his goals without massive tax increases and without creating a stream of new offices. The constant pressure of warfare after Colbert’s death, however, undid many of his economic achievements.

The Austrian Habsburgs

Absolutism was also the dominant form of monarchical rule among the more than one thousand states that composed the Holy Roman Empire. Prussia, a minor power with scattered holdings, emerged in the seventeenth and eighteenth centuries under the Hohenzollern dynasty as a major rival to the Austrian Habsburg dynasty (see “Enlightened Absolutism and Its Limits” in Chapter 19). Like all of central Europe, the Austrian Habsburgs emerged from the Thirty Years’ War impoverished and exhausted. Their efforts to destroy Protestantism in the German lands and to turn the weak Holy Roman Empire into a real state had failed. Defeat in central Europe encouraged the Austrian Habsburgs to turn away from a quest for imperial dominance and to focus inward and eastward in an attempt to unify their diverse holdings.

Habsburg victory over Bohemia during the Thirty Years' War was an important step in this direction. Ferdinand II (r. 1619–1637) drastically reduced the power of the Bohemian Estates, the largely Protestant representative assembly. He also confiscated the landholdings of Protestant nobles and gave them to his supporters. After 1650 a large portion of the Bohemian nobility was of recent origin and owed its success to the Habsburgs.

With the support of this new nobility, the Habsburgs established direct rule over Bohemia. Under their rule, the condition of the serfs worsened substantially. The Habsburgs also successfully eliminated Protestantism in Bohemia. These changes were important steps in creating absolutist rule.

Ferdinand III (r. 1637–1657) continued to build state power. He centralized the government in the empire's German-speaking provinces, which formed the core Habsburg holdings, and established a permanent standing army. The Habsburg monarchy then turned east toward Hungary, which had been divided between the Ottomans and the Habsburgs in the early sixteenth century. Between 1683 and 1699 the Habsburgs pushed the Ottomans from most of Hungary and Transylvania. The recovery of all of the former kingdom of Hungary was completed in 1718.

Austrian Expansion, to 1699

Despite its reduced strength, the Hungarian nobility effectively thwarted the full development of Habsburg absolutism. Throughout the seventeenth century Hungarian nobles periodically rose in revolt against the Habsburgs. In 1703, with the Habsburgs bogged down in the War of the Spanish Succession, the Hungarians rose in one last patriotic rebellion under Prince Francis Rákóczy (RAH-coht-see). Rákóczy and his forces were eventually defeated, but the Habsburgs agreed to restore many of the traditional privileges of the Hungarian aristocracy in return for the country's acceptance of Habsburg rule.

Elsewhere, the Habsburgs made significant achievements in state-building by forging consensus with the church and the nobility. A sense of common identity and loyalty to the monarchy grew among elites in Habsburg lands. German became the language of the state, and Vienna became the political and cultural center of the empire.

The Absolutist Palace

In 1682 Louis moved his court and government to the newly renovated palace at Versailles (vayr-SIGH), in the countryside southwest of Paris. The themes of the interior paintings and the sculptures in the gardens hailed Louis's power, with images of the Roman gods Apollo (the sun god) and Neptune (the sea god) making frequent appearances. The gardens' rational orderliness and symmetry showed that Louis's force extended even to nature, while their terraces and waterworks served as showcases for the latest techniques in military and civil engineering.

The palace quickly became the center of political, social, and cultural life, and all high-ranking nobles were required to spend at least part of the year in residence. Louis established an elaborate set of etiquette rituals for courtiers that encompassed every moment of his day, from waking up and dressing in the morning to removing his clothing and retiring at night. These rituals were far from meaningless or trivial. The king controlled immense resources and privileges; access to him meant favored treatment for government offices, military and religious posts, state pensions, honorary titles, and a host of other benefits.

A system of patronage — in which a higher-ranked individual protected a lower-ranked one in return for loyalty and services — flowed from the court to the provinces. Through this mechanism Louis gained cooperation from powerful nobles. Although they were denied public offices and posts, women played a central role in the patronage system. At court the king's wife, mistresses, and other female relatives recommended individuals for honors, advocated policy decisions, and brokered alliances between noble factions.

With Versailles as the center of European politics, French culture grew in international prestige. French became the language of polite society and international diplomacy, and France inspired a cosmopolitan European culture in the late seventeenth century that looked to Versailles as its center. Moreover, Louis's rival European monarchs soon followed his example, and palace building became a Europe-wide phenomenon.

Constitutionalism and Empire in England and the Dutch Republic

Why and how did the constitutional state triumph in England and the Dutch Republic?

While most European nations emerged from the crises of the seventeenth century with absolutist forms of government, England and the Netherlands evolved toward **constitutionalism**, which is the limitation of government by law. Constitutionalism also implies a balance between the authority and power of the government, on the one hand, and the rights and liberties of the subjects, on the other.

constitutionalism A form of government in which power is limited by law and balanced between the authority and power of the government, on the one hand, and the rights and liberties of the subject or citizen, on the other; it includes constitutional monarchies and republics.

After decades of civil war, the English briefly adopted **republicanism**, a form of government in which there is no monarch and power rests in the hands of the people as exercised through elected representatives. Finally, in 1688 the English settled on a lasting political solution, constitutional monarchy. Under this system of government, England retained a monarch as the titular head of government but vested sovereignty in an elected parliament. For their part, the Dutch rejected monarchical rule in 1648, when their independence from Spain was formally recognized. Instead they adopted a republican form of government in which elected Estates (assemblies) held supreme power. Neither the English nor the Dutch were democratic by any standard, but to other Europeans, they were shining examples of the restraint of arbitrary power and the rule of law.

Religious Divides and Civil War

In 1603 beloved Queen Elizabeth was succeeded by her Scottish cousin James Stuart, who ruled England as James I (r. 1603–1625). Like Louis

XIV, James believed that a monarch had a divine right to his authority and was responsible only to God. James I and his son Charles I (r. 1625–1649) considered any legislative constraint on their power a threat to their divine-right prerogative. Consequently, at every meeting of Parliament between 1603 and 1640, bitter squabbles erupted between the Crown and the House of Commons.

Religious issues also embittered relations between the king and the House of Commons. In the early seventeenth century many English people felt dissatisfied with the Church of England. Calvinist **Puritans** wanted to take the Reformation further by "purifying" the Anglican Church of Roman Catholic elements, including crown-appointed bishops, elaborate ceremonials, and wedding rings. James I responded to such ideas by declaring, "No bishop, no king." His son and successor, Charles I, further antagonized subjects by marrying a French Catholic princess and supporting the high-handed policies of archbishop of Canterbury William Laud (1573–1645). Political and religious conflict in this period was exacerbated by economic distress caused by severe weather conditions and periodic bouts of plague.

Puritan Occupations These twelve engravings depict typical Puritan occupations and show that the Puritans came primarily from the artisan and lower middle classes. The governing classes and peasants made up a much smaller percentage of Puritans, and most generally adhered to the traditions of the Church of England.

Charles avoided direct confrontation with his subjects by refusing to call Parliament into session from 1629 to 1640, instead financing the realm through extraordinary stopgap levies considered illegal by most English people. However, when Scottish Calvinists revolted against his religious policies, Charles was forced to summon Parliament to obtain funding for an army to put down the revolt. Angry with the king's behavior and sympathetic with the Scots' religious beliefs, the House of Commons passed the Triennial Act in 1641, which compelled the king to call Parliament every three years. The Commons also impeached Archbishop Laud and then threatened to abolish bishops. King Charles, fearful of a Scottish invasion, reluctantly accepted these measures. The next act in the conflict was precipitated by the outbreak of rebellion in Ireland. In 1641 the Catholic gentry of Ireland led an uprising in response to a feared invasion by British anti-Catholic forces.

Without an army, Charles I could neither come to terms with the Scots nor respond to the Irish rebellion. After a failed attempt to arrest parliamentary leaders, Charles left London and began to raise an army. In response, Parliament formed its own army, the New Model Army.

The English civil war (1642–1649) pitted the power of the king against that of Parliament. After three years of fighting, Parliament’s army defeated the king’s forces at the Battles of Naseby and Langport in the summer of 1645. Charles refused to concede defeat, and both sides waited for a decisive event. This arrived in the form of the army under the leadership of Oliver Cromwell, a member of the House of Commons and a devout Puritan. In 1647 Cromwell’s troops captured the king and dismissed members of the Parliament who opposed Cromwell’s actions. In 1649 the remaining representatives, known as the Rump Parliament, put Charles on trial for high treason. Charles was found guilty and beheaded on January 30, 1649.

The Puritan Protectorate

With the execution of Charles, the monarchy was abolished and a commonwealth, or republican government, was proclaimed. Theoretically, legislative power rested in the surviving members of Parliament, and executive power was lodged in a council of state. In fact, the army that had defeated the king controlled the government, and Oliver Cromwell controlled the army. Though called the Protectorate, the rule of Cromwell (1653–1658) was a form of military dictatorship. Reflecting Puritan ideas of morality, Cromwell’s state forbade sports, kept the theaters closed, and rigorously censored the press.

On the issue of religion, Cromwell favored some degree of tolerance, and all Christians except Roman Catholics had the right to practice their faiths. Cromwell had long associated Catholicism in Ireland with sedition and heresy, and he led an army there to reconquer the country in August 1649. Following Cromwell's reconquest, the English banned Catholicism in Ireland, executed priests, and confiscated land from Catholics for English and Scottish settlers.

The Protectorate collapsed when Cromwell died in 1658 and his ineffectual son succeeded him. Fed up with military rule, the English longed for a return to civilian government. By 1660 they were ready to restore the monarchy.

Constitutional Monarchy

The Restoration of 1660 brought to the throne Charles II (r. 1660–1685), the eldest son of Charles I. Both houses of Parliament were also restored, as was the Anglican Church. However, Charles was succeeded by his Catholic brother James II, arousing fears of a return of Catholicism. A group of eminent persons in Parliament and the Church of England wrote to James's Protestant daughter Mary and her Dutch husband, Prince William of Orange, inviting them to invade and take the throne of England. In November 1688 William arrived on the English coast with five hundred ships and over twenty thousand soldiers, causing James II, his queen, and their infant son to flee for France. Early in 1689 William and Mary were jointly crowned as king and queen of England.

The English called the events of 1688 and 1689 the Glorious Revolution because they believed it replaced one king with another with barely any bloodshed. In truth, William's arrival sparked riots and violence across the British Isles and in North American cities such as Boston and New York. Uprisings by supporters of James, known as Jacobites, occurred in 1689 in Scotland. In Ireland the two sides waged outright war from 1689 to 1691. William's victory at the Battle of the Boyne (1690) and the subsequent Treaty of Limerick (1691) sealed his accession to power.

In England the revolution represented the final destruction of the idea of divine-right monarchy. The men who brought about the revolution framed their opposition to Stuart-style absolutism in the **Bill of Rights of 1689**, which was passed by Parliament and formally accepted by William and Mary. Law was to be made in Parliament; once made, it could not be suspended by the Crown. Parliament had to be called at least once every three years. The Bill of Rights also established the independence of the judiciary and mandated that there be no standing army in peacetime.

Protestants could possess arms, but the Catholic minority could not. Catholics could not inherit the throne. Additional legislation granted freedom of worship to Protestant dissenters but not to Catholics.

Bill of Rights of 1689 A bill passed by Parliament and accepted by William and Mary that limited the powers of British monarchs and affirmed those of Parliament.

The Glorious Revolution and the concept of representative government found its best defense in political philosopher John Locke's *Second Treatise of Civil Government* (1690). Locke (1632–1704) maintained that a government that oversteps its proper function — protecting the natural rights of life, liberty, and property — becomes a tyranny. Under a tyrannical government, he argued, the people have the natural right to rebellion.

Although the events of 1688 and 1689 brought England closer to Locke's ideal, they did not constitute a democratic revolution. The Glorious Revolution placed sovereignty in Parliament, and Parliament represented the upper classes.

The Dutch Republic

In the late sixteenth century the seven northern provinces of the Netherlands fought for and won their independence from Spain. The independence of the Republic of the United Provinces of the Netherlands was recognized in 1648 in the treaty that ended the Thirty Years' War. In this period, often called the "golden age of the Netherlands," Dutch ideas and attitudes played a profound role in shaping a new and modern worldview. At the same time, the United Provinces developed its own distinctive model of a constitutional state.

Rejecting the rule of a monarch, the Dutch established a republic, a state in which power rested in the hands of the people and was exercised through elected representatives. Other examples of republics in early modern Europe included the Swiss Confederation and several autonomous city-states of Italy and the Holy Roman Empire. Among the Dutch, an oligarchy of wealthy businessmen called regents handled domestic affairs in each province's Estates, or assemblies. The provincial Estates held virtually all the power. A federal assembly, or States General, handled foreign affairs and war, but all issues had to be referred back to the local Estates for approval, and each of the seven provinces could veto any proposed legislation. Holland, the province with the largest navy and the most wealth, usually dominated the republic and the States General.

In each province, the Estates appointed an executive officer, known as the stadholder. Although in theory the stadholder was freely chosen by the Estates, in practice the reigning prince of Orange usually held the office of stadholder in several of the seven provinces of the republic. Tensions persisted between supporters of the House of Orange and those of the staunchly republican Estates, who suspected the princes of harboring monarchical ambitions. (See “Analyzing the Evidence: Gonzales Coques, *The Young Scholar and His Wife,*” page 518.)

Global trade and commerce brought the Dutch the highest standard of living in Europe, perhaps in the world. Salaries were high, and all classes of society ate well. Consequently, the Netherlands experienced very few of the riots and popular revolts that characterized the rest of Europe.[2] The moral and ethical bases of Dutch commercial wealth were thrift, frugality, and religious tolerance. Jews enjoyed a level of acceptance and assimilation in Dutch business and general culture unique in early modern Europe. (See “Individuals in Society: Glückel of Hameln,” page 520.) In the Dutch Republic tolerance not only seemed the right way but also contributed to profits by attracting a great deal of foreign capital and investment.
